PIG IRON—The market is virtually unrhanged, hut in view of decreasing stocks in England and improving markets at the East. The New York *Iron Age*, Oct. 20th, says: "It is hecoming more and more evident that current consumption is enormous, greater hy far than even the sanguine expected. The low prices so long prevailing are evidently aiding iron and steel to enter into many channels. The one conspicuous exception is the rail trade, which is langkishing, so far as orders are concerned. Reports from the leading primary pig-iron markets are decidedly encouraging. While occasionally low prices do crop up, it is unquestionably true that sellers are in a hetter position than they have heen at any time this year, and it is not impossihle that the modest advance of 25c on foundry and forge grades may he secured at an early date."

TIN—Trade is quiet, hut the market is quoted fairly steady. New York advices report that a hull campaign appears to he shaping itself under the "old dealer" and his assistants. London cahles report as follows: "Operations in pig tin have continued on a quite liheral scale, and under the influence of good purchases for America and the continent. Business in tin plate has heen quiet and the Swansea market is easier. Business at the quarterly meeting was meager, prices offered not meeting makers' views. Uncertainty regarding the Presidential election in America also retards husiness."

COPPER—The market has strengthened, owing to the decision to close down the Anaconda mine on November 10th for a period of three months. The mine is the greatest producer in the world, having a record of having made over 12,000,000 lhs. in a single month. Mail advices from New York state that the statement is also going the rounds that the leading lake companies will ship no copper after the close of navigation except on orders, and that consumers who do not place orders in advance may he inconvenienced. Back of this come intimations that deals are working in the market for copper-mine shares, and that more or less maneuvering is going on with a view to helping operations in that line. In other words, there is a broad insinuation of stock-jobbing, in which some handlers of the metal are deeply interested.

COAL—Imports the past week aggregate as follows: Nanaimo, 3153 tons; Departure Bay, 7699; Tacoma, 8300; Cardiff, 5984; Seattle, 680; Newcastle, N. S. W., 3700; Liverpool, 2300; Swansea, 1765; Coos Bay, 500. Total, 34,077 tons. The market has held steady throughout the week. Heavy imports the past two weeks have not had any visihle effect on the market, owing to the foreign having heen cared for. High outward freights at Australia and English ports are against forward shipments except at an advance, while the tonnage on the way is lessening.

Eastern Metal Markets.

NEW YORK, Oct. 26.—The following ara tha closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	39 5-16	85¼	11 65	3 90	20 70
Friday.....	39 7-16	.....	.....	.....	.....
Saturday.....	39 7-16	86	11 65	3 93	20 70
Monday.....	39 7-16	86¼	11 65	3 80	20 60
Tuesday.....	39 5-16	85¼	11 75	3 80	20 60
Wednesday....	39½	85¾	11 75	3 80	20 55

For copper 12c is quite generally asked. There is every indication that prices will be better. It is certain that prominent producers are prophesying 12½c for lake brands after November 1st. Pig iron is active Lead is weak. Pig tin is under manipulation. Quicksilver shows a slight gain, in sympathy with a better London rating; New York quotes 53½@54o.

Mining Share Market.

SAN FRANCISCO, Oct. 27, 1892.

The market has heen fairly active the past week in the Comstocks, hut dull and heavy in the outsiders. Belcher was the leader in the former—and the lively fluctuations were reminders of the gamhling days long gone hy. The fluctuations in Belcher ranged around 20 per cent, which gave turn-takers rare opportunities of making money, hut at the same time, these very fluctuations made dealing hazardous, particularly when huying on margin.

As yet the public has not taken kindly to the game; this is shown hy the small attendance in the two hoards, and also at the various "tickers." As a rule, very few, if any, persons of means, or, as for that, of limited means are to he seen watching the moves, for experience has taught them to let severely alone other persons' games where it is "head the insider wins and tails the outsider loses." It is a great game, this; and only a master hand at concocting the most harefaced swindling prospectus could have conceived it. The mines are, it is said hy experienced miners, worked almost entirely, if not altogether, to correspond to the game run on Pine street, and not, as they should he, in the interest of shareholders. At times even the mill rings are fooled hy the work in the mines, for often ore is struck hefore desired or else it takes longer to run for it than had heen estimated, either of which interferes, temporarily of course, with their projects; hut this obstacle has heen or is heing corrected hy having miners at important points who know nothing, or in other words, who give only that away which the rings wish to have known. Is it to he wondered at that dealing in mining shares has lost caste with persons having any regard for their social and financial standing? The fact that it is hullion for insiders and assessments for outsiders was hut well estahlished hy the suit of M. W. Fox against the late directors of the Hale & Norcross Mining Company; and it is this knowledge on the outside which makes it the more difficult to draw gudgeons into the net.

Why do not the mill rings have the mines worked and the ore milled to conform to the law under which the companies incorporated, so that *all* hullion will he turned over to the companies? The way in which the business has heen conducted has not only killed the mining share market, hut has nearly ruined the mining industry of the coast.

In justice to the new hoard of directors of the Savage Co. and to all others in interest, the writer will state that H. Zadig says he has not heen a director in the company for about nine months. This carries it hack to the time when H. M. Levy, of the Hale & Norcross notoriety, was president of the Savage Co., and who, it is said, was compelled to resign from the latter company.

About one week hefore the mining share market reached the highest figures in last month, the Virginia *Enterprise* came out in a full report on the work in several of the mines, from which we excerpt the following: "The management (Belcher) is now running a west crosscut on the 400 level with the hope of tapping an extension of ore from the 300 level. There is a chance for an ore-hody in the neighborhood toward which the crosscut is heing pushed, and a development of importance may he made there in the near future. In the Crown Point a 3-foot streak of fair-milling ore is heing followed south on the 3d floor of the 160-level stopes. Besides this, some ore is heing found in places on the 230 level and saved. These are small profits, perhaps, and do not figure much in the stock market or the expenses of the mine, hut they are a showing and may expand into something of more magnitude at any time. There is hoth fair-grade ore and low-grade quartz in sight at the Justice. There is a vein of $25 ore three feet wide in the stopes on the 820 level, 50 feet up from the track floor. The low-grade quartz is in the top of the raise from the south winze from the 620 level. This quartz may run into something hetter in the course of future work. In the Kentuck a pay streak in the north drift from the east crosscut on the 160 level is heing developed. The extent of this streak will he hetter known as developed. The scale of operations at the Yellow Jacket is slowly enlarging, and the working of the mine on the same hasis as hefore the recent draft, will soon he resumed. This only awaits the raising of the Carson river. Preparations for pumping in the joint Belcher and Crown Point incline are coming to a focus, and a more decided movement in that quarter will soon be in order. The sinking pump there will he started as soon as the compressed air and water-pipe fittings are ready, which work will he completed presently. A greater interest will he manifested in Crown Point operations as soon as the water has heen dropped to the lower levels. Deep-mining there may do something for the lode. Who can tell? Developments of importance on the 1800 level of the Hale & Norcross, in the same neighborhood in the Con. Virginia and on the 2000 of the Crown Point would revive the Comstock in a way that would make the oldtimers think the palmy days were returning."

It seems needless to say that after the market had heen to the highest figures, the above information was forgotten and, instead, the papers harped about water, porphyry, etc.; hut now that the rings have squeezed all the shares out of the public that it has heen possihle to do, and an upmove is in contemplation to again play the old game, it is quite likely that the above information will he again hrought out and perhaps enlarged to suit the purposes of the rings, so as to catch gudgeons.

Yesterday, Mr. Hughes, a well-known mining-share operator, offered to give a dealer 500 shares in any mine controlled hy Bob Morrow, if he, the dealer, would pay him, Mr. Hughes, the assessments that would he levied hy the company for one year—and Mr. Morrow is the reported hroker for D. O. Mills.

Seemingly reliable advices from the Comstock mines report that on the 1800-foot Ward shaft level connection will soon be made with Potosi. This is quite important, for it will give excellent ventilation and admit of successfully developing the west lode at that depth. The Sierra Nevada drift has heen turned south so as to intercept at that depth the ore found to the west in Iowa Hill. In Belcher they are still pushing the north lateral drift on the 400-foot level. On this level they are running a west crosscut about 80 feet from point of starting the drift. When they strike the west lode work will prohahly

be stopped, and the crosscut, as has been the case before, be declared a failure, provided they are not ready to sell shares. They are milling ore from the Yellow Jacket, Challenge and Con. Imperial. In Belcher they are sinking on the 300-foot level. News from other mines is of an important character, but this will probably be more than offset by assessments in the near future.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 18, 1892.

484,726 —RANGE-FINDER—C. M. Allen, S. F.

484,513.—WHEAL CULTIVATOR—D. E. Barton, S. F.

484,727.—GAS ENGINE—Dau'l Best, San Leandro, Cal.

484,728.—GAS-ENGINE MOTOR — Dan'l Best, San Leandro, Cal.

484,729.—LUBRICATOR—Dan'l Best, San Leandro, Cal.

484 732.—DOMPING-WAOON—L. Busse, S. F.

484,408.—CONNECTING-PIPES—A. Clancy, San Diego, Cal.

484,656.—COUPLING—I. P. Doolittle, Redlands, Cal.

484,706.—TRAMWAY SWITOH—J. H. Gagle, Seattle. Wash.

484,552.—ELASTIC CUSHION FOR HUBS—J. R. Gleeson, Chico, Cal.

484,735.—BITUMINOUS-ROCK MACHINE—Hall & Wood, Oakland, Cal.

484,424.—RAILWAY RAIL JOINT—G. W. Hanner, Holbrook, A. T.

484,739.—HARROW—T. J. Hubbell, San Bernardino, Cal.

484,741.—TILE—R. E. Hunn, Vallejo, Cal.

484,505.—MILKING-MACHINE—J. C. McCollum, Los Angeles, Cal.

484,459.—STRAINER—Mary B. Reynolds, Tacoma, Wash.

484,724.—ELECTAIC MOTOR—A. W. Smith, S. F.

484,473.—RIVETING-MACHINE—F. H. Steelow, Los Angeles, Cal.

484,748.—COPYING-PRESS—E. F. Verrill. S. F.

484,478.—FLOUR-REAL MACHINE—J. A. Wahlstrom, Salem, Or.

21,902.—DESIGN FOR CUFF-BUTTON—J. A. Bidwell, Pomona, Cal.

21 906.—DESION FOR ELECTRIC-DYNAMO FRAME, G. B. Fraley, S. F.

The following brief list by telegraph, for Oct. 26, will appear more complete on receipt of mail advices:

WASHINGTON, October 25th.—Pacific Coast patents issued to-day: John H. Bates, Santa Barbara, washing machine; John Burns, Los Angeles, fruit-cutting machine; Arnold Kempe, Oakland, bicycle; John H. Kruz and M. K Shipley, Oswego, Oregon, feeder for baling-presses; Winfield S. Miller, Milpitas, Cal., cultivator; Austin A. Pratt, Independence, Oregon, potato-digger; Emery E. Smith, Palo Alto, label-holder; H. P. Bennett, Phœnix, A. T., excavator; A J. Taylor, Silver City, Nev., grinding pan.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AOXILIARY VALVE FOR ELEVATORS.—Alexander J. McAdam, San Francisco. No. 484,223. Dated Oct. 11, 1892. This invention relates to a novel auxiliary valve for elevators and the mechanism for operating it. The object is to provide simple and effective means for operating the main valve from the cage or car.

DOMPING WAOON.—Leopold Busse, S. F. No. 484.732. Dated Oct. 18, 1892. This is one of that class of dumping-wagons in which the bottom-boards are hinged to the lower edges of the sides, whereby said boards move to and fro from the center to close and open the bottom. The invention consists in the novel arrangement and construction of the support for holding the bottom-boards and relieving them and in the connections by which said supports are operated.

DESIGN FOR AN ENGINE FEAME.—Daniel Best, San Leandro. No. 21,887. Dated Oct. 11, 1892. The leading feature of this design is the peculiar outline of the frame in which the two opposing cylinders are fixed, the frame having a peculiar, irregular, trough-shape from the ends to the center, and having the two ends out of line with each other in a vertical plane.

FASTENER FOR THE MEETING-RAILS OF SASHES. James C. Plunkett, Oakland. No. 484 235. Dated Oct. 11, 1892. The invention relates to certain improvements in devices for locking and securing window-sashes with relation to each other. It consists of two plates—one fixed to the upper and the other to the lower sash. One of these plates has a bar hinged to it so that it may be raised into a vertical position or turned down into a horizontal position, and it has a swivel link connected with it which is adapted to hook over a lug upon the opposite plate when the bar is raised up, and to lock with the lug when it is thrown down. A spring latch holds the bar in this position and prevents its being raised from the outside. When it is desired to partially open a window and lock it, a plate is fixed to the top of the lower sash near one end, having two bars hinged to it so as to fold down across each other. Slotted plates are fixed to the vertical side of the upper sash and to the window-casing, having lugs at intervals, to either of which the links on the bars may be locked and the sashes thus retained at any point, when open, as securely as when entirely closed.

CONTINUOUS KILN.—Wm. Radford, San Jose, No. 484,237. Dated Oct. 11, 1892. The object of this invention is to make certain improvements in that class of kilns comprising a series of successive adjacent chambers into which the wares to be burned are placed. It consists in a means of more effectively applying the heat to various parts of the burning-chambers when in operation and a means for transferring a portion of the heat from the completed wares to chambers containing unburned wares, whereby greater economy of fuel and effectiveness of work are produced.

WOODEN LIQUID-CONTAINING VESSEL.—James M. Schofield, Merced, assignor of one-half to F. S. O'Brien. No. 484,249. Dated Oct. 11, 1892. This is one of that class of vessels made of separate section pieces or staves of wood and designed to hold liquids, such vessels, for example, as casks, barrels, kegs, tanks, etc. The invention consists in seating in the joints of such vessels pieces or strips of absorbent material, and its object is by keeping said material wet to introduce and maintain moisture in the joints to swell them and keep them tight, thus avoiding leakage by shrinkage.

CULTIVATOR AND PULVERIZER. — C. C. Reynolds, Kelseyville, Lake county, assignor of one-half to J. C. Plunkett, Oakland. No. 484,239. Dated Oct. 11, 1892. This apparatus consists of cultivator-teeth adjustably mounted and supported from a traveling sulky frame, and in conjunction therewith, of an adjustable crushing roller peculiarly constructed. The roller is preferably made with elastic plates, hinged to it in such a manner that these plates serve as crushers or rubbers when they pass over the cultivator-teeth by the rotation of the roller. The advantage of hinging these plates and making them elastic is specially seen where there are rocks or substances which cannot be crushed, and if these pass between any one of the elastic plates and the cultivator, that plate will yield sufficiently to leave space for the rock to pass, while the remainder of the plates, encountering only the material which can be crushed, will continue to act upon the material and crush it without reference to the size of the stone which may be passing under the other plate. Without the use of these elastic plates the whole roller would be lifted by such a rock and any clods that might be passing through other parts of the roller at such a time would escape without being crushed.

LUBRICATOR.—Daniel Best, San Leandro. No. 484,729. Dated Oct. 18, 1892. This is a novel device which is especially applicable for lubricating the movable parts of steam and gas engines, and for other apparatus in which the action of the lubricator is regulated by the movement of the machinery itself. The patent covers certain details of construction.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

OREGON BITOMINOUS ROCK COMPANY. Capital stock, $500,000. Directors—John Bays, Ferdinand Smith, Martin Weston, Elias Groat and John W. Nye.

THE BANK OF SAN LUIS ORISPO (San Luis Ohispo). Capital stock, $300,000. Directors—J. P. Andrews, R. E. Jack, William L. Beebe, W. H. Spencer and Nathan Goldtree.

CENTRAL CALIFORNIA CONSOLIDATED LAND AND WATER COMPANY. Capital stock, $1,000,000. Directors—Eugene J. Gregory, J. C. Sala, G. W. Lnce, J. Berton and A. B. Summers.

SAN LUIS ORISPO COUNTY NURSERY COMPANY (Paso Robles, San Luis Obispo County). Capital stock, $60,000. Directors—R. C. Stubblefield, L. C. Rice, C. A. Runnels, R. Butcher and H. C. Fry.

THE DUNCAN GOLD CURE COMPANY (Oakland). Capital stock, $25,000. Directors, J. G. Hoyt, E. S. Finch, W. H. Stinger, C. F. Baker and B. S. Power.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

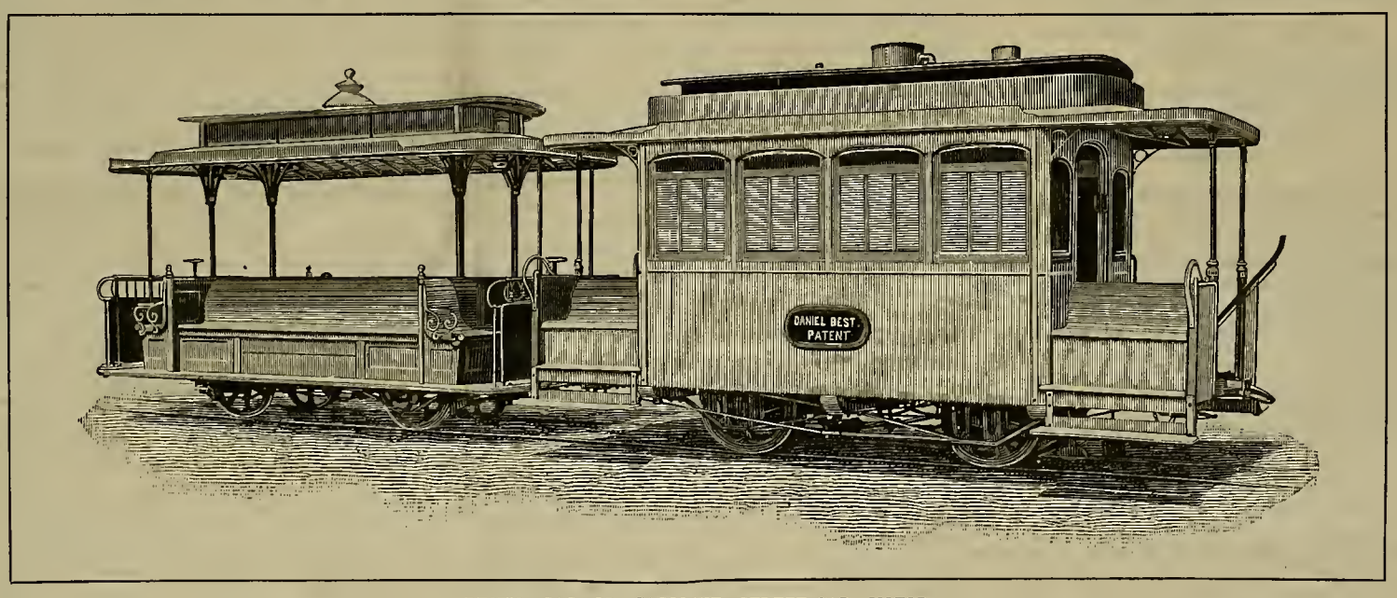
Gas or Gasoline Engines for Road Motors.

The increase of homes adjacent to cities has set inventive genius to work on the problem of safe and cheap motive power to propel cars on railway lines which extend in a radius of from five to ten miles around our cities and towns. A convenient and cheap motor is the gas vapor or gasoline engine. A practical application of this form of motive power to street car lines has been made by Mr. Daniel Best, of San Leandro, Alameda county. Some time in last January a railway line was projected from the terminus of the electric car line at San Jose to run out to Alum Rock Park, eight miles from San Jose, at the foot of Mt. Hamilton. This line has been completed for four miles and is now being built the entire distance. The Best gasoline engine is the motive power for conveying passenger and construction cars over this line.



BEST'S GAS OR GASOLINE STREET-CAR MOTOR.

The Best vapor engine as applied on this line is a double-ender, the piston of each cylinder being connected with the main shaft. Each connects direct with the forward car axle by an endless chain. The number of revolutions per minute are 200 of the engine, and of the wheels of the car 100 per minute. The wheels are 30 inches in diameter; this gives a speed of 12 miles per hour. The speed of the engine can be varied at the will of the operator from 75 to 250 revolutions per minute. The engine is geared to the axle of the car direct from the crank-shaft, and at one side there is an intermediate gear which drives one set of wheels in the opposite direction from the crank-shaft. There is but one pair of wheels working at a time; one pair run one way and the other the opposite way.

The cost of operation is stated to be as follows: 9 gallons gasoline, at 14 cents per gallon, $1.26; 1 quart lubricating oil, at 10 cents, 10 cents; total, $1.36 per day.

The gas is all consumed and consequently there is no need of using any disinfectant, as there is no offensive smell whatever.

Mr. G. W. Dolly, the present engineer, who has been continuously in charge for the last three months, says: "We usually run eight miles an hour and from 10 to 14 hours per day, part of the time being consumed in hauling out the construction train loaded with gravel. In a cut on quite a sharp hill toward the mountain the up grade is four per cent; consequently, on the down grade, as you see, I throw off the current and move along at any speed I wish by natural gravitation."

There is no noise caused by the explosion of the gas that can be heard on the rear car, and the rumbling of car wheels is all of the noise that can be distinguished outside of the car containing the motor. The motor runs smoothly, without jerk or jar, and there is no inconvenience to passengers from smoke or disagreeable smell. On Sundays and holidays two passenger cars are attached to the motor car and from 70 to 100 passengers are carried at one load. The brakes are so constructed that the car can be stopped under full motion within five feet. The size of the car is 7x11 feet. Other suburban railway lines have been projected, but it seems that the problem of cheap transportation in this field has been settled by the improved Best gas or gasoline engine or motor. The cut shown on this page is made from a photograph recently taken and is an exact copy of the motor car and passenger car as it appears at the end of the line. We shall watch with interest the progress made in this new line of industry and from time to time shall note the progress, improvements and success attending the new feature in suburban railway lines.

At the Peacock mine, in the Mogollons, N. M., in pumping the mine out, the lessees were agreeably surprised when they started up, for the old pump in the mine which had been submerged for four years started pumping without any bother. Another pump had been procured and put in place; but the old one, although drowned, was unlike McGinty, for it had its working clothes on.

The Comstock Pumping Association has levied another assessment aggregating $25,000 upon the Gold Hill mining companies which comprise it, apportioned in amounts ranging from $1250 to $3750 per company. This is the seventeenth assessment since pumping operations began, and the amount of the assessments levied is $425,000.

The annual assemblage of the miners of the Southwest will take place in El Paso, N. M., on December 5th. It will be practically a silver convention.

Grinding-Pan for Ore.

Albert J. Taylor, of Silver City, Lyon Co., Nev., has obtained a patent through the Mining and Scientific Press Patent Agency for a grinding-pan for ores which has some new features in the arrangement of the grinding-rollers. A ring-die extends around the inner periphery of the inclined sides of the pan and against these and upon the bottom dies the crushing and grinding takes place. Heretofore, it has been customary to employ a series of rollers set within the pan so that their peripheries roll against the side-die; but the irregularity of the pressure and the amount of material which comes between the dies and rollers is such that after a short use the dye will be worn into wavy surfaces, the irregularity of which is such that, if the pan is run at any reasonable degree of speed, it will throw the rollers entirely out of place, and the pans become practically useless so soon that this style has been altogether abandoned.

In this invention Mr. Taylor employs one or more horizontal rollers lying on the side of the bottom-die and having their ends adapted to travel against the side-die. These rollers are placed at intervals between the vertical rollers or bowls which stand with the ends upon the bottom-die, and the sides rolling against the side-die. The horizontal rollers placed in this manner, cause a rubbing friction between their ends and the side-die, and thus keep it worn smooth and level. Efficient grinding takes place between the ends of these rollers and the side-die, while the vertical rollers or bowls grind upon the bottom-die. By thus preventing the circular side-die from becoming irregular, the grinding is carried on as perfectly at all times, Mr. Taylor says, as when the die is new, and the dies may be entirely worn out without ever becoming irregular. In order to preserve the muller-shoes and keep them perfectly in place, the shoes are made in long sections with two or more fastening-lugs to each section. These sections are slotted to form channels through which the pulp works to the outside of the pan. Mr. Taylor is confident that this construction is better than making the shoes in short independent sections with a single fastening lug, which does not hold them sufficiently well in place.

Comment.

The bulk of the quicksilver product of this State now comes from north of San Francisco, instead of from south; the cessation of work at the New Almaden mine in Santa Clara county, having caused the change. For about 40 years this famous mine continued to furnish the largest proportion of the product of the United States, but the grade of ore of late years has run very low so that there was little or no profit. The mines in Napa, Sonoma and Lake counties have received more attention since the practical abandonment of work at New Almaden. Those in Trinity and Siskiyou counties and in southern Oregon are also being opened and developed and reduction works are being erected. Napa, Sonoma and Lake counties have always been large producers of quicksilver but there are many prospects in those counties which have not yet been proved mines. Ten or fifteen years ago, when quicksilver ranged very high in price, a great number of small mines were worked at a profit, but when the price fell they were closed as they could not compete with the large producers. There has been very little change in price of this product for many years, but there have been changes in other conditions. Much less quicksilver is wasted in milling operations than was formerly the case and there is proportionately less demand. This State, the only quicksilver producer in the Union, except Oregon, yields more than is consumed in the mining operations of the country, and quantities are shipped to China and elsewhere; still, there should be room for many small mines to resume operations in California, since the methods of beneficiating the ores are better understood, simplified and less expensive than in former years. The cinnabar-belt in this State is quite extensive and, while more or less prospecting has been done, careful research may result in the discovery of more important deposits. Colusa, Mendocino, Trinity, Humboldt, Siskiyou and Del Norte counties, above Napa, Sonoma and Lake, and, below the known deposits in Oregon, are all likely localities for the prospector for quicksilver. There are still opportunities in the coast range for prospectors, for, while a good deal of this work has been done in these regions, it has been done largely by men who were not practcal miners or prospectors.

For a great mine with a great record, Con. California and Virginia makes a very poor showing for its past year's work. A large quantity of ore was worked, which averaged by pulp assay $23.37 per ton; yet it did not pay. Though the company had an increase for the year of $1,084,258.40, it came out $109,000 behind. Its greatest expense was for milling the ore, for which $323,388 were paid, at $5 per ton on the 54,898 tons worked. The published pulp assays averaged $23.37, or a total of $1,282,767; yet the mills only returned $987,624, keeping in the tailings $295,143. With what they were paid, and what they thus kept, they got upward of $670,000 out of $1,282,767 worth of ore, or over one-half. This was a very good proportion for the millmen, but a very poor one indeed for the stockholders in the mine itself. In the Hale & Norcross case, experts proved that $14 rock would pay a profit on the Comstock, but here is an example of $23 rock showing a loss. Under such conditions, unless the mine shows up new and rich development of ore this yesr, assessments will probably have to be levied on this famous mine, which has paid so many dividends in times past. As it is looked upon as the leading and representative mine on the great Comstock lode, such an example bodes no good for the stock market. It is bad enough for a large group of mines to be worked continuously for years without paying dividends, but when assessments are imminent on the best of them, people are not apt to invest much in the stocks or have confidence in the properties. The Consolidated California and Virginia was originally two distinct mines, and ss the name implies, they were formed into one property. The record of the mine up to October 1st is as follows: California produced—Gold, $23,395,273.01; silver, $23,473,804 97; total, $46,869,074.98. Consolidated Virginia produced—Gold, $29,377,441.91; silver, $36,234,233.14; total, $65,611,675.05. Consolidated California and Virginia produced—Gold, $8,209,145; silver, $9,355,643.06; total, $17,564,788.09. Grand total—Gold, $60,981,856.92; silver, $69,063,681.17; total, $130,045,538.08. Dividends — California, $31,325,000; Consolidated Virginia, $42,930,000; Consolidated California and Virginia, $3,682,800; total, $77,932,800. Only about $300,000 in assessments were ever collected, and this in the early days of the mine.

The organization this week of an electric power company for the city of Sscramento is the initial step of a very important enterprise. The directors are residents of San Francisco, who have already subscribed for $600,000 worth of the $1,500,000 capital stock. They intend not only to furnish light, and build and operate an electric railroad of 16 miles in length, but to furnish electric power for manufacturing and other purposes. The original source of power is the American river, where it falls over the dam at Folsom. This dam we have already described in the PRESS. The distance from the dam to Sacramento is about 20 miles in an air line. The Sacramento Electric Light and Power Co. will, by contract with the Folsom Water Power Co, receive a large portion of the power of the latter company, and, converting it into electricity, transmit it to Sacramento. The dam is 210 feet above sea level and is therefore about 175 feet above the level of Sacramento. The basin or reservoir above the dam is upward of three miles long and has an area of 5,850,000 surface feet. The dam is fitted with a timber shutter operated by hydraulic cylinders, and which, when closed, will raise the water six feet over this area, adding to the contents of the reservoir 35,100,000 cubic feet of water. There is then created a reservoir containing a reserve of more than 13,000,000 cubic yards of water, and there is, in addition, the daily flow of the river. There is an abundance of power developed at the fall, which will be electrically distributed at Sacramento. This should be of the greatest importance to the industrial advancement of that city, which will have the advantage of any city in the State in obtaining cheap power for manufactures.

Lake is one of the counties of California which has made comparatively little progress owing to its lack of railroad facilities. Stage-coaches and freight-wagons still hold sway within its boundaries, and communication with the outside world is slow and expensive; but at last a project is under way to build a railroad from the margin of Clear Lake, at or near Lakeport, to a point on the San Francisco & North Pacific railroad. This is only a distance of 20 miles, and electric-power is talked of for the new road. A company has been formed to build it, and also to build and navigate steamers on Clear Lake to connect with the road. Lake county would receive a large amount of tourist travel could the great lake itself be readily and conveniently reached. As it is now, however, it takes too long to get there from San Francisco, and people accustomed to railroad travel dislike to go when they have to "stage it." It is stated that the Clear Lake & Russian River Railway and Navigation Company is in earnest about building the proposed road at once. The natural resources of the county have never been properly developed, owing to lack of suitable transportation facilities. It would take a railroad to induce immigration there and make the lands valuable. The sooner it is built the better.

The Proposed Union Depot.

The *Report*, *Bulletin* and *Call* of this city, and some of the interior papers, are opposing the proposition to he voted for at the coming election to allow the State Harbor Commission to issue bonds for $600,000 for the purpose of building a depot at the ferries at the foot of Market street, San Francisco. The grounds of the opposition are that the State ought not to build a depot for the railroad company and that the company should build the depot itself. As the only available land on which the depot can be built belongs to the State and cannot be sold or leased, it is not clear how the railroad company could well build there. In fact, there seems to be a misunderstanding about the matter. It is the intention to build the depot from revenues received by the State Harbor Commission, just as the seawall, wharves and other public works are built. But the annual surplus, sufficient to construct the depot, is so small that it would take eight or ten years to finish the building in the ordinary course, so that the Harbor Commission wishes to mortgage its income and put up the depot at once on the sections of seawall already completed. The legislature passed what is known as the "Depot Act," authorizing the issuance of $600,000 bonds, but this must be ratified by a vote of the people of the State. The depot will be built in any event, as it is a necessity, and the only question is whether it will be done at once, or drag along for eight or ten years. It is a question of waiting for the money to accumulate, or raising it at once through the bonds. It is represented by those opposed to the measure that the depot will be for the exclusive use of the Southern Pacific Company, and the idea is conveyed that the company will control it entirely. It is a fact that they will use the larger portion of the depot for the simple reason that they do most of the railroad and ferry business here, but it is also a fact that the Saucelito and Tiburon ferries and railroads will use the building, and all of them must pay rent to the State in proportion to the room they occupy. The two small depots already built on the belt railroad on the water-front bring an income to the Commission of $1800 a month; and the present ferry depot at Market street also brings a monthly income of $4750 from the Southern Pacific. The very general prejudice against the Southern Pacific and its methods, naturally militates against the company when the people have an opportunity to express themselves, or to act, as in this instance. At the same time it should be understood that the people are not asked to pay anything in this case more than would have to be paid under any circumstances, since the depot will be built from the Harbor Commission funds in the end and not from any direct taxation. It is only a question of building at once, or building gradually. The railroad company must pay rent to the State and will probably have to pay more in the new depot than they do now. At present the depot is entirely inadequate. It is small, crowded and inconvenient in every way. Not only the immense crowds who use the place daily on the ferry lines are incommoded, but also all who come overland or from the interior on the railroad lines. The travel of the entire State concentrates at this point and a suitable depot is a real necessity. It is unreasonable for the people to let their prejudice against the railroad company blind them in a case of this sort. No doubt the company would be glad to get the land and build the depot for themselves if they could. That is, however, impossible. That the company has undue influence with the Harbor Commission is no argument, even if true. They seem to have undue influence almost everywhere and exercise it as they please. But because of this the traveling public should not be submitted to inconvenience for years and the city be disgraced by a tumbledown depot not large enough to accommodate those who use it. This new depot is intended for passengers only, and they are the ones who will suffer if its construction is deferred. The railroad company does not seem to care very much for the comfort of its patrons, one way or another, and if the people refuse to build the depot, the company will let them get along the best way they can.

The water-front of San Francisco does not belong to the city, but to the State. When the United States gave to the State of California the marsh and overflowed lands, most of these were sold, but what constituted the water frontage of this city was retained and still continues to be State property. The revenues derived from wharves, tolls, etc., all go to the State; but of course the State, through its Harbor Commission, must build and maintain the wharves and depots. The revenue is used for building seawall, wharves, for dredging, etc. It is a mistaken idea that the railroad companies or ferry lines use the wharves and slips free. They must all pay for the accommodation. The Southern Pacific, for instance pays $700 a month for each of the five slips used by the ferry boats, and $1250 per month for use of the present depot building at the foot of Market street. This makes $4750 per month.

With what the Harbor Commissioners get from the railroad company as rent, and from fruit stands, express company, post office, advertising, etc., they obtain a total monthly rent of $2185 for the little depot they now have; and in addition get $3500 a month, as stated, for the ferry slips. The railroad company is only one of the tenants. The Southern Pacific also pays $900 a month for the Lombard Street slip and depot on the belt railroad, $1600 a month for the Second Street wharf, and $800 for switching cars on the belt railroad. So, for all the slips, depot and belt road, they have to pay $8050 per month. In addition the average payment to the Harbor Commission for tolls collected is about $4500. So altogether, the Southern Pacific pays the State for accommodation on the water-front of San Francisco over $150,000 a year, a sum far beyond what most people imagined.

These figures are given simply in order that those not familiar with the matter may have a clear understanding of the fact that whatever accommodation the railroad companies get on the water-front of this city they have to pay for. It is the same with the Saucelito and Tiburon ferries and railroads, which pay proportionate rates for what they require. The building of the depot entails no increase in taxes. The roads cannot buy or lease this State property, and there is no place on the water-front not belonging to the State. No one railroad company can control the proposed depot for all roads have a right to demand landing and depot facilities, and must pay for them. Every individual or company is simply a tenant of the State. In other places the companies build their own depots, but the circumstances are such that they cannot here, if they want to do so. A union depot at the foot of Market street is an urgent necessity for the accommodation of the traveling public, and it will be a great mistake to vote down the proposition to build one, now before the people.

Coast Industrial Notes.

AN artificial stone manufactory will be started at Los Angeles.

NAPA is to have the railroad depot lighted by electricity from a tall mast.

SACRAMENTO CITY is spending between $20,000 and $25,000 this year in strengthening and raising its levees.

MARICOPA county, A. T., will spend this year not less than $50,000 for building and furnishing new school-buildings.

A TELEGRAM announces the shipment of about $60,000 in gold from the Alaska Treadwell Mine of Douglas Island. It will come by the next steamer.

AT a special meeting of the Board of Supervisors of Marin county, M. G. Elmore and C. B. Greene of San Francisco were granted a franchise to erect an electric-light plant at Saucelito.

THE Mount Diablo Mining Company's mill at Sodaville has been shut down for the purpose of making some alterations and a general cleanup. It will require about two weeks' time to make the changes.

THE Standard Con. Mining Company of Bodie is pushing the work of constructing its electric-power plant and it is the calculation to have it in working order by the 1st of December. The poles are all set and the wire on the ground.

CHARLES BEAN, Mrs. Jessie G. Olin and Henry Hart, property-owners on the Mabury road, have filed a notice of intention to form an irrigating ditch company to conduct waters from the Penetencia creek, Santa Clara county, southerly to Mabury road, where they will be divided and distributed along the line of the signers' property.

OWING to the large number of men on the employment books and such a limited amount of work to be done at Mare Island Navy Yard, only veterans are now enrolled unless in some particular case. Veterans may have their names placed on the books at any time, and they are to have the preference over all others in employment.

A SPECIAL train of 20 cars of walnuts has been shipped from Los Angeles. Nearly 20,000 pounds of walnuts were placed in each car, and the estimated value of each carload is about $2000. This is the first train of this character which has been shipped across the continent, and the occasion is an interesting one to shippers of California products. The nuts are the products of the Los Nietos orchards.

THE buildings for the new meat-packing establishment at Rodeo are ready for the machinery, which will be placed by December. The big reservoir, which has a capacity of one billion, one hundred million gallons of water, is also constructed and being filled with mountain water. The packing houses and town of Rodeo will be supplied from this source.

REAL estate throughout the country is suffering from the customary bad influence of a national election. Probably no branch of trade is affected more by politics than the real estate market. The fact that business in this line has been uncommonly dull in San Francisco this fall should give nobody cause for alarm. It may safely be said that as soon as the returns are all in, the market will resume its customary activity.

A RECENT Fresno dispatch reads: "A report from a majority of the vineyards says that the raisins are drying very well in spite of clouds and threatened rain. In some vineyards the precaution has been taken once or twice to stack the trays on account of the lowering condition of the heavens, but in each case it proved an unnecessary precaution. The raisins are rather surpassing expectations. They are not only of a quality better than had been expected, but in most vineyards the yield is above the calculations earlier in the season. The shipping of large quantities of the second crop north for brandy will furnish a profitable way to dispose of that product and at the same time will tend to lessen the total output of the raisin industry of this county, thereby helping to strengthen prices.

THE Chino sugar factory closed its second season's run October 29th, having been in operation since July 1st. Nearly 28,000 tons of beets were worked up, for which the factory paid the farmers $112,000. The total output of crude sugar is 7,903,541 pounds, on which the government bounty is nearly $150,000, making about 200 carloads of sugar. Over 500 hands have been employed in the factory and beetfields, and $150,000 were paid in wages.

THE Pacific Grove Electric-Light and Power Company was incorporated this week. The company which is composed of San Francisco and Monterey capitalists propose to equip a complete system of electrical illumination for Pacific Grove and in addition to electric-lighting will furnish power for propelling an electric street railway, which is to run between Pacific Grove and Monterey. It is the intention of the projectors to push these enterprises to an early completion.

THE Redlands Electric Light and Power Company has secured A. W. Decker, late with the San Antonio Company, as supervising engineer, and he will have complete plans ready in two weeks. W. C. Butler has charge of the civil engineering, and has his plans perfected. R. J. Kennedy has been awarded the contract for 158 feet of tunnel. Contracts will soon be let, and by July 1st next, at the latest, light and power will be supplied. The company now has $20,000 in cash on hand.

THE directors of the San Francisco and Santa Clara Valley Railroad Company have ratified a bonded indebtedness on their proposed railway covering the cost of construction of the line. One of the gentlemen interested said that the bonds had been placed covering the cost of building the first section of twenty-five miles, and the balance of the bonds would be accepted as soon as the first section was completed. Construction work will soon commence from a point on the bay near Mayfield.

SAYS the Dunsmuir News: Mr. Wheeler is putting up a sawmill for the Red Cross Company on Soda Creek which will be, when completed, the largest mill in this part of the State. It is 206 feet long by 40 feet wide, two stories high. Besides the big circularsaw there will be a bandsaw, cut-off saws, etc. The mill will have a capacity of 100,000 feet a day, and will cut timbers 60 feet long. The lower floor will be used as a shinglemill with a boxfactory and fine cut connected.

ALL the cribwork on the Oakdale dam is now done, and it is a solid-looking structure. A new tramway has been built across the river just below the dam, and large, heavy rocks are now being dumped in. The work of strengthening the dam below will be completed before any attention is directed to the upper side. The water now flows through the cribs. The work of tightening will be accomplished with straw, brush and rocks. The superintendents propose to devote two week's time yet on the work, although the dam will be ready for its purpose before that time.

THE engineers of the San Francisco and Great Salt Lake have completed their surveys to the State line. It is said that satisfactory grades have been established on the Sierras and also over the Alameda county hills. The profile work remains to be done and then the cross-sectioning preparatory to actual grading will be undertaken. It is now known that the 200 acres of land on the Contra Costa shore purchased in September last and transferred by Thomas B. Bishop to E. L. G. Steele are intended for the terminal facilities of the new road on the east side of the bay.

PLANS are being prepared at Washington for a 40-ton locomotive traveling crane for the Mare Island Navy Yard similar to the one just completed in the East for the New York yard. It is to be operated on a track extending around the sides and head of the stone drydock and will convey armor plates such as are now used weighing many tons, to any place desired. It will cost about $40,000 and will be the largest traveling crane on the coast. A smaller crane, capable of lifting 12 tons, is to be erected on the wharf just south of the entrance to the drydock.

FOR years past, there has been talk of building a reduction works at Los Angeles. At last, however, work has been begun to clear the ground for a plant, and all the necessary machinery is reported to be contracted for. The works are to have capacity for working 200 tons of ore per day. Thousands of tons of ore are in Inyo county, within 200 miles of the new works, but cannot be sent there until the gap of a little over 100 miles of railroad shall be closed between the mines and Mojave. In the meantime, all the ore of Inyo is hauled over two ranges of mountains and 600 miles to San Francisco.

M. P. PALMER, who is engaged in the building of the San Joaquin water ditch, reports rapid progress in that grand enterprise. He says that he has eighteen men at work, and has already completed about two miles and a quarter of the work, leaving a mile and three-quarters yet to complete, which will be accomplished in about five weeks. The ditch has a carrying capacity of 5000 inches, which it is calculated will irrigate about 3000 acres. Next year Mr. Irvine proposes to build a dam in Santiago canyon that will contain a large body of water—about a mile and a half long by half a mile wide.

THE contract for the construction work on the S. P. railroad between Santa Margarita and San Luis Obispo has been let to Geo. Stone & Co. of San Francisco for $1,500,000. This includes some 8000 feet of tunneling, and it is estimated it will require 15 months to complete the contract. The rest of the gap from San Luis to Ellwood will be comparatively easy work, and nothing will be done on this part until the tunnels are almost completed. The largest tunnel is at the summit of the Santa Lucia range and is 3700 feet long. Seventy-pound steel rails will be used in the construction of this road, and when completed it is to be used as the great overland tourist route of the Southern Pacific. Camps have been established and work actually commenced at all the tunnels. As large a force as can be conveniently managed will be kept constantly at work until the road is completed.

MILL CREEK, in Visalia, is used by many as a sewage outlet, and a thorough and frequent flushing became necessary. Mr. C. S. Richardson, of Visalia, has devised a method of flushing which he recently put into practice. The plan used by Mr. Richardson is this: On the bank of the creek in the eastern part of the city he bored a 7-inch well 44 feet deep. The water in the well rises to within three feet of the surface. The well is cased and the pumping is done by a two-horse gasoline engine using a 2½-inch centrifugal pump. A dam is placed in Mill creek 90 yards below the pump and another above the pump. Between these two dams are collected 125,000 gallons of water, which required about ten hours easy pumping. This body of water was turned loose, and sweeping down the channel of the creek carried off the stagnant waters and impurities. Those who watched the process think it a success. Mr. Woodin, of Woodin & Little, the pump-dealers of San Francisco, was present and was pleased with the plan. The creek will be flushed twice a week for the present.

THE latest plan of the Spring Valley Water Company in the storage of vast supplies of water which in future will be necessary for the requirements of this city and vicinity is to construct an enormous reservoir on Calaveras creek, about ten miles from the bay. At that point there is a large depression in the hills, which, by the construction of a dam about as large as the one at San Mateo, will enable the company to impound a quantity of water equal to the amount which can be impounded in the San Mateo reservoir, or 29,000,000,000 gallons. This is sufficient to supply this city for 900 days, calculated on the present consumption. The company has already acquired thousands of acres on Calaveras creek, or enough to give them an uncontaminated watersbed. The water from the Calaveras lake will be brought to this city around the lower end of the bay by a pipe line. With the San Mateo and Calaveras lakes, and from its other sources, the Spring Valley Company estimates that it will have a supply of water large enough for a city the size of New York, and be beyond all danger of a water famine.

Personal.

L. W. COLBATH has gone with S. L. Powell, to examine the mines at Monkey Wrench, Nev.

DURING the absence of T. G. Barlow-Massicks in England, H. A. Swan will attend to the business of the Lynx Creek Hydraulic Company, Arizona.

THE Quartz Mountain mill, Amador City, has started up. Mr. Kyle of San Francisco is in charge of the mill and John Palmer is general superintendent.

H. H. WARNER, the great patent medicine man and principal owner in the Seven Stars mining group, near Prescott, is in Arizona looking after his mining interests.

THE Parr mining location, Nevada Co., has been bonded to the Brockington Brothers and W. J. Connors, original workers of the W. Y. O. D., and they will put the Parr in proper shape.

A. C. HAMILTON, superintendent of the Chollar, Potosi, Bullion, Exchequer, Alpha Consolidated, Consolidated New York and other Comstock mines, has been in the city this week.

JAMES MCKENNA, W. H. Crase and W. J. Rogers own the South Idaho mine, Grass Valley. This used to be the A. B. C. mine, and has been consolidated with the O. K. The mine is being prospected.

OTTO VON GELDERN, a civil engineer in the employ of the Government engineers engaged in river improvement in this State, is in Sutter county making an examination of the channels of the Feather river.

W. G. WHORF, of Sutter Creek, Amador county, was in the city last week, and is going East to place certain mining properties. The mines of Amador have generallly made good records for themselves, that and Nevada being the "banner" gold-producing counties of the State. There are still many good claims in Amador which only need capital to become valuable properties.

W. H. FURMAN and Mr. Davidson have resigned from their positions on the Cedros Island Mining Co., and C. B. Richards, L. S. McLure and H. Ingle have been added to the list of stockholders. Judge Ingle has been elected president, and Mr. McLure general manager. The company has been reorganized, more capital put in, and the mines on the island will be worked more carefully in the future.

CRUISER No. 6, to be known as the Olympia, is to be launched from the shipyard of the Union Iron Works, Saturday, Nov. 5th. The vessel is 354 feet long and 34 feet wide. She is larger than either the San Francisco or Charleston, being of 5700 tons register. There is yet a year's work to do on the ship after her launch, putting in the engines, boilers, fittings, etc. Many invitations have been sent out, and an immense crowd is expected to witness the launch.

THE Department of Civil Engineering and Astronomy of the University of California announces an "extension course" and organized a class in general astronomy at the Chabot Observatory, Oakland, this week. The course is not limited to university students, so that any one desiring to join the class may communicate with Armin O. Leuschner, Berkeley.

Mines and Mining in Nevada County.

By Our Traveliog Correspondent.

Part III.

GRASS VALLEY, Oct. 10, 1892.

TO THE EDITOR:—Mining men generally report that the present season has been an unusually good one for the mines in here; that there has been far more activity than in several years previous, and the probabilities are favorable for its continuance, and an augmenting of new enterprises.

About Grass Valley these new operations are more numerous and noticeable. They have not all started within the past year, but it is during this time that they have begun to assume the pretentions of a mine. The older operating mines have run on steadily, very much as they have in years past.

THE IDAHO.—It is customary in the other mines to speak of the levels as run every hundred feet on the incline, which gives a much less vertical depth. From the statements of Mr. Ed. Coleman it is to be believed that the lower levels are not showing as it was hoped they would. As the mine is worked out above the 1800-foot level, if a new and lower chute is not struck in some of these deeper workings, it may not be long before we hear of the great bullion producer closing down. The expense of keeping this mine open is tremendous, owing to the heavy and continued timbering throughout its great depth and length, and by a mine less rich could not be borne. But at this late day it is considered impracticable to sink a new shaft, hy which the ore might be hoisted direct to the surface. Now it is necessary to run the ore out 1000 or 1500 feet to the bottom of the lower incline; there it is lifted 2000 feet to the 1000 level by the underground hoist; thence, 400 feet by a tunnel to the upper shaft, and finally hoisted to the surface, 1200 feet more.

The Idaho Company has been anxious to secure the adjoining Maryland ground, and the Maryland, represented by Mr. S. P. Dorsey, also an owner in the Idaho, is desirous of the Idaho works to develop its own property. But each seems to ask more than the other cares to pay.

THE MARYLAND is an extension of the Idaho, as the Idaho was of the old Eureka. This is proven beyond a doubt, as the Idaho, in its richest portion, on the 1600-foot level, worked to the Maryland boundary and gouged a short distance beyond, which at the time caused some legal complications, readily settled, however.

The Maryland has hoisting works and a shaft 350 feet deep. Nothing is doing, and no prospects of activity for some time to come.

THE EMPIRE MINE.—This is the oldest working mine in the State, and under the superintendence of Mr. G. W. Starr, has developed into one of the higgest and best. The present outlook is said to be better than it has been at any time during the past five years. During the past six months the 2000-foot level has been opened up. A north and south drift is here run ahout 400 feet. At this point the ledge flattened to less than 30° which necessitated a crosscut from the shaft a distance of 300 feet. It is expected that the ledge will shortly dip again and run into the shaft.

During the late Admission day celehration in Grass Valley, Mr. Starr gave a public reception at the mine. Each guest was presented with a handsome souvenir of ore from the 2000-foot level, commemorative of the mine and the occasion.

The rock at this depth is high grade, carrying as much as $30 in free-milling and $150 in sulphurets. Stoping is going on in the 1800 and 600 levels. In the latter a fine chute has lately been opened up, running as high as $40 a ton in free-milling. The mill is 40 stamps. Sixteen Triumph concentrators are in use. The sulphurets are sold to the highest hidder.

W. Y. O. D.—The mine is owned by Weissbein Bros. Bankers, Grass Valley. Mr. D. N. Coflin is superintendent. This property is pointed to as an example of the mining possibilities of the district. A year ago it was only a "prospect" like dozens of others; capital, however, and intelligent enterprise took hold of it and to-day it is one of the "big mines." Its success, of course, has encouraged others; and give most any of them the opportunity and the result would be similar.

The mine is a short distance west of the Empire, on a parallel ledge. It has a 10-stamp steam mill, completed a year ago; also four Frue concentators. It is developed hy an incline 950 feet, and north and south drifts on various levels a distance of 300 feet. Stoping is going on in all at the same time the shaft is sinking.

The other mines of this group are in the prospect stage of the W. Y. O. D. of a year ago.

THE LAUREL, or known as the Golden Treasure is the south extension. Frank Dulmaine is superintending it in the interests of an eastern company which has leased it. It has a small steam-hoisting plant and is sinking to strike the ledge with a vertical shaft down nearly 200 feet. It has started within the past three months.

THE PENNSYLVANIA, adjoins the W. Y. O. D. on north. It has a small hoisting plant and five-stamp mill, with one six-foot Woodbury concentrator. Mr. John Eddy is superintendent. The shaft is down 600 feet and sinking. The lead is said to be improving.

THE TELEGRAPH, east of the Pennsylvania with a small hoisting plant, is another promising and deserving property developing slowly for want of capital.

THE OMAHA.—The 28-stamp mill is kept continuously husy on ore said to average $30 free-milling. The sulphurets are saved on eight Frue concentrators and sold to custom. Owing to lack of room for more machines the corrugated belt is used, doing nearly double the work of the smooth belt, though not as thoroughly in regard to the cleanness of the product.

The mine is now opening on the 1500 level. The last year has opened the 13th and 14th levels, and at present stoping is going on in the 11th, 12th and 13th.

The ledge extends north and south, with a pitch of about 30° to the west. Like many of the mines in this district, part of the ledge, the southern extremity, seems to lie in syenite or granite, and the northern portion in slate; though generally with depth, they pass beyond the syenite, except alone in the Allison Ranch group, and enter the slate again. In the Omaha the ore chute pitches southerly into the syenite. It is in the south drifts that the best pay has been found. Mr. Geo. Maynhard is superintendent.

THE HARTERY is a continuation of the Omaha on the south, lying between the latter and the Allison Ranch. Mr. Geo. Maynhard is superintendent. It has no mill but has a small hoisting plant. The incline is down 400 feet and is still sinking. The ledge is small but hopeful. The ore is being stored on the dump and at present is to be crushed by custom.

THE ALLISON RANCH, a very rich property lying to the south, has been idle for some years. It is owned by Mr. Davis of San Francisco, who has refused many large offers by men who wish to develop the property further. The mine was last worked by "tribute," but the "tributers" striking it too rich of a sudden, the pumps were removed and the mine flooded. It is stated that Mr. Davis himself intends reopening the mine next season.

THE WYOMING.—This is another of the "present season" mines. It has a small, 15-h. p. hoisting plant. Mr. B. F. Runnels is superintendent and part owner. The mine is on the south edge of town and started out as a "back-yard" prospect, but it has already, within 200 feet, shown evidences of becoming a good mine. Bunches of rich ore have been frequently met from the surface, and at 165 feet, in an 18-inch ledge, they have come upon what seems a large and continuous body of high-grade rock. The ledge is a north and south one dipping west, supposably on good evidence an extension of the famous Dromedary of early days.

THE CENTENNIAL.—The Centennial is chief among the Osborn Hill group. It is on the Empire lead, one mile south. Mr. A. W. Stoddart is superintendent and principal owner. As yet there is no mill on the property, though the company is looking toward the erection of a 10-stamp mill within a short time. It has a steam-hoisting plant, the building being built to receive the batteries at any time. The present management assumed control a year ago. The shaft is 650 feet deep, with five levels, the longest of 850 feet. The ledge is from one to four feet in thickness, and the rock has averaged as high as $100 per ton.

In this same locality are other good mines waiting for capital, as the Orleans, Daisy Hill, Sebastopol, Green Mountain, Lafayette, etc.

THE PEABODY mine of Alf. Tregidgo is idle at present, awaiting the introduction of electric power. This mine, lying to the west of town, is immensely rich, and as soon as it has an adequate plant it will be thoroughly opened up. The shaft is down 400 feet. The serious drawback in working the mine has been the vast quantity of water met with. To handle this it has been necessary to put in two large pumps, one 12-inch and one 8-inch. Mr. Tregidgo is also operating the Hudson Bay, a prospect with small hoisting works, and previously a good mine.

The famous Gold Hill mine, lying just to the west, is also idle and full of water, awaiting the advent of electricity. Splendid new hoisting works and new pumps have been put in, preparatory thereto and in anticipation thereof.

THE NORTH STAR.—This is the biggest and deepest mine, aside from the Idaho, in the county. It is 60 feet below the 2300 level and sinking for the 2400 level. It is fully opened to 2200 feet, the lowest stope. The main work is all helow 1800, and in the west drifts. The ledge at the lowest point continues strong. The mill is of 40 stamps, 16 concentrators—12 Triumphs and four Frues—and the best equipped mill in the district. Mr. E. R. Abadie is superintendent.

CENTRAL NORTH STAR.—East and adjoining the North Star is the Central North Star, and supposably an extension. The North Star ledge differs from others of the locality, as the Omaha, in that it is a cross or east and west ledge, dipping northward. The formation is of slate.

Mr. James Bennalack is superintendent of the Central. The mine is still a prospect one, with steam hoisting works. The shaft is vertical, and to a depth of 250 feet. At 150 feet a crosscut was run 120 feet to the ledge, showing good milling rock. With greater depth the shaft will cut the ledge, when still better results are expected. The shaft was sunk thus in order to fiind the ledge, as no surface croppings showed.

The St. Johns and Evening Star, both without mills, are reheginning active operations.

THE HERMOSA, another young and hudding property, is owned by Dave Mauvick and other Grass Valley capitalists. It has been slowly developing for the past two years. There is a steam hoist, and a shaft 500 feet deep on the ledge. At this level a north and south crosscut has heen running, and within the past couple of weeks a good body of ore is reported to have been found.

THE MERRIMAC.—This is on the extreme east houndary of the Grass Valley district, 2½ miles from town. The ledge is in slate, strikes east and west and dips to the north. In fact there are three ledges, two parallel and one cross ledge. The mine was worked as early as 1851 and proved rich, even with the then crude methods. Within the last year Mr. C. E. Clinch and a company have taken it to open in permanent form. It has a good, suhstantial steam hoisting plant and will doubtless have a mill hefore another year has passed. The shaft is down 550 feet, in ground heretofore unworked. Good crushing rock is now being extracted and milled at custom. The ledge at the bottom runs about 15 inches in width. A crosscut is heing run at 500 feet. This company is also contemplating the introduction of electric power. Mr. Chas. Stocks is superintendent.

THE COE mine has lain idle for a year. San Francisco parties had it honded, but owing to a disagreement of management the hond was released. The owners are now considering a plan for the resumption of operations. It has a hoisting plant and a 500-foot shaft, but no mill. It is considered a good paying mine.

There may have been more space given to the small properties than their present importance would seem to justify, hut it is on these mines that the future of the section depends. The large producers are limited in number as well as to length of life, and all that is wanted to make any of these lesser propositions great is money and time—principally money. For this, there is a crying need. This is all the more strange, too, for with quartz enterprises here success may be said to be uniform. There have been failures, trnly, but they have been most invariably the result of mismanagement or lack of funds, for under proper direction they have proven the greatest successes. Of course there must have been the first assurance of a ledge. But even this result of past experience seems insufficient to overcome the diffidence of capital to investing in a ledge that averages 18 inches and seldom exceeds two feet in thickness. Men of means and mining proclivities look for a Colorado silver lead in a Grass Valley gold lead.

CHAS. E. TOWNSEND.

A Private Letter and a Public Answer.

SAN FRANCISCO, Oct. 31, 1892.

TO THE EDITOR.—I have received a letter, which will, I think, amuse such of your readers as may honor with their approval, or the reverse, my efforts to promote the consumption of printers' ink. To save you the trouble of deciphering the "hieroglyphics" of my correspondent I transcribe as follows:

C. H. AARON, Esq.—I have just read your article io the MINING AND SCIENTIFIC PRESS of September 3d, criticizing tbe chemical views of M. T.; would you please write another article and tell us what it is all about? Anybody could sit dowo and io three months read up enough chemistry to understand tbe symbols aod oomenclature used, but the most of us baven't done so, and doo't intend to. It is always bad taste to talk shop io general compaoy, it is more, it is affectation aod traosparent cooceit. Some of us can get along io Latin, Greek, Freoch and Italiao, but we doo't give an order io a restaurant in aoy of these languages to a waiter that only knows Eoglish. Hence, for tbe same reason I am not writiog to you io Latin. Always remember that tbere is oothing in tbis world that tbe next man can't understand if it is properly explaioed, and the day is past wbeo people stood in awe of a danciog dervish decked in gowo covered witb bieroglyphics. We cao all be made to comprehend why cyaoide dissolves gold in some cases aod does not io others without torturing the alphabet till we bave it squirming and wriggling about in a newspaper columo as if it had an epileptic fit. Respectfully,

JAMES SMITH.

If James had written his usual neat and legible hand, also giving his real name and address, we might have arranged matters by private correspondence; as it is I wish to reply:

DEAR JIM—I am sorry you don't like symbols. Chemists like tbem, so do I, though hardly a "professiooal cbemist." I thiok you will cbange your mind on further coosideratioo. Symbols simplify cbemistry aod tbey are so ecooomical; for example, which would you prefer in yours: Monomethyldiethylisohutylammoniumindide, or just plaio, $C_9H_{22}NI$? With all *due* respect,

C. H. AARON.

Deep Coal Seams.

It is commonly known that the disposition of the coal seams upon the Continent necessitates the carrying on of mining operations at very considerable depths. In Belgium, and in the center of France particularly, the thin upper seams are being fast worked out, and it is found necessary to go deeper, with the result that richer deposits are being discovered. At the same time the difficulties of mining are greatly increased, and this is strikingly evident at Flenu-les-Mons in Belgium, where a depth of from 110 metres to 1150 metres is heing attained. In sinking at this depth an enormous "come" of water was experienced, together with formidable blows of gas. The water had a temperature of 50 degrees centigrade. Attempts were made to stem hack this water and gas by the construction of a dam of masonry 2 metres 70 in thickness, hut even this powerful check availed nothing against the force of the water and gas, and it will be found necessary to collect the water in a "sump" and pump it to the surface. In the meantime, these formidable foes to miniog are in constant turmoil and create a noise like continuous thunder. Notwithstanding the seriousness of these difficulties, the proprietors are resolved to overcome them and machinery of a very powerful type has been laid down, of which the pistons have a diameter of 1 m. 25 cm. It will also be necessary to replace wood with iron for supports and other purposes in the lower workings. If the attempts to win the coal in the lower depths of this mine are successful, encouragement will he given to the working of the Rive de Giers deposits which underlie those at St. Etienne.—London Mining Journal.

THE AUSTIN DAM.—The *Scientific American* of September 24th, in connection with an interesting article under the ahove caption, prints on its front cover page three illustrations of the famous Austin Dam, now being huilt across the Colorado river at Austin, the capital of the State of Texas, which is to furnish the city with water works and electric light and its manufacturing enterprises with cheap water power. This dam is notable in that the volume of water which will pass over it is estimated at 250,000 cubic feet per second, which is nearly equal to the volume at Niagara falls, to wit: 275,000 cubic feet per second; hence the great interest attached to its construction. A promineut feature of the lllustrations is the Lidgerwood cahleway, which is shown as used in the building of the dam. This cableway, which is the invention and was erected by the Lidgerwood Manufacturing Company, 96 Liherty street, New York, is the longest hoisting and conveying apparatus in the world. It is 1350 feet span and has a capacity for handling 6½ tons of stone at a speed of 600 to 800 feet per minute, hoisting and conveying and delivering the loads anywhere along the top of the dam, as may he required.

Surplus Horses.

Almost every farmer has his pasture overstocked with unsalable horses that are eating their heads off. Still we keep right on in the same old rut, hoping that the market will be better next year, and reading of the great prices that Stanford, Haggin, Winters and others have received.

The truth is that for the past 20 years production has been out of all proportion to demaud. From 1870 to 1880 the census shows an increase of population of 29 per cent and an increase of horses of 44.95 per cent. During the last decade population increased 22.6 per cent and horses 44.59 per cent. In California the last decade showed an increase of population of 39.7 per cent and of horses a gain of 46 per cent.

In the moantime, extension of railroads has displaced many stages and freight teams; cable and electric power have almost superceded horse cars and made great inroads on livery trade; steam has invaded logging camps and grain fields and settlement is gradually reducing the range territory and the demand for vacquero horses.

On the other hand, the change that is taking place in irrigated sections from extensive to intensive farming requires not less than four times the horses, and the phenomenal records that our trotters and runners have made demonstrate the advantage of a climate where the colt's growth is never checked nor his exercise interrupted, and auction sales in the East of undeveloped colts of approved breeding have been very encouraging. These data explain the apparently contradictory remarks that "There is no sale for horses," aud again, "A good horse will always bring a price."

The truth is, different classes of horses and less numbers are demanded, and as the times have changed we have not changed with them. On freight wagon, stage coach or horse car it did not make so very much difference about the style, disposition or breeding, so long as animals were tough and sound. Vacqueros consider that horse a poor, lifeless stick unless he does responsible bucking when mounted. For these purposes the original mustang stock of California filled the bill.

Now that their vocation is passing away, these horses still keep on increasing. All along the eastern slope of the Sierra Nevada mountains great herds of horses run upon the sagebrush range almost without cost to their owners. Some of them grow gray without ever having been bridled, while others are driven home every winter to be fed and handled. Some of them are the original thoroughbred mustang with bucking attachment, others the degenerate offspring of American stock and still others are grades from imported draft or running horses. Owners reason that it will pay them to raise horses at $25 each. Some of the bands have grown to be wilder than deer or coyotes. By cunniog stratagem or tedious pursuit they sometimes manage to corral a part of them and select some worth driving to market.

Some have been sold at auction in the mountains during the past summer at prices ranging from $2 50 to $10. Others have been driven to the valleys and sold for whatever they will bring, which generally leaves the drover poorer than when he started. During the State Fair at Sacramento, 20 of extra quality that had been worked one season, brought from $10 to $20 each.

Some of these horses finally become gentle and serviceable, while others never get to be so safe, but that the risk one takes every time he hitches him up is more than the use of the horse is worth. Whenever a man buys one of this class of horses for other uses than those named above, he must feel that he is buying a small chance in a lottery. The money that he brings is not enough to make good the loss to the horse-market from this class of overproduction and the feed that he eats would have raised a good steer or six or eight sheep. Often the men who corralled them had to take the pay for their trouble principally in the fun attending the risk of their necks, and the dealer took his profit in horse-trading experience.

If there could be some concerted action for a general rodeo of these range horses and an agreement to slaughter for hides and soap-grease all animals not likely to weigh more than 800 pounds at three years of age in fair condition and also every one with a serious fault in form or disposition the balance would be worth more than the whole and slaughtered horses might be made to net two or three dollars each. Then geld grade stallions; there are too many any way and it is very late in the day to expect a profit from raising, inferior horses.

Present demands are for general purpose, heavy draft, coach, trotting and running horses about in the order named. The ten-acre fruitfarmer wants a horse large enough to draw a 10-inch plow to a good depth in orchard ground; one that is good to cultivate the raspberries or strawberries; that mother or the children can drive to town; that will stand quiet on the truck while he is gathering up his load of fruit and that will step off proudly on Sunday when the family is in the Surrey riding to church.

By crossing upon the deavy draft mares something with style and action we will often get a horse answering these requirements, also, but less frequently, by crossing draft stallions upon mares descending from trotting or running stock. There are large numbers from which this class of horses can be bred by giving proper care to keep the colts gentle and making intelligence and docility essential points in the sire. Two men out of three who want to buy horses are best suited with one bearing about this description.

For trucks, drays, busses, logging-teams, fire-engines, etc., very heavy horses are demaoded, but our importers of Percherons, Clydesdales and shires have been so enterprising that it seems likely to be more profitable to use a part of this stock for breeding a more active general-purpose horse, in view of a prospective oversupply of draft stock.

If you wanted a carriage team worth $1000, that would attract all eyes as you drove through the avenue or park, where would you go to buy them? Visit the State Fair, and among the 800 on its grounds you would have found very few.

Cleveland Bays and French and German Coach are just coming in to fill this demand. Their grades will be likely to meet a large demand as general-purpose horses, and the finer individuals among the thoroughbreds to bring more money than any others, save those whose speed has been proven or such as go upon sale with a popular pedigree. It is hard for one to name any who have made a financial success for a term of years from trotting or running stock, except large breeders of high reputation, who make one of those classes the leading features of their business.

In applauding the few who reach the top of the ladder with their worldbeaters, we forget the many who have fallen by the wayside. As we crown Nancy Hanks, Suuol and Maud S. are retired with Sullivan, the once great, to comparative oblivion. Our columns are not supposed to address a constituency of sporting men, and we know of no way for the farmer or average horsebreeder to grow rich from fast stock, otherwise than by using them as a foundation for developing from coarser strains the good general purpose horse, for which there is so much demand.

Briefly, then, weed out the scrubs. Breed up the best. Use only the better sires. Raise a larger share of general-purpose and draft horses. Put your big money into coach horses. Let the professional horsemen produce the trotters and runners at their breeding-farms, and go to them for top-crosses to produce general-purpose horses.

Ramie Machines in New Orleans

WASHINGTON, Oct. 19.—The board of experts of the department of agriculture, who conducted the experimental tests of ramie machines last month in New Orleans, have made a report which is made public to-day by the department. The trial was for the purpose of ascertaining the capacity of American machines for continuous operation for a day of ten hours, instead of the usual tests of a few minutes. Only three machines were entered for the tests—the "Kauffman," the "J. J. Green" and the "Fremercy."

Owing to delays in transportation, the ramie stalks supplied by contract from the plantation of Colonel Gustave A. Breux in Lafayette were spoiled in transit, and the stalks used were obtained from Captain Willett near Algiers and from the government experiment station.

The experts report in detail what was done by each machine before clogging. Both green-stripped ramie stalks and freshly-cut jute stalks with leaves were tried. The experiments were soon abandoned on account of defects of the machines, and the board of experts decided not to estimate the run of any machine for a day of ten hours based upon these trials, believing the figures would be misleading.

Commenting upon the tests, Special Agent Dodge says: "While the figures for a day's work, based on the results of short running, are wholly misleading, it is interesting to note that the output of the Kauffman machine, during the 42 minutes of continuous work before it clogged, represents 4743 pounds of green stalks in ten hours of continuous action, or a little over two tons; with an output of 1257 pounds of wet ribbons, equal to about 420 pounds of dry ribbons, which weight would be considerably reduced after the loose hurds and woody matter remaining in the ribbons produced by this machine had been eliminated. In like manner, had the J. J. Green machine to run continuously for ten hours, turning out ribbons at the rate of speed shown when in actual operation (that is, deducting the 67 minutes spent in cleaning and readjustment), the output would have shown a capacity of 4821 pounds of stalks and 1232 pounds of wet ribbons, equal to about 410 pounds of dry ribbons. But both machines were unable to finish the 5000 pounds of stalks weighed out to each for the trial.

"The results of the New Orleans trials are satisfactory as far as they have demonstrated the status of the machines entered and established an American record that gives a starting point for future comparison, as the results of other trials are made known. One point demonstrated beyond all doubt at the recent trials is the perishable nature of green ramie, either stripped of its leaves or unstripped, and the experience recorded emphasizes the importance of taking the machine into the field where decortication of the green stalks is carried on. Two or three small bundles of ramie stalks, with leaves cut and tied upon on the Willet plantation before noon of the 29th, had begun to show signs of heating on the morning of the 30th, though the stripped stalks and the remainder of the unstripped stalks were in perfect condition.

"It is an interesting point for future experiment to determine whether ramie stalks can be perfectly dried in this condition for machine working in Louisiana, owing to the greater humidity of this section, compared with other sections of the country suitable to ramie culture. It would seem, from my observations in Louisiana, that slight kiln drying will be necessary, after at least ten days of sun drying in the field, in order that the stalks may be made sufficiently brittle for the machine to separate the woody matter readily, and the question of profitable cultivation is another problem which can be settled only by careful examination on a large scale."

THE LAST THING TO BURN.—He was a simple countryman, but as persistent as he was unsophisticated, and when he once formed an idea or a resolution it stuck to him like wax. He got an impression, how, it does not matter, that some dark, rubbly stuff on his selection was coal, and with all sorts of visions of wealth before his eyes he sailed down to a friend in the Mines Department and worried him for days and days to get an expert opinion on his chunks of rock. The official thought to put him off and wear him down by temporizing, hut the bucolic was not to be put off, and at last the mines man got the stuff reported upon. The verdict was unfavorable, and so exasperated was the Government official at the trouble he had been put to for nothing that his annoyance smothered the sympathy he should have naturally felt for the country friend whose fond hopes were blasted. He readied himself up for a final visit from the owner of the samples, and in announcing the result of the tests to which they had been subjected, delivered himself somewhat as follows: "You believe that at the last day the world will be consumed with fire?" "Yes," answered the amazed and expectant countryman. "Well, then," continued the official, "you just go home and tell your friends that you can make yourself all right against the last day, for the stuff on your property will be about the last thing on God's earth to burn."—Australian Mining Standard.

Deep Gold-Mining.

One of the most interesting and gratifying features of recent mining developments in Victoria, says the *Australian Mining Standard,* is the success attending deep mining operations on the Bendigo field. The days of surface scratching, so far as that group of mines and many others in Victoria are concerned, have long passed, and the persevering effort that has been directed for many years past to testing the deep ground is now meeting with substantial reward. Perhaps the most important work lately performed on Bendigo in connection with deep mining is that carried on by the Garibaldi Company on the New Chum line of reef, and a highly interesting report on this subject has lately been presented by Mr. E. J. Dunn, who has rendered such good service in underground survey work at Bendigo. Mr. Dunn says that the reef now being worked in the lowest level of the Garibaldi mine is the lowest saddle stratigraphically that is being operated upon in the district. The depth of the reef from the surface is 2170 feet, and the height of the quartz is 30 feet, the breadth over the cap of the saddle being 21 feet 6 inches, and at the cap it is 5 feet wide. "Owing to the fact that the Garibaldi mine is situated on the spot where the pitch culminates, all the reefs met with are at higher elevations in this mine than in mines either to the north or the south of it. Southward, this same reef has been broken into by the Shenandoah Company at 150 feet lower level as regards sea level, while northward, at Lansell's 180 mine, the cap of this reef should be cut at a depth of about 2850 feet from the surface, or at a depth of 610 feet more as regards sea level, than at the Garibaldi mine. The bottom of the Garibaldi shaft is now 2280 feet from the surface, and is 140 feet deeper into the strata than the bottom of the 180 mine. It is most satisfactory to note that at this depth the country rock, in which dark or black slate predominates, is as favorable in aspect for gold, and as strongly impregnated with sulphides, as near the surface. It is, in fact, now proved that the lowest zone of rocks yet touched is auriferous, and this along one line of reef alone implies further resources as regards gold of great magnitude. The quartz in the lowest or Garibaldi new reef is seamed with black slate in the manner coosidered most favorable by the mining men. Gold is to be seen freely disseminated in some parts of the exposed lode, and crushings of 1903 loads have yielded 1702 ounces of gold. Measured transversely or at right angles to the strike, this saddle reef has a superficial area of 400 feet. This is taking the reef over the cap of the saddle, and excluding both east and west legs. Taking 12 cubic feet in the solid as a load, the result shows that for each foot in length, where now being worked, the saddle reef produces over £100 worth of gold. Judging from the continuity of all the reefs that have been worked along this line at higher levels, it is reasonable to expect that this lowest reef will be worked for miles in length. Of course it is not probable that such very rich stone will be continuous for very great lengths, nor that such a large bulk of stone will be found for long distances, but similar rich sections may certainly be anticipated at intervals along the course of the reef. There is, as yet, no indication whatever that the full depth of the gold-bearing strata on this goldfield has been reached, and thanks to the splendid pioneering work done by Mr. G. Lansell and others, the oossibility of pursuing gold-mining at a depth of 3000 feet or more has been demonstrated."

Cheapening Treatment of Ores.

Eight or ten carloads of machinery are now at Prescott Junction awaiting shipment to the United Verde Copper Company's works at Jerome. This machinery belongs to the refinery plant to be erected at that point, upon the completion of which the shipment of matte from Jerome will be a thing of the past, as the pure copper will be shipped instead. This will be a great saving, both in freight and treatment of ores, to the company, and, of course, will enable them to work a vast quantity of ore which they have not been able to handle. Every move which cuts down the handling of ore one dollar a ton gives that much more margin to the mine and makes marketable a vast quantity of ore. In this way, and in this way alone, will this section be made to come to the front. Many enterprises have fallen through in this section because capitalists insisted upon having dividends before a plant sufficiently complete was on the ground to do justice to the mines. It is contended, and backed up by good argument, that the Howell camp, on Lynx creek, would to-day be one of the greatest in the southwest had complete works and a refinery been put up at that point to start on. There are two classes of miners who have, with hardly an exception, made money in this section. The first class comprises the clear-headed Arizonian, who stuck to the most primitive methods, and, with little expense, run his arrastre and took out his own ore with the help of a partner, or, if the ledge justified, hired help; the other class is composed of nervy capitalists who, having satisfied themselves as to their properties, stop at no expenditure until they have a plant on the ground complete enough to treat their ore in every process that it may require. There is no half-way stage in quartz-mining in this section; it is better to stick to the arrastre than to go half-way on the improved machinery method and fall through.—Prescott (A. T.) Courier.

Mechanical Progress.

A Brief Fire-Engine History.

It was not till 1860 that steam fire-engines came into use, although floating fire-engines had been used on the Thames for some years. In 1863 an account was published in the London Times of a competitive test between English and American steam-fire engines, prizes of £250 and £100 being offered for the best and second best. The result was very much in favor of the old country engines though the American ones certainly had many strokes of ill-luck. The Manhattan collided with a tree and was badly damaged before it reached the competition grounds, and the other American engine, Alexander, broke its cylinder cover at the trial. If such a contest were arranged to-day, the odds would be in favor of the machines built in this country, and no one would doubt this for a moment.

In principle all the fire-engines are alike, whether worked by hand or steam. With the steam-engine lies the advantage of continued action, much greater power and the supply of water at greater heights. No effort is made to economize steam in a fire-engine. The main objects aimed at are the rapid generation of steam and its maintenance at a high pressure ranging from 80 to 100 pounds to the square inch. A modern engine may be said to consist of three parts: A powerful coil of tubular upright boiler, the engine, pumps, air-chamber and the carriage. The greatest attention is paid to making the machinery very strong and very simple. Complicated valve-gearing is not to be thought of. Every portion must be in a position where it can be easily reached and the parts must be such that they can be duplicated speedily. An average fire-engine for use in a large city will have cylinders from six to eight inches in diameter and pumps from three and a half to four and a half inches in diameter, the stroke of both averaging about eight inches. All the larger engines are double, as, though each pump is double-acting, that is to say, delivers on both the up and down stroke, a steadier stream is supplied from double pumps.

The capacity of the largest engine is 800 gallons a minute; the average though is not over 600 gallons. The weight of an engine ranges from 7000 to 8000 pounds, and it will be understood that the very best and strongest workmanship is necessary to withstand the unavoidably rough usage incident to a hurried journey over vile pavements. The fire under the engine is lighted automatically, and as the water in the boiler is kept hot by connection with sanitary boilers at the engine houses, the necessary pressure is attained in a few minutes at the most.

There are probably half a dozen makes of fire-engines in the United States all of which rank as first-class. It would be a very difficult matter to select the best, while to take the verdict of firemen would also amount to little, for men who have run all their lives with a particular kind of engine can see very little virtue in those of any other make. Some cities use almost exclusively one make of engine, and others are just as conservative in the use of another make.—Fire and Water.

The Width of Wheel-Tires in Cities.

The subject of the width of wheel-tires as compared with loads carried on omnibuses, heavy drays, etc., moving over the paved streets, says the *Engineering News*, is brought to the attention of the city authorities of Philadelphia, by Mr. James H. Windrim, Director of Public Works, and Mr. Windrim details some bits of practical experience in this line that will be of interest to municipal officers elsewhere. He says that the omnibuses running on Broad street, in Philadelphia, have an average tire of only 2½ in. During the repaving of Broad street, at an expense of $204,643 in 1892, this omnibus traffic was diverted to side streets with lighter pavements. The result was that in 14 days damage to the amount of $6000 was done in displacing paving, broken crossing-stones, sewer manholes and stop-boxes for gas and water. This all happened in an area of 16,635 sq. yds. of street pavement.

It is altogether probable that the damaged side street referred to was of the more antiquated type of street-paving in that city and was stone-laid on an earth foundation. But undue concentration of load should also be avoided in the traffic over a modern pavement with a concrete base, and its greater first cost is only an argument for its better preservation. We pay altogether too little attention to the subject of tire-width, both in our cities and in the country, and it is time that we were putting into practice regulations that have long existed in other countries. We have failed to find any specific American city ordinances on this head, and the late road-law of the State of Michigan, simply providing that users of wide tires are entitled to a rebate of half their road tax, is a rare exception in State legislation of this character.

English road-laws provide that where the load per wheel is from one-half to three-quarters of a ton, the width of tire shall not be less than 3 in.; where the load ranges from three-quarters to one ton, minimum width shall be 4 in., and from one ton to one and one-half tons per wheel, the tire must be at least 6 in. wide. Vehicles with springs may reduce this tire-width 1 in. This law practically coincides with German and French regulations on this subject. To meet this English law the Broad-street omnibuses complained of should have had tires 5 in. wide instead of 2½ in.

The effect of narrow tires, with a heavy load, upon modern street-paving has not yet been carefully studied and reported upon. But it needs no special study to convince an observer that present practice imposes heavier duty upon such pavement than is necessary, in the face of possible municipal legislation. In the case of stone blocks a broad tire may distribute the imposed load over the base of two blocks instead of one, and in the case of an asphalt pavement ruts are much less likely to occur than with the narrow wheel.

But as the change of wheels would be a costly operation in the aggregate, the salient question is, how can this be done with the least damage to individuals? There is no doubt that a compulsory law could be framed and, if need be, enforced. But the better plan would probably be to directly tax the user of narrow tires under heavy loads, and to free from all tax the men who conform to established regulations. Such an arrangement would give time for the change and yet contain an inducement for as rapid a change as possible. This is practically the same principle that now induces the owners of certain newly-built country roads to remit tolls on such vehicles as conform to published tire requirements. Broad tires are certainly better for use on soft or yielding roads; and on paved or well-built macadam roads the tractive force is independent of the width of tire, provided this width exceeds 3 or 4 in. To the objection that English wheels are clumsy and we will not have them, it can be answered that if broad tires are made the law, wagon-builders will soon eliminate the clumsy features. In the majority of our cities, the same street conditions exist that caused the marked failure in Philadelphia; and in such cases, at least, it is conclusively proved that some law of this kind is necessary and that its enforcement would be economical to the community. It seems a bit unwise to adopt modern street-paving methods, and yet to refuse to use every reasonable precaution for the better preservation of these costly pavements.

PRINCIPLES GOVERNING ENGINES.—In his most recent work on the steam-engine Professor Thurston says that the principles that must govern the engineer in his attempt to select the most efficient type of engine are as follows: (1) The greatest practical range of commercially economic-expansive working of steam. The fluid must enter the cylinder at the highest admissible pressure and must be expanded down to a minimum economical pressure at exhaust. (2) The wastes of heat must be made a minimum. All loss of heat by conduction and radiation from the engine must be prevented if possible and the usually much more serious waste which occurs within the engine by transfer of heat from the steam side to the exhaust, by "cylinder-condensation" and reevaporation, without doing its proportion of work, must be checked as completely as is practicable. This latter condition as well as commercial considerations, limits the degree of expansion allowable. It also dictates high speed of engine. (3) The largest amount of work must be done by the engine that it can perform, with due regard to the preceding conditions. This condition compels us to drive the engine up to the highest speed and to adopt the highest practicable mean steam-pressure —Power.

IT is stated that a form of ball-bearing has been applied to the spindles of textile machinery, and by its use it has become possible to run at enormously high rotative speeds. From 8000 revolutions per minute is the speed usually attained, and even 10,000. It is claimed that speeds as high as 16,000 can be reached.

TO MAKE a glue that will resist the action of water, boil one pound of glue with two quarts of skimmed milk.

Scientific Progress.

City Refuse Disposal.

Experiments made in Naples show that the street-sweepings there are 1319 times richer in living bacteria than ordinary liquid sewage, and in Munich the living bacteria found in one gramme of street-sweepings ranged from 8000 to nearly 13 000,000 These experiments show that this material is peculiarly favorable for cultivating the micro-organisms, and rain upon it facilitates this growth. The volume of street and house refuse, separate from human waste, is enormous in a large city, and the returns from six English cities, including London, Liverpool and Leeds, show an average volume of about 180 tons per 1000 inhabitants per annum. The treatment of this 300 000 to 400,000 tons of refuse in New York is a serious problem, involving enormous annual expenditure. But the present disposal practice is crude and unsafe, and something better should be done.

A recent proposition, says *Engineering News*, to dispose of about 10,000,000 cu. yds. of New York refuse by filling in about 400 acres of Long Island Sound, east of and adjacent to Riker's Island, might be temporarily a relief, as far as transportation is concerned; but from a sanitary standpoint, such disposal is certainly open to serious objections. The cost of burning refuse in properly-designed furnaces ranges from 12 to 54 cents per ton, according to statistics gathered by Mr. Boulnois, the city engineer of Liverpool; and in a destructor lately erected by him for Liverpool, the cost is 30 cents, exclusive of interest on the plant, and each furnace, of from 8 to 10 tons capacity, cost about $4000. For the city of Edinburgh, Prof. George Forbes proposes the use of the ash-bin refuse as a fuel for generatiog electric light. But as the refuse consumption must go on contiouously, and the light is only needed at night, he proposes to use the fuel for pumping water into a storage reservoir and then converting this stored water into hydraulic power, through turbines, to run the dynamos Prof. Forbes estimates that for this service 10 pounds of ordinary ash-bin refuse is equal in fuel value to one pound of common coal. This plan requires favorable local conditions for its successful operation and the still more difficult condition of a more perfect system than we have for separating and collecting garbage, street-cleanings and house refuse.

Other great cities find refuse disposal quite as serious a problem as does New York. Berlin removes its street-sweepings to a safe distance beyond the city limits and takes especial care to prevent it from contaminating water-courses. London treats its sewage chemically, but until lately, at least, permitting the sorting of its street and house refuse—a practice which is properly condemned as leading to the possible introduction of foul and infected matter ioto the slums of a city where it is liable to do most harm. Liverpool, in 1891, sent 145,032 tons of refuse to sea in dump-barges at a cost of 37 cents per ton, including the loading. But as in New York, complaint is made that this system breaks down in stormy weather and the matter is dumped at points from which it is washed up again on to the shores. A garbage-collecting company in St. Paul, Minn., is now entering into a contract with the city authorities to collect garbage, on alternate days, in tight hardwood barrels, and to utilize this material in converting a sandy district of 10,000 or 12,000 acres, at some distance from the city, into a market garden district. With what success remains to be seen, for previous attempts of this kind have been very unsuccessful commercially.

In a word, the refuse of a city like New York is very great in volume and includes such a vast variety of rubbish in its composition that the problem of disposing of it is a most serious ooe in its dimensions. Dumping into the sea at points remote enough from land not to interfere with navigable channels, or to be cast back upon the shores, would be doubtless the best immediate solution. But experience proves that it does not work at all seasons, and the supply of refuse is constant and growing. To burn it requires an enormous outlay for plant and maintenance, and care that the operating is not a nuisance to surrounding habitations. To attempt to separate it according to its fuel value is almost impracticable; and to permit culling by contract for rags, iron, tin, etc., is to invite disease into quarters already too dangerous and difficult to watch. But when we consider that the sanitary well-being of two millions of people may depend upon the manner in which this refuse is disposed of, it is seen that some intelligent solution of this complex problem must be reached.

Modern Development and Uses of Fuel.

At the recent annual meeting of the Society of Chemical Industry, London, Prof. J. Emerson Reynolds, Professor of Chemistry at Trinity College, Dublin, in the course of an address, said that the people of England were too much prone to presume that coal would always be a cheap fuel, and that the supply was inexhaustible; but both assumptions could be shown to be erroneous. The reasons for concluding that coal could not very long remain a cheap fuel were not far to seek. Labor combinations in various parts of the world tended to increase its cost directly or indirectly. Those combinations were to a certain extent the consequences of the operation of economic laws, and in so far were not mere accidental factors. The wider distribution of manufacturing activity tended in the same direction, and the increase in depth from which coal must be won led altogether and regularly to greater cost of production. Therefore, some causes which were continuous, and others which were spasmodic in their effects, must make coal dearer. The immediate practical effect of such considerations should be to check waste in the use of coal, but he feared they had not gone very far in that direction as yet, since few realized the extent of the danger ahead. He held that a question pressing at present was how to combine economy in the use of coal with smokeless combustion and domestic convenience. The answer was sufficiently obvious. They must more or less completely gasify the coal prior to its complete combustion. The late Sir William Siemens showed them long ago how to convert coal completely into gas by means of his great "producer" furnaces, and demonstrated the applicability of the comparatively poor "producer" gas to operations requiring very high temperatures, as well as to the minor work of steam-raising. Siemens showed that when so used, 1 ton of coal could perform as much work as 1.7 tons burned in the solid form. In such comparisons the producer gas was, of course, burned at a short distance from its source and under the regenerative system. That mode of using coal seemed to be the most economical of which they had had practical experience, but the gas which it produced contained a large proportion of useless nitrogen, and therefore was not rich enough in combustible matter for general distribution.

The Wilson method of gasifying coal and that employed by the Leeds Forge permitted the production of a richer gas. The Wilson process involved the formation of a certain proportion of "producer" gas in raising the temperature of the coal up to the point at which it could decompose steam, and then produced a mixture of carbon moooxide and hydrogen, or so-called "water gas." The former could be used for steam-raising or furnace work in the immediate vicinity of the producer, while the water gas could be transmitted through mains as readily as ordioary town gas, and lost nothing by carriage save its initial heat. Thus one general method afforded two qualities of fuel and gasified the coal in a very economical manner. By the Siemens' method in its modero form, or by the more or less complete conversion into rich water gas, a great saving in coal could now be secured in almost all large operations requiring the command of high temperatures, and the use of such gaseous fuel was so steadily extending that they might expect in the near future to reach the maximum practicable economy of coal in their greater industries and of smoke-abatement as well. Between the complete conversion of coal into gas and the very partial process included in the production of ordinary illuminating gas was a wide gap which needed to be bridged over in the interests of small manufacturers and the domestic consumer alike before they could secure that economy in the use of coal which they knew to be necessary. The true solution involved a compromise much on the lines along which gas-managers were at present apparently working. They would thus see that the best prospect of solving a considerable part of the smoke-fog difficulty seemed to lie in that direction, and it was in the same direction that they were to look for true economy in the use of coal. Hence their duty to posterity and their own immediate interests coincided in requiring the use of more economical methods of using coal, and that which gave promise of the greatest number of advantages involved the conversion of coal, as far as possible, into gaseous fuel.

EXPERIMENTS with different kinds of lights for libraries show that 550 hours of an electric light of 144 candle-power produced no yellowing effect upon the leaves of books, while 240 hours of a 50-candle gas light produced a noticeable change of tone.

SOME NEW AND VALUABLE TECHNICAL BOOKS,

RECENTLY PUBLISHED

DEITE.—A Practical Treatise on the Manufacture of Perfumery Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentrifices, Cosmetics, etc., etc.; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Da. C. Deita, assisted by L. Borchert, F. Elchbaum, E Kugler, H Toepffner, and other Experts. From the German by William T. Brannt, editor of "The Techno-Chemical Receipt Book." Illustrated by 28 engravings. In one volume, 12mo, 358 pages, price.....$3.00

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. Georges Langbein, Proprietor of a Manufactory for Chemical Products, Machines, Apparatus, and Utensils for Electroplators, and of an Electroplating Establishment, in Leipzig. With additions by William T. Brannt. Illustrated by 125 engravings. In one volume, 8vo, 404 pages Price $4.00

LARKIN.—The Practical Brass and Iron Founder's Guide. A Treatise on Brass Founding, Molding, the Metals and their Alloys, etc. By James Larkin, late Conductor of the Brass Foundry Department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Illustrated. 12m, 400 pages. Price, ...$2.50

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hektograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks, Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stamp and Stencil Inks, Wash Blue, etc., etc. Translated from the German of Sigmund Lehner, Chemist and Manufacturer, with additions by William T. Brannt. Illustrated. 12mo, 230 pages. Price.....$2.50

OSBORN.—The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S Osborn, LL.D., author of "A Practical Manual of Minerals, Mines and Mining." Illustrated by 44 engravings. 12mo, 175 pages. Price $1.50

WAHNSCHAFFE.—A Guide to the Scientific Examination of Soils. Comprising Select Methods of Mechanical and Chemical Analysis and Physical Investigation. Translated from the German of Dr. Felix Wahnschaffe. With additions by William T Brannt. Illustrated by 25 engravings. 12mo, 177 pages. 12mo Price $1.50

Descriptive circulars giving the full tables of contents of the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues and circulars, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. Tabor, Pres.; Leonard Gow, V. Pres.; H. A. Jones, 2d V. Pres; P. Geo. Gow, Technical M'g'r. and Ass't Treas.; T. L. Wiswall, Gen'l M'g'r. and Sec,v; Peter McCourt, Treas.; W. L. Cooper, Eng.

TRADE MARK.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

(MacARTHUR-FORREST PROCESS)

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co, Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co, Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal.; The Gro Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5 00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926. Gen. Mgr and Secretary.

Useful Information.

Lightning and Thunder.

Three kinds of lightning have been distinguished by Arago: 1. The zigzag flash or "forked-lightning," of ordinary occurrence. The zigzag form is probably due either to the presence of solid particles in the air or to local electrification at certain points, making the crooked path the one of least resistance. 2. Sheet lightning, in which whole surfaces are lit up at once, is probably only the reflection on the clouds of a flash taking place at some other part of the sky. It is often seen on the horizon at night, reflected from a storm too far away to produce audible thunder, and is then known as "summer-lightning." 3. Globular-lightning, in the form of balls of fire, which move slowly along and then burst with a sudden explosion. This form is very rare, but must be admitted as a real phenomenon, though some of the accounts of it are greatly exaggerated. Similar phenomena on a small scale have been produced (though usually accidentally) with electrical apparatus. Cavallo gives an account of a fire-ball slowly creeping up the brass wire of a large highly-charged Leyden jar, and then exploding as it descended; and Plante has recently observed similar but smaller globular discharges from his "rheostatic machine" charged by powerful secondary batteries.

The sound of the thunder may vary with the conditions of the lightning-spark. The spark heats the air in its path, causing sudden expansion and compression all round, followed by as sudden a rush of air into the partial vacuum thus produced. If the spark be straight and short, the observer will hear but one short, sharp clap. If the path be a long one and not straight, he will hear the successive sounds one after the other, with a characteristic rattle, and the echoes from other clouds will come rolling in long afterward. The lightning-flash itself never lasts more than $\frac{1}{10000}$ of a second.

The damage done by a lightning-flash when it strikes an imperfect conductor appears sometimes as a disruptive mechanical disintegration, as when the masonry of a chimney-stack or church-spire is overthrown, and sometimes as an effect of heat, as when wires and objects of metal in the path of the lightning-current are fused. The remedy against disaster by lightning is to provide an efficient conductor communicating with a conducting stratum in the earth.—Electrical Age.

USES OF RESIN.—There are many useful purposes, says *Engineering*, to which resin can be applied outside of those of general practice. As a nonconductor of heat it is used in the protection of water pipes, particularly in crossing bridges where the pipe is laid in the middle of a long box and the whole filled with melted resin. Resin is also used in supporting basement floors in machine shops, which may be laid over some dry material, as spent molding sand, which is carefully leveled off, and the plank laid upon temporary supports separating it about two inches above the sand. Numerous holes, about two inches diameter, being bored through these planks, melted resin is forced through them by means of funnels until the whole space is solidly filled, and then the upper flooring is laid upon these planks. In case the floor is subjected to shocks sufficient to break the resin, it rapidly joins together again in much the same manner as the regelation of ice. Resin is also used to form waterproof paper for use in butchers' shops, fish markets, and also for building purposes, and, strange to say, this improvement reduces the cost of the paper. All methods of applying resin in solution after the paper is finished add heavily to its cost and also render it very brittle; but if the resin is dissolved in potash and mixed with the pulp in the beating engine and this alkali afterward treated with alum, it becomes neutralized and washed away, leaving the finely diffused resin throughout the whole mass. It is also used for protecting the coarser manufactured products, such as agricultural implements, against rust by mixing it in a solution with benzine. This is applied as varnish, and the benzine rapidly dries away, leaving a coat which protects the material until it goes to the severe service of actual use.

IT seems that peat has been permanently adopted as fuel for locomotives on the Vadstena-Oderhous Railway in Sweden, after a series of exhaustive tests to determine its relative value as compared with coal. In the final tests a locomotive pulled a train at regulation speed, and up the steepest gradients, steam being maintained at full pressure, even with cold water fed into the boiler.

ALUMINUM IN BUILDING.—A new departure in building is to be made in a structure to be erected at the corner of State and Madison streets, Chicago. It will be 16 stories high, with a frontage of 66 8 feet on State and 106 feet on Madison street, the exterior of which is to be of aluminum and glass. Aluminum has been used considerably for inside work of buildings, such as elevators, railings, etc., but never before for outside work, save in a small way, for ornamentation. More than $500,000 will be expended on this building, and it will be a work of art in every way. The first story will be of ordinary height, and the upper ones 12 feet, 10 feet 6 inches and 11 feet in the clear. The windows will occupy the entire distance between the floors, except the small space required for the mullions, and each window will be of two sheets of glass 11 feet long joined at the center by a strip of aluminum, making practically one plate of glass 22 feet long. On each side will be a smaller window for the purpose of ventilation. The mullions between the windows will be covered with a plate of aluminum. On the State-street side will be three and on the Madison-street side four columns of aluminum running from top to bottom of the building, designed in ornate and pleasing forms. The window-frames will be covered with gold leaf, and the interior decorations will be of the most elaborate sort.—Manufacturers' Gazette.

ANOTHER FAVORABLE COMPARISON OF OIL FUEL.—When the interest among the naval and stationary engineers is so continuously directed to the question of utilizing oil as a fuel under boiler furnaces, it is interesting to observe something of the relative economy, under favorable circumstances, of coal and oil. In New Jersey, in competition with anthracite slack and Westmoreland coal, it has been found that if the oil be at 24 cents per gallon, it would compete with coal at $3.95 per ton, at a test of a 6000 horse power boiler plant. With coal at $3.10 per ton, and oil at 2.25 cents per gallon, the coal was cheaper; and where, in the coal district, that fuel could be got at $1.50 per ton and oil at 1.5 cents per gallon, the oil cost one-third more than the coal. The theoretical evaporation of ordinary oil is about 21 pounds of water per pound of oil, and they have been experimentally able to get 16.7 pounds of water per pound of oil 63° B. in New Jersey, and in New England 17.8 pounds of water to steam at 90 pounds per pound of oil. This evaporation is secured by that method by which the oil vaporized to gas in a retort is carried forward to meet warmed air at the burner. A much more efficient combustion is obtainable than when the oil comes as a fluid to the furnace, and many of the difficulties connected with the fouling of the heating surface are avoided.—American Manufacturer.

A SUCCESSFUL experiment in tempering curved armor-plates which have been subjected to the Harvey process was recently made at the Bethlehem works. The plate used weighed 14,000 pounds and was 10½ inches thick. The curvature was about the same as that of the plate used on the turret of the Miantonomah. Ice water was used in tempering, and the contraction was very slight. Borings from the plate were examined at one-eighth of an inch in depth and its solidity was satisfactory. The plate was then suspended in a tank of oil for a while, and afterward removed for examination as to shrinkage.

Electricity.

INCANDESCENT LAMP PATENTS. — The great litigation over incandescent lamp patents was ended on Oct. 4 by a decision of the United States Circuit Court of Appeals, the court of last resort, sustaining the Edison patent No. 223,898, dated Jan. 27, 1880. The opinion, prepared by Judges Lacombe and Shipman, lays stress on the practical results achieved by the invention, and holds that substituting a carbon filament for the platinum wire described in Edison's French patent of 1879 was a patentable improvement. The opinion says: "Edison's invention was practically made when he ascertained the heretofore unknown fact that carbon would stand high temperatures without disintegration, even when very attenuated, if operated in a high vacuum." This decision is the last of three important ones, all of which have sustained the Edison patent. The first was delivered by Justice Bradley, of the United States Supreme Court, at McKeesport, Pa., in 1889 The second was handed down by Judge Wallace, of the United States Circuit Court, a few months ago. The Edison Co. will be entitled to a heavy accounting from manufacturers of incandescent lamps for past profits, but the patent has a little over four years more to run, so the public will not have to pay increased prices for lamps very long if the prices are raised. Another important electric patent case decided on the same day by the same court was that of the Brush Electric Co. vs. The Electric Accumulator Co., in which the plaintiff's patent, No. 337,299, was sustained. The defendants in the case owned the Faure patent, patented Jan. 3, 1882. These two patents were the subject of an interference case in the Patent Office, but the Brush patent was finally granted. The patent thus sustained is a fundamental one. Another patent of the Brush Co., No. 266,090, involved in the same suit, was held by the court to be not infringed.—Engineering News.

STORAGE BATTERY TRACTION IN NEW YORK.—It is now definitely announced that a storage battery system is to be installed in this city on the Second Avenue line by the Waddell-Entz Company. A powerhouse is to be constructed at once and ten cars equipped throughout with Waddell-Entz apparatus are to be placed in active service. The installation will not be radically different from that which has been hitherto employed in such plants. We are glad that the storage battery is to have another fair opportunity to assert its right to a place among the practical systems of street railway traction of to-day. It bas thus far failed to do so, but it is to be operated here in New York under favorable conditions and the result, whatever it may be, will have an important bearing on the future of storage battery traction. It seems rather unfortunate that the attempt should be made on a line which follows the elevated railroad structure where the last objection to its rival, the trolley, is removed, with which, under these conditions, it could hardly compete. Tbat cars equipped with storage batteries can do the required work and do it satisfactorily, cannot be doubted; whether they can do it economically is another question and one whose solution will be looked forward to with interest.—Electrical World.

THE Eastern railroad of France bas been making experiments in the electric lighting of trains by means of primary batteries. The cell used is the Meritens, a modification of Smee's cell. The electrodes consist of a plate of amalgamated zinc and of platinized lead. A gutter at the bottom of the cell is filled with mercury, and serves to maintain the amalgamation of the zinc. The electrolyte is dilute sulphuric acid. Ten elements are enclosed in a water-tight case. The electromotive force of the cells is .9 volts. In lighting, all the cells are not used when the battery is new, but two are kept in reserve, to be brought into use when the resistance at the cells has been increased by the formation of the zinc sulphate. Two batteries of a total weight of 265 pounds are placed under each car, and are found capable of maintaining eight lamps at full power for 48 hours, the cost per lamp-hour being 1.4 cents.

A NOTICEABLE feature of the new power stations in this country is the tendency to the use of larger units in both the electrical and steam equipments. In one of the new central stations to be built in St. Louis, for which the contract has just been closed with one of the largest manufacturing companies, it is announced tbat only three generators of 800-horse power each will be used for tbe operation of 65 cars, eacb of these being equipped with motors aggregating 50-horse power. This installation will also have that other feature which is becoming deservedly more popular in lighting as well as power plants, of coupling the engine and generator direct to the same shaft. Several large lighting plants already embody this metbod of construction, but it has not been introduced to any great extent in railway practice.

NEW USE FOR ALUMINUM.—The variety of new uses which, under the influence of the glut in the aluminum market, caused by the advent of the electric process, has been found for aluminum is very astonishing. We are now told that it has been found that powdered aluminum can be burnt to as good effect as magnesium for lecture-room purposes, while it is considerably cheaper. On the other hand, this aluminum light is not so actinic as magnesium light. The powdered aluminum cannot be satisfactorily burnt in an ordinary spirit lamp, but the best result is obtained by using such a lamp fitted for receiving in the middle of its flame a supply of oxygen, and into which the powdered metal is simultaneously projected by means of a compressible india-rubber ball. The best light was secured by burning in tbis way a mixture of 100 parts of finely-powdered aluminum, 25 parts of lycopodium, and five parts of ammonium nitrate. It has been erroneously stated that this mixture leaves no smoke.—London Electrician.

THE most recent estimate of the capital invested in the electrical industries in the United States is $720,000,000, and of this amount $350,000,000 represents the proportion which electric-lighting and power have attained; $100,000,000 is also the estimated investment in electrical supplies, of which the electric-lighting and railway appliances constitute a large proportion.

SHEET IRON PIPE

IRON PIPE
ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES,
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints
DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

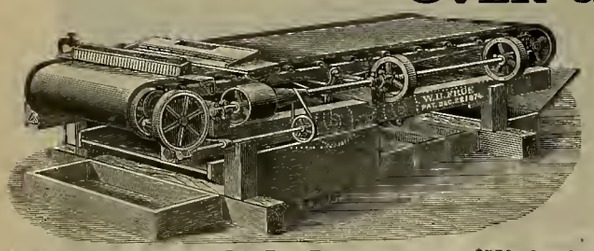
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUS in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.

No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

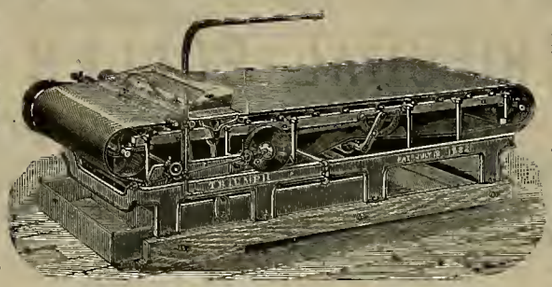
The competitive trials which have been held between the Trinmph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

—o—

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1886.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $575. f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.

THE SAN JACINTO ESTATE—Office of the General Manager. CAJALCO, Oct. 30, 1891.

GEO. E. WOODBURY, ESQ.—DEAR SIR: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O address, South Riverside, San Bernardino County.

CAJALCO, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully, S. HARRIS.

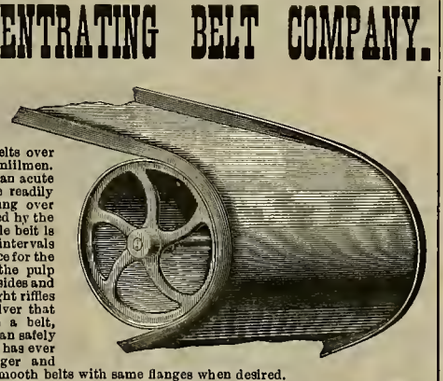
PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

CLEANUP.—Amador *Record*, Oct. 27: A cleanup was made last Saturday at the Pacific mill at Plymouth of a crushing of 250 tons of ore from the Bay State mine. The result was very satisfactory, as the yield was 10½ pounds of gold, or a trifle over, $9 per ton. The company is well pleased and feel more confident than ever that they own a valuable property. Dr. Boydston, one of the principal stockholders, was up from San Francisco to see the result of the run, and he was highly pleased therewith. The company has ordered a new pump from Knight & Co., and as soon as it can be gotten in, will resume operations on a more extensive scale than ever in the mine. Plymouth folks generally are highly elated over the prospect at the Bay State.

RUNNING AGAIN.—The Clinton mine at Wieland closed down some time ago, owing to a scarcity of water in their main ditch. One of the county papers had it that the mine was closed down permanently. Such is not the case, for our Wieland correspondent writes that the 30-stamp mill is started up again.

CRUSHING ORE.—A crushing of 110 tons of quartz from the Wheeler & Wild claim in Shenandoah valley is being made at the Cosmopolitan mill. The mine is located three miles northeast from Plymouth, and W. J. and C. W. Wild and N. E. and Arthur Wheeler have it bonded. They have sunk a shaft 30 feet on the vein, and the prospects for opening up a good mine are said to be quite flattering.

A LIVELY DISTRICT.—From all accounts, Pioneer district is having quite a lively mining boom. For several months past, active work has been going on in many newly located quartz claims, while parties have also inaugurated work on a number of mines which have lain idle for some time. They have some good prospects there, and expect to open up at least a few first-class properties.

MILL STARTED UP.—Active operations have been resumed at the Quartz Mountain mine, with John Palmer as superintendent. The mill has started with a Mr. Kyle of San Francisco in charge. Mr. Palmer is a number one, practical man, and it is safe to say that he will manage the affairs of the company to the best possible advantage.

GONE EAST.—W. G. Whorf, the well-known mining superintendent, writes the *Record* from San Francisco that he will take his departure at once for the East to place some mining property, in which he has become interested, on the market. Mr. Whorf is a "rustler," and we hope he will succeed in his undertaking.

SOUTH EUREKA.—At the South Eureka mine they have put in a skip which will raise 750 gallons of water at a trip. A big body of water was struck a few weeks ago, and it was found difficult to handle it, but now it can be controlled readily. Sinking will begin again in a few days.

Butte.

NEW CAPITAL AT BANGOR.—Oroville *Mercury*, Oct. 25: W. G. Hay, of the Hay & Clark mine, Bangor, was in to-day. In addition to their already large mine, they now, in company with ex-Congressman Berry and S. J. Stabler, of San Francisco, have charge of about three miles of the lead extending between the Catskill mine and Kentucky ranch. A company is being formed to work it and Mr. Hay says we may expect a large influx of capital to that section in a short while. All the mines there are paying well, and the outlook grows brighter every day. The Bishop mine is about sold to a company from below, and the owners of it will realize a nice little sum.

Nevada.

POCKET-MINING. — Grass Valley *Telegraph*, Oct. 31: Our local contemporaries have all dropped on the item that two professional pocket-hunters are traveling through the foothills of this county, and are prospecting many heretofore undisturbed quartz ledges. That kind of mining has been going on for years in the region west of Grass Valley. Those pocket-miners pursue their business in a systematic manner, and have certain rules which they follow in order to discover a rich pocket in a quartz ledge. They do not depend on luck or haphazard in finding a pocket, but they observe indications which show them when a pocket is near, and they find it and work it out and say nothing about it. They do not make locations, nor do they work a ledge beyond the pocket. It is a matter of skill and judgment, this thing of being a "pocket miner." Some of these hunters of pockets have made big money and have large bank accounts.

PLACERS.—Nevada *Herald*, Oct. 26: Owners of small placer claims are preparing them for the rainy season, at which time they can be worked. Ravine-mining led to the discovery of some very rich float rock at French Corral last winter, and the discoverers are now waiting for the winter rains to supply them with water and soften the ground. Then they will resume their search for the ledge from which the float rock was detached. If found it will prove a good thing.

SEVEN-THIRTY MINE.—Grass Valley *Union*, Oct. 29: The *Union* is informed by Superintendent Taylor, of the Seven-Thirty mine, that the new hoisting and pumping machine which has been erected on the mine is in complete working order, and that all the water has been pumped out. The shaft is 170 feet in depth, and operations for sinking are to be commenced immediately. It is also the intention to extend the south drift at the depth of 160 feet to strike the pay shoot in the direction of the old Bowery ground, from which quartz was taken when the mine was last operated by lessees who held a short bond on the property. As is well-known there has been a quantity of very rich quartz taken out in that portion of the mine, which indicates the presence of a regular pay shoot. The new plant that has been erected on the mine is of sufficient capacity for development work, which will be carried on systematically. The Seven-Thirty mine is located in the southwest portion of the Grass Valley district, which heretofore has not received the attention that practical miners think it deserves.

THE DELHI DISTRICT.—Nevada *Transcript*, Oct. 27: The quartz-mining region on the Middle Yuba river and Grizzly canyon is tributary to this city, and, as a consequence, when the claims there are doing well a fair share of their output finds its way, by one means or another, into the not unwilling hands of the county-seat denizens. The Delhi, which used to be so productive, but has for awhile until quite recently been treated rather harshly by the fates, is again rising to the top of the waves of prosperity. One thousand feet in from the mouth of the 1500-foot tunnel the company recently sank 30 feet and found a big ledge, the ore of which mills over $30 a ton. Hoisting and pumping machinery is to be put in the tunnel this fall and the shaft will be sunk to a depth of 150 feet, where drifts will be started. At the Enterprise, west of the Delhi, over two years of faithful and expensive prospecting resulted last week in the striking of a large and good ledge. The company had about concluded to "throw up the sponge" when the strike was made. Years ago, in the Live Oak, which is a half mile west of the Enterprise, a tunnel was run and a ledge eight feet thick, or more, was found. Recently a San Jose company bonded the property and taking a crushing from the ledge had it milled at the Delhi with good results. The company has laid in supplies and will thoroughly prospect the property this winter. The St. Gothard shaft, down 400 feet on the ledge, is now being sunk deeper by contract. The tunnel from Grizzly canyon will connect with the shaft at a perpendicular depth of about 300 feet. The mine is looking so well that the stockholders feel confident they will be eventually well repaid for all their outlay of money, as well as for the risk they took in embarking in the venture. The Grizzly Ridge or McAuslan mine, on the Middle Yuba river below the Live Oak, is owned by residents of this city and North Bloomfield. There are two ledges in the location, one a large one of fair grade and the other smaller, but abounding in "specimen" ore. There is now on the dump 40 tons of quartz ready to crush. It shows well in free gold and the miners estimate it will pay from $30 to $40 a ton. This mine gives every sign of proving a big one, and it is being opened in good style.

IMPERIAL PAINT AND COPPER WORKS.—Grass Valley *Union*, Oct. 29: This is the name adopted by the new company which has been incorporated to operate on the Spencerville copper mining property. The company has a vast dump from the former workings of the mine, from which metallic copper can be extracted, estimated at 1500 tons of pure copper and 150,000 tons from which mineral paint can be made. The metallic paint made from the ores when reduced is the best in the market, as chemical analysis has shown. The copper which has been produced is of the finest quality, being 99 per cent of pure copper, and the same was used in the sheathing of the cruiser Charleston, which was built at the Union Iron Works, San Francisco. The paint works heretofore in use in the works were on a small scale, but the new company designs establishing a more extensive plant in order to be able to supply the demand for the paint, as the paint works have not the capacity to meet the orders as fast as received. The main office is now at 304 Kearny St, San Francisco, and the officers are P. Herman, Pres.; P. Roherbacker, Treas.; Louis F. Dunand, Sec'y, all of San Francisco, and Otto Woehler of Spencerville, Supt. Until the organization of the company, Mr. Woehler was the sole owner of the property, and has long experience in the copper mining business, being with the old company for a number of years, and was one of the purchasers of the property when it was disposed of by the company. The new company does not at present contemplate taking ores from the mine, but will confine itself to working the ores that are upon the surface from which metallic copper and mineral paint can be produced. The property is one of the best in Nevada county, and its capacity for copper production is practically unlimited. The mine, at the time of its original location, made many years ago, was known as the "Well lead," the strongest copper-bearing lead ever discovered in the county.

PROSPECTS OF A GOOD MINE.—*Transcript*, Nov. 1: A ledge which averages nearly three feet in thickness has been struck in the South Idaho mine, which is situated near the famous Idaho mine, Grass Valley district. The rock is filled with mineral, and in many pieces free gold can be plainly seen. W. J. Rogers, County Superintendent of Schools, who is one of the owners, informed us yesterday that the ledge continues to improve the farther they work on it. The prospects are that a valuable mine will be developed.

THE PROVIDENCE MILL STARTS.—Last week the *Transcript* gave an interesting description of the recent rich finds of the lower levels of the Providence mine. Yesterday 15 stamps of the mill started up on a splendid-looking quality of ore. The force of workmen at this mine will soon be increased. One of the ledges recently found has enlarged to eight feet within the past day or two.

Plumas.

RICH DEPOSIT.—*Plumas National Bulletin*, Oct. 27: From several sources we learn that See & Jolly have developed a 2-foot ledge of enormously rich ore in their mine at Granite Basin. Its richness is variously estimated, by some as high as $2000 per ton. That country has been attracting attention for some time, and it contains small ledges of extremely rich ore.

Shasta.

LEASES.—Shasta *Courier*, Oct. 28: The Golden Chariot and other mining property, opened up some years ago by Wm. T. Coleman, near Ft. Dingee, a couple of miles from Shasta, has been leased for six months by Wm. H. Chynaweth of this place, who intends to do some work on the property.

IOO.—Mr. E. L. Ballon is pushing to completion his reduction works on South Fork, and ere long the Yount mill is expected to be put in operation, and then we look for our section to boom. W. Dunham has put on some works at the Black Prince mine, and he with his partners—Gillon and Martin—are expecting to take out some very rich ore. Robinson & Son are doing some work on some of their mines. Brown & Lewis have struck some very fine ore on Andrews creek.

Siskiyou.

PLACERS AND NUGGETS.—Yreka *Journal*, Nov. 2: J. M. Patterson and S. M. Morgan were in town last Sunday, and had some fine nuggets from their newly-discovered ledge on Eddy's gulch, Salmon river, near Sawyer's Bar. The sample shown us weighed about 8 ounces, and seemed to be almost solid gold. They took out six pieces from the decomposed croppings of about the same size, with not more than a quarter of an ounce difference in the weight of each nugget. They have sunk down where the rock is more solid, and find it impregnated with gold to the richest extent. They may possibly find the ledge a bonanza of great richness and extensive, at least we hope so. The miners in the various placer and high-gulch districts are busily engaged in preparing for winter work, expecting there will be a good supply of snow on the mountains, with occasional rain, to furnish water for operating the hydraulics and to carry on ground-sluicing with great success. The drift claims worked steadily during the dry months, have also furnished a great amount of rich gravel for sluicing, and the full supply of water in the streams will start the various quartzmills dependent on waterpower.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Enterprise*, Oct. 29: 1100 level—The west crosscut from the main north lateral drift, 315 feet north from the shaft station, has been advanced 28 feet; total length 316 feet; in porphyry and clay, carrying streaks of quartz. 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. 1600 level—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted. 1650 level—Continue to extract some ore from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. Also some ore from the old stopes at the north end of the California ground. From the crosscut run west from the northwest drift we are running north in the old stopes and extracting some ore. 1750 level—Have continued to extract some milling ore in working upward from the sill floor in east crosscuts Nos. 3 and 5 from the main south drift, and from this point where the upraise from the end of the drift run south from the end of the crosscut run west from the end of the main southwest drift connects with the 9th floor openings. Are extracting ore along the drift which connected this upraise (45 feet up) with the upraise 44 feet east. On the sill floor, at the bottom of this last-mentioned upraise, the south drift has been advanced 23 feet; total length 55 feet; in a quartz formation, carrying a low assay value. In this main southwest drift opposite east crosscut No. 5 a west crosscut has been started and advanced 18 feet in a quartz formation of low assay value. Have continued making repairs to the southwest drift. 1800 level—There has been extracted from all parts of the mine during the week 970 860-2000 tons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was $25.79 per ton. The average assay value of all the ore worked at that mill during the week, 930 tons, was $22.27 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $18,325.76.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, west crosscut No. 2 has been advanced 5 feet; total length, 172 feet; in a very hard porphyry formation. From the south drift opposite west crosscut No. 2 an east crosscut has been started and advanced 12 feet in a quartz formation. Twenty-seven tons of ore have been taken from this drift and raised to the surface, the average assay value of which is $19.25 per ton.

MEXICAN.—On the 1465 level the west crosscut, started from the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 44 feet; total length, 172 feet, continuing in a hard porphyry formation. Have stopped work in this crosscut and resumed work in the north drift, which has been extended 17 feet; total length, 247 feet; formation, porphyry, showing some clay.

ANNEX.—On the 420 level, east crosscut No. 1 north was advanced 11 feet; total length 192 feet; formation porphyry and clay. From end of this east crosscut a north drift has been started and advanced 5 feet.

GOULD & CURRY.—200 level—The northwest drift, started 435 feet from shaft, has been advanced 18 feet; total length 514 feet. West crosscut No. 5 has been extended 16 feet; total length 57 feet; face in porphyry and quartz. On the Sutro tunnel level, the joint north drift with Savage Company has been advanced 20 feet during the week; total length, 630 feet; face in porphyry.

BEST & BELCHER.—900 level—All work on this level during the week has been on repairs in the north drift and in west crosscut No. 2.

HALE & NORCROSS.—1500 level—Have finished repairing the incline station on this level. 1800 level—During the week advanced No. 1 west crosscut 18 feet; total length 93 feet; face in quartz. West crosscut No. 2 on this level was advanced 12 feet; total length 70 feet; face is in nearly all quartz. West crosscut No. 3 was advanced 18 feet; face in quartz and porphyry. The west drift on the 150 level of the old or A-street workings was extended 10 feet; face in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted and milled 172 tons of ore at the average value of $17.25 per ton. Have done no work on the 750 level this week. The Zadig drift, Sutro tunnel level, has been extended 12 feet in hard porphyry.

UTAH.—340 level—The north drift from west crosscut No. 2 has been extended 16 feet; total length, 130 feet. This drift continues in porphyry, clay and quartz formation.

CHOLLAR.—We are retimbering and repairing the west drift, 350 level. The east crosscut, 160 feet south of north line, 930 level, is out 178 feet; face in soft clay and porphyry.

WAAN SHAFT.—The joint east crosscut on the north line of Alpha, 1800 level of the Ward shaft, is out 51 feet, face in hard porphyry. The joint Potosi and Bullion west drift, 1800 level, is out 1016 feet; face in porphyry.

NEW YORK.—West crosscut 110 feet north of the shaft, 800 level, is out 51 feet; formation quartz. During the past week we have hoisted 56 carloads of ore from the 650 and 700 levels, which will average about $35 and $40 per ton.

ALPHA.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, is out 51 feet; face in porphyry.

EXCHEQUER.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, is out 51 feet; face in porphyry.

SIERRA NEVADA.—West crosscut No. 2, from Kenosha tunnel, started from north drift, 800 feet in, has been advanced 30 feet; total length 278 feet; face in porphyry and stringers of quart. The intermediate tunnel between the Cedar Hill drift and Kenosha tunnel has been advanced 20 feet; total length 72 feet; face in soft porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 24 feet; total distance west of shaft 2558 feet; face in porphyry.

UNION SHAFT.—900 level: The joint Union Con. and Sierra Nevada west drift, 900 level, has been advanced 24 feet; total distance west of shaft 2558 feet; face in porphyry.

BULLION.—The west crosscut from north drift, from top of raise from east crosscut, 320 feet south of north line, 1300 level, is out 20 feet; face in porphyry and quartz. The joint southeast drift from the bottom of Potosi winze, 1850 level, is out 178 feet; face in porphyry. The northwest drift from 1800 station, Ward shaft, is out 1016 feet; face in porphyry.

POTOSI.—Extracted and sent to mill the past week 270 500-2000 tons of ore from ths 550, 980, 1150 and 1300 levels. Milled during the week 270 tons. On hand at mill 63 1600-2000 tons. Average battery assay, $20.90. Average car sample assay, $24.82.

SILVER HILL.—Continue taking out ore on the 160, 260 and 490 levels. Have extracted and sent to mill the past week 199 895-2000 tons of ore. Average battery assays, $19.43; average car-sample assays, $22.78.

Kennedy District.

SHIPPING ORE.—*Silver State*, Oct. 29: J. R. Benton is in from Kennedy district with another load of ore from the Imperial mine. After one more trip, a carload of the rock will be shipped to Chamberlain & Co.'s sampling works at Carlin. It will average $150 to the ton, mostly gold. Messrs. Benton and Kennedy, the owners of the mine, have heretofore worked their ore in an arrastre, but the returns were not satisfactory, as it could not be worked to more than one-half its value. They expect to have a mill built in the spring, which will make the Imperial one of the best paying properties on the coast, as there is an unlimited quantity of ore that will not pay to ship, but which can be milled at a handsome profit. The mine has been thoroughly developed by inclines and tunnels, from which all the ore has been taken so far as there has been no stoping done. There are about 300 tons of ore on the dump which will average about $50 per ton. There are now about 15 men working in the district, and there are several prospects which promise to equal the Imperial. All in all, there is no doubt but that Kennedy district has a bright future.

Tuscarora District.

THE OUTLOOK.—*Times-Review*, Oct. 24: Regarding the outlook of this camp, it is not so dark as was anticipated. In a conference held with the Messrs. Coffin a day or two since, Mr. Grayson gave orders to proceed with the erection of the cyanide plant as speedily as possible with a due regard to economy, and to keep a limited force at work in the mines in which he is interested. The Union Mill Company has resumed bullion shipments, and will send to the front to-day about $20,000.

Ferguson District.

STRIKE.—Ferguson *Lode*, Oct. 28: A new strike was made in the crosscut of the April Fool which by far eclipses anything yet found in the mine. On the footwall of the ledge was found a body of ore which assays up in the thousands.

MOVING.—Pioche *Record*, Oct. 30: The exodus from Pioche to Ferguson continues. Nine of our citizens departed for that camp on Monday.

Osceola District.

PLACER WORK.—Cor. Salt Lake *Journal*, Oct. 22: At Osceola everything is more prosperous than any camp I visited, because here we find gold. Tilford is running his dry-wash every day and is making from $5 to $8 to the man, and working under many difficulties, owing to his primitive machinery. Drew, Shellenberger and others are running machines. Skinner,

Breckenridge and others are taking out gold with rockers and no one knows how much they make, but they always pay their bills and work steady year in and year out, which is a good proof that there is precious metal in their rockers, if they are single men. The O. G. Co. has made a big run this year. The Cumberland was run in ore all the way, and ore in the face some 100 feet. This has the best showing of gold ore in quartz in the camp, and is a hot proposition.

SILVER.—Over on the east, at the foot of Mara mountain, we find a true silver belt, large and well-defined, carrying silver and lead. I have taken ore from this country that ran 225 ounces silver and 65 per cent lead. I state this to show that there is high-grade ore here, despite reports to the contrary. Dr. Baker has some five or six claims on this side, veins from three to ten feet wide, lead propositions, and I consider this country a second Fish Springs, if it were properly developed, for I know that here is good ore and very large bodies of it. They are strong and many of them have an iron gangue; in fact, all the outward appearances and surroundings indicate to the practical miner that here is a country that will pay the man or men that will go to work and judiciously open them. There is a large field here for capital, and at the present time I know of no better place where money can be expended at so good advantage, as the natural facilities are excellent.

Tuscarora District.

NAVAJO.—*Times-Review*, Oct. 28: Work for the week has been confined to the stopes above the 350-foot level, which are looking about the same.

BELLE ISLE.—The stope above the 350-foot level is looking about the same, and those above the 250-foot level are without material change.

NORTH BELLE ISLE.—North drift, south 300-foot level, extended 5 feet; vein in the face is about the same. The stopes are yielding as usual.

NEVADA QUEEN.—No. 8 raise has made 30 feet, crosscutting the hanging-wall. Hoisted 18 cars second-class ore, assay value $30 per ton. Worked at Union mill 67 tons of ore, battery assay $256 per ton.

ARIZONA.

BIG BUG.—Arizona *Journal-Miner*. Oct. 27: John S. Jones gives a good report of mining on Big Bug, a district which has come into considerable prominence this year on account of rich strikes made. He says that Frank Wright brought in a bar of gold bullion a few days since, valued at nearly $1200, the result of a short run made by his mill on ore from the Little Jessie mine. Messrs. Wright and Butler, during the existence of their lease on this mine, are reported to have taken out between $28,000 and $30,000, while Mr. Wright, who now owns a lease alone, has as much more in sight. Mr. Jones is sinking a double-compartment shaft on the mine, on which he proposes to erect hoisting-works soon. He is now down to a depth of 50 feet, and the ore taken from the shaft has paid the expense of sinking and timbering the shaft. C. M. Clark, who recently took a lease on the north end of this same claim, has his shaft down between 30 and 40 feet and has struck good shipping ore, although the ore-body is very small at present. Some development work recently done on the Little Eva, a claim owned by Dr. J. N. McCandless, was very encouraging, and the development work will be continued. While the district has had nothing like a boom, it has been growing rapidly, during the past few months, into one of the most prosperous in northern Arizona.

BRITISH COLUMBIA.

ILLECILLEWAET AND FISH CREEK.—Kootenay *Star*, Oct. 29: Development work has been completed on all the claims at Fish Creek. The Elizabeth and Edinburg, adjoining claims, both owned by Mr. Ryckman, M. P., and Walter Scott, have turned out wonderfully rich, as anticipated. On the former a shaft has been sunk, which is down 70 feet, being in good ore on an eight-inch solid vein. At the surface the mineral of this ledge assayed from 175 to 204 ounces per ton; at the bottom of the shaft it goes 300 ounces silver to the ton, showing that the ore becomes richer as it descends. The carbonates carried in the lode are very rich, assaying over 700 ounces. There is a large quantity of galena and carbonates on the dump ready for transport to the smelter. They are driving a tunnel to intersect the lode on the Edinburg, which is in about 50 feet, and they expect to strike the vein within another 15 or 20 feet. At Copper Hill the Silver Bow is panning out exceedingly well, and there are over 45 tons of rich peacock ore now on the dump. This ore carries 50 per cent of copper, $29 in gold and $7 in silver. The lode has been traced for about 500 yards at surface, and the vein runs from two to four feet in thickness. Some fine specimens have been taken from this mine.

MONTANA.

MISSOULA GULCH.—*Inter-Mountain*, Oct. 25: A general mining boom is on over in Missoula gulch. To-day, in the Henry mine, some new silver ore was encountered. The lessees to-day secured a lease on the Great Western from James A. Murray, and started a force to work sinking a perpendicular shaft. The gentlemen in that district are very confident of finding a continuation of the great copper belt over there. Some three months ago Messrs. Blight, Bennett & Co. secured a lease and bond on a mining claim situated south of the Volunteer and adjoining the Great Western, across Missoula gulch. A small hoist was erected, machinery was placed on the ground and sinking was commenced. At a depth of 90 feet the ledge-matter assumed a peculiar color and showed unmistakable evidences of the existence of copper ore in that locality. The shaft is now developed to the 100-foot level, the workmen being engaged in cutting a station. The lessers are confident that they have encountered an extension of the great copper ledge which supplies the Gagnon and other producers, and claim that the ore being taken from the Henry is similar in character to that taken at the same depths from the Mountain Con. and Green Mountain mines. Sinking on the ledge is still in progress and will continue until the 150-foot level is reached. When the work of cutting the station is completed a force of men will be put to work drifting. At present some very fine specimens of silver ore are being obtained. The leasers are confident that a large body of copper will be struck within 50 feet of the 100 level, and all the mining experts who have examined the property agree with them. A few years ago the Volunteer mine, which is north of the Henry, was started up by some enthusiasts who believed that this ledge would be discovered by sinking a 600-foot shaft and crosscutting. The Henry leasers believe that they started in too far north, and that had a similar amount of work been done 2000 feet south of the Volunteer, the ground across the gulch would be to-day dotted with a magnificent hoisting works.

NEW MEXICO.

ALHAMBRA.—Silver City *Enterprise*, Oct. 28: Capt. J. H. Fitzsimmons, superintendent of the Alhambra and Hobson properties, reports the great bonanza on the Alhambra as still holding its own. It is proving to be one of the greatest ore-chutes of native silver ever struck on any mine. Already 14 tons of ore, which shows native silver predominating in every piece, have been extracted ready for shipment and yet no diminution of the ore-body is apparent, but the extent of the ore-chute seems to increase as development progresses. Much of the ore will run from $6000 to $10,000 per ton. The company contemplates the erection of a small adobe smelter at the mine for the purpose of running the richer ore into bars, as the ore is of too high a grade to ship by freight, and express charges curtail the profits. It is expected that the ore will produce 50 per cent of its weight or more in bullion. The Black Hawk mine is being worked steadily under the superintending of Col. Twomey. E. M. Hand, the general manager, is absent in Central America, and his brother, Arthur Hand, a prominent young mining engineer from Montana, exercises a careful supervision during his absence. The hoisting-works from the old shaft are being moved on to the new shaft.

MOOOLLON.—Capt. M. Cooney has developed an enormous body of ore on the Silver Fountain, the vein is 12 feet in width and averages $28 per ton in gold and silver. It is confidently asserted, and on good authority, that the Sheridan mill will soon be started on ore from the Little Fannie. The Peacock mine is being pumped out, and ore extraction will be commenced as soon as the mine is drained.

OREGON.

THE ASHLAND MILL.—Ashland *Tidings*, Oct. 31: The stampmill for the Ashland Mining Co. is being set up in the most solid, substantial manner at the Gilroy-mill building, some of the heaviest timbers ever worked in Ashland being used in the framework. Four big wagonloads of ore reach the big ore-bins in the mill every day now from the mine. Quartz prospectors are still scouring the hills near Ashland.

A CRUSHER.—Grant's Pass *Courier*, Oct. 29: Messrs. Taylor and Ezell are making arrangements to erect a Thorn quartz-crusher at a point on Williams creek convenient to Black Oak, Trio, Terminus and Ezell quartz claims. Doc. Taylor went to Portland last week for the plant, which will cost in the neighborhood of $6000. The crusher will be operated by water-power and will run day and night. The Thorn crusher is capable of crushing ore as low-grade as $2 to the ton at a profit, and there are thousands of tons of rock in sight which assay from $15 to $20. Some 25 men will be employed on the works when the plant is in position, and it will be a big thing for the mining interests in that part of Josephine. The location of the works is about 17 miles from this city, on Farris gulch. A chlorination works will be erected in connection to dispose of the concentrates.

UTAH.

PARK CITY NOTES.—*Record*, Oct. 31: The tunnel on the Little Bell group is now in a distance of some 75 feet and some very promising vein matter is being encountered by the owners in the face of it. The Anchor people make use of the waste water coming from the tunnel to drive a water wheel, which furnishes power enough to run a blower and supply the blacksmith shop with air. Dr. LeCompte and partners will make a 50-ton shipment of concentrates from the Rosscamp & Glenn property in a few days. The concentrator is doing good work. J. P. Kelly and Hugh Kilkenny have a force of men at work on the Spring and Horn Silver claims, situated in Snake Creek district. Jerry Richardson now has two shifts of men at work on his concentrator, just below the Crescent mine, and is turning out about ten tons of first-class ore per day. In his lease—the old works of the Crescent—he has uncovered a five-foot vein of good concentrating ore. A 65-horsepower boiler and a 35-horsepower engine, with all other necessary appurtenances, arrived for the Lucky Bill Mining Company Sunday last. Masons are at work bricking up the new boilers at the Silver King hoisting works and everything is being got in readiness so that when the new hoisting engines arrive there will be no delay in getting them into position for the work. When finished, the works at the King will be classed among the largest in the Territory. The lessees on the Barnicott property have their shaft down a distance of 175 feet and are now crosscutting. They have encountered a very promising looking ledge, from which they have obtained assays running from 10 to 12 ounces silver. The crosscutting they are doing is for the purpose of exploiting the ledge thoroughly.

ORE AND BULLION.—There were shipped from the Ontario mill this week 38 bars of bullion containing 23,462.13 fine ounces silver. Following are the ore shipments from the Mackintosh sampler for the week: Ontario, 427,410 pounds; Daly, 253,190; Anchor, concentrates, 248,690; Mayflower, ore, 90,890; Silver King, 105,540; LeCompte, concentrates, 38,910. Total, 1,154,630 pounds.

LEAD AND SILVER.—Lead, New York, per 100 pounds, $3.90; silver, New York, per ounce, 84⅞ cents.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

AMERICAN SMOKELESS BOILER COMPANY—Capital stock, $1,000,000. Directors—Edward Bosqui, Charles S. Spinney, H. B. Sharps, C. R. Alberger and Green Majors.

CALIFORNIA MILK COMPANY—Capital stock, $10,000. Directors—J. H. Nichols, F. E. Shafer, E. E. Raymond, J. W. Harvey and C. F. Harvey.

CLEAR LAKE MILL AND ICE COMPANY—Capital stock, $25,000. Directors, J. K. Firth, D. C. Lewis, H. D. Rodgers, Oscar Lewis, P. H. Reardon and R. L. Murray.

BANK OF LASSEN (Susanville, Lassen county). Capital stock, $50,000. Directors—C. G. Lunington, F. Hines, J. L. McDermott, D. Knock and J. R. Perkins.

GRAVITY FLUSHER COMPANY—Capital stock, $250,000. Directors—R. A. Rose, G. C. Holbrook, W. S. Weymouth, W. C. Lewis and E. B. Mastick.

SAN PEDRO PLANING MILL COMPANY (Los Angeles county)—Capital stock, $25,000. Directors—L. W. Blinn, Thomas Hughes, R. R. Streets, W. A. Driscoll and G. G. Hughes.

The Mining Bureau Museum.

Among the recent additions to the collection of the California State Mining Bureau are the following:

Gold and silver specimens from South America—J. Z. Davis.

Carbon (anthracite coal) in quartz, Amador county, Cal.

Quartz crystals of peculiar character, from near Calistoga, Napa county, Cal.—B. Tucker.

Cinnabar, Lake county, Cal.—Dr. Channing H. Cook.

Gold quartz, Porto Fino and Montgomery mines, Cherokee, Tuolumne county, Cal.—Dr. F. Drake.

Opalized wood and amygdaloidal basalt, from Sonoma county, Cal.—J. P. Stanley.

Tin ores, crystalized tin, etc., Temescal tin mine, San Bernardino county, Cal.—E. W. Jones.

Galena crystals in fossil oyster shell—J. Z. Davis.

Gold in hematite, Our Flag mine, Calaveras county, Cal.—T. H. McArdle.

Gold quartz, from a number of mines in Siskiyou county, Cal.

Placer gold—R. H. Campbell Company.

Tantalite, Fresno county, Cal.—Edw. Hooper.

Cinnabar and metacinnaharite, Abbott mine, Lake county, Cal.—J. A. Veatch.

Lava specimens from Kileaua, Hawaii—H. C. Adams.

Boleite, Lower Cal.—Compañia del Boleo.

Awaruite, Josephine county, Oregon—J. A. Scott and Judge W. K. Hanna.

Copper ores, suite from the mines of Boleo, Lower Cal.—Compañia del Boleo.

Stibuite, large specimens from Kern county, Cal.—Sumner & Brown.

Placer gold, Canyon creek, Trinity county, Cal.—C. Dannenbrink.

Several varieties of new and interesting rocks from California localities.

Large and fine specimens of fossil corals from San Diego county, Cal.

Auriferous blue gravel showing gold, from the channel east of Yreka, Siskiyou county, Cal.

Two Indian stone mortars, one from 60 feet below the surface, presented by Jas. Blair, and one from 32 feet below the surface, presented by J. P. Odhert.

Ashestos, Iowa Hill, Placer county, Cal.—H. G. Staah.

Opalized wood, Cow creek, Shasta county, Cal.—J. W. Conant.

Series of interesting carboniferous fossils, from near Stillwater, Shasta county, Cal., collected by H. W. Fairbanks.

Irrigation.

The question whether it pays to irrigate our lands has passed beyond the experimental stage, and it is admitted that it is the only system of husbandry that will pay. Mammoth enterprises have been inaugurated to bring water from our mountain streams to the great inland valleys for irrigating large tracts. Until a general system of irrigation has been completed, our vegetable gardens, vineyards, orchards and upland must use the pump for raising water, with either the windmill or the gas or gasoline engine for cheap motor-power. This demand has engaged the attention of our best mechanics and inventors to build a pump that would be durable and effective in raising large quantities of water.

The San Francisco Tool Company has made special effort in this line of mechanism, and their great plant at 55 Stevenson street makes more irrigation pumps than any house on the Pacific coast.

The Torrent Centrifugal pumps are the best known, and in more general use than any centrifugal pump in this State.

Any one who wishes to be enlightened on the subject of irrigating, draining or handling of water for domestic use or for stock will obtain valuable information by sending to the San Francisco Tool Company, 55 Stevenson street, for an illustrated catalogue.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Nov. 3, 1892.

General trade the past week was only fair. The general belief is that the election interferes with the distribution of goods and stocking up. While this may be the case, yet the general situation does not warrant taking such a view. This is shown in merchants' bank accounts. With very few exceptions, merchants are depositing more money than they are withdrawing. Their increased deposits indicate that the spirit of conservatism continues to dominate both here and in the interior. We dare say that never in the history of the State have merchants stood in such a strong financial position, yet this is not accepted favorably, for it indicates a want of confidence. Times are never so lively and prosperity more general than when money is active and merchants borrowers rather than hoarders; and it is the lack of this which evidently is against a generous trade and more activity in all branches of business.

Eastern mail advices report a growing feeling of confidence and an enlarging trade. The various manufacturing industries report continued activity with, in nearly all, orders ahead. This satisfactory condition has not obtained for several years, and is cause for congratulation and augurs well for the future, coming as it does during a presidential and many State elections. The advance in the price of cotton allowed free selling of that product in the southern States, which has made free collections possible in those States. The very heavy cereal crop in 1891 in the central States are being more favorably felt in both trade and finance. The very heavy movements (October 15th, 100,000,000 bushels of wheat, against 85,000,000 at like time in 1891) in cereals at the eight primary markets in the central States are having the effect of vitalizing railroad securities and drawing European operators into the speculative arena. With these securities active and stronger, it is only a question of a short time before other speculative securities and commodities are favorably influenced. Money at the East is quite active, with better rates of interest ruling.

European mail advices report a more active and stronger growing money market with the rates of interest appreciative. This activity has a favorable influence on general trade and speculation. That usually well-informed and reported rather conservative house of A. R. Cbisholm & Co. of New York, writing on the European outlook, says: "Speculation on the Bourse in Paris promises to be very lively this winter. Paris journals at hand dwell on the plans of leading banking-houses (which, differing from our conservative mode of banking, are very speculative in their movements) in converting the stocks of many industrial companies into certificates paying lower dividends, and of negotiating large conversion schemes from Brazil, Austria, Russia and other countries. The Parisian bankers are confident that a renewed speculation will set in on account of the great plethora of idle capital consequent on the Baring liquidation. The Frenchmen are inclined to invest in American industrials, as in case of a liquidation they will have a home market for them, as well as a Paris and London market. The great point in favor of our securities is that London sees they can be returned and drawn against here at home in case of liquidation. The Baring panic caused the sending back to this country of hundreds of millions of securities, and London now finds her piles of stagnant money earning no incomes or interest."

The International Monetary conference continues to absorb attention at home and abroad. Washington advices to October 29th report that it has been definitely decided that the United States delegates to the International Monetary Conference will sail by the steamer City of New York on Wednesday, November 9th. Representative McCreary, of Kentucky, will not be able, on account of urgent business, to go with the party, but he will follow as soon after as possible. The delegates are: Ex-Comptroller H. W. Cannon, president of the Chase National Bank; Senator Wm. B. Allison, of Iowa; Senator John B. Jones, of Nevada; Representative McCreary, of Kentucky; E. Benjamin Andrews, president of Brown University of Providence, R. I., and Edward O. Leech, Director of the Mint. The last named gentleman is ex-officio a delegate. Professor Andrews was appointed a delegate by the president in place of President F. A. Walker, who was compelled to decline the appointment. Before they sail the delegates will go on to Washington for the purpose of consulting with the President, the Secretary of State and the Secretary of the Treasury with regard to their duties and powers before the congress. After reaching Liverpool the party will proceed immediately to Brussels, where the conference will hold its opening session on November 22. The delegates from this country could not probably have been better selected, and will, no doubt, present data for the consideration of

the conference which should have great weight.

The antisilver press of London, headed by the *Economist*, appears to be taking alarm, and thinks the English Government has gone too far toward bimetallism. This fear is evidently heightened by the appointing of a Rothschild as a delegate, for it is well established that this great financial house favors bimetallism. From other sources of information, there can be no doubt but bimetallism has made great strides, not only in England, but also in Germany. The changing opinion in England is reflected by the Right Honorable Arthur J. Balfour, as reported by telegraph, in his speech, Oct. 27th, to Manchester merchants and bankers in support of the resolution that the most effective remedy of the present disastrous fluctuations in the relations of gold and silver would be an international agreement for the unrestricted coinage of both metals. Mr. Balfour said that he believed the stage which had been reached in the monetary troubles, caused by the appreciation of gold currency, was fraught with evils to every class of people in the British Empire. The currency of Great Britain bore no stable relation to the currency of other nations, and constantly was a chronic hindrance in the way of British export trade. The solution of the present difficulties had been given by the bimetallists. This solution was not only practicable, but also adequate. For a great commercial country a sound instrument of exchange was a matter of first necessity. Such an instrument would be found in a bimetallic currency. This instrument might have its imperfections, but it was better than any other yet devised. Mr. Balfour's declaration of his complete surrender to the bimetallists was received with enthusiasm and some surprise.

SILVER—The market held to fairly firm prices up to to-day, when London came through at 38 15-16d. This decline is a source of surprise to many, but to those who watch the movements of the markets at home and abroad it does not occasion any surprise. They appear to see in it the earmarks of the bears who are discounting the probable action of Congress on the present silver, without taking into due consideration the probable action of the Monetary Conference. Our eastern exchanges, and which is concurred in by leading financiers, are discussing the repeal of the present silver bill, and as this is gaining in favor, probably to it is largely due the low and unsatisfactory market for silver. It may be that short sellers will go one step too far and be made to pay for venturing.

MEXICAN DOLLARS—The market has held steady at around 68¼ cts.

QUICKSILVER—Receipts the past week aggregate 541 flasks. There has continued, for the season of the year, a fair home demand. The market has held firm.

LIME—Receipts the past week aggregate 3754 hbls. The market has been only fairly active. The export demand for the Hawaiian Islands has been quiet. The market is quoted at from $1.25 to $1.50 per hbl.

PIG LEAD.—The market has ruled fairly steady. The demand as is usual at this season of the year is slack. Eastern mail advices report a tone market with round parcels for future delivery very weak.

TIN.—Imports the past week aggregate 657 pigs from Australia. The market for pig is quiet, but apparently firm, while for plate it is quiet and rather in buyers favor. New York mail advices report pig as follows: While the consumption is on a quite large scale and sufficient to have some force, prices are still moved about at the will of the leading manipulators. The available supply for this market is figured out as being larger than usual during the latter part of October, but the statistical position is still practically without weight as a guide to values here or in the European markets.

PIG IRON—Imports the past week aggregate 100 tons from Newcastle, England. The local market, while essentially unchanged, appears to have a hardening tendency in sympathy with the East and England. The consumption is about as heretofore reported. *Iron Age*, Oct. 27th, reports the New York market as follows: Under the leadership of the southern furnaces, the market for ordinary foundry and forge pig is firmer, with the chances considerably greater for an advance than for a decline. Some of the large companies have marked prices up an additional 25c, but there is still iron enough to go around at the price established by the first advance.

COPPER—The market has ruled fairly steady throughout the week. Eastern mail advices report a heavy consumption, but there was no scarcity in the supply, which caused a barely steady market.

COAL—Imports the past week aggregate as follows: Newcastle (N. S. W.) 13 002 tons, Grangeworth 2463, Sydney 3048, Newcastle (England) 1483, Hull 265, Tacoma 2100, Baltimore 1808, Bellingham Bay 1500, Departure Bay 5475, Nanaimo 9207, Seattle 1387; total, 41,738 tons. The market is reported strong at essentially unchanged quotations. The yards are reported only moderately stocked. The tonnage on the way from Australia is quite small. Importers before venturing much on future shipments will probably wait until the character of the winter is more fully determined. With favorable crop weather, ships to this port will be low, but if the weather should be unfavorable, then ships will rule higher.

Eastern Metal Markets.

NEW YORK, Oct. 26.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39 1-18	84¾	11 65	3 80	20 50
Friday	39 1-16	84⅞	11 85	3 80	20 50
Saturday	39 1-16	85	11 65	3 80	20 50
Monday	39¼	85¼	11 65	3 80	20 50
Tuesday	39¼	85¼	11 65	3 80	20 60
Wednesday	39¼	85¼	11 65	3 80	20 60

Quicksilver is firm. Lead and tin are barely steady. Copper is quiet but firm. Pig iron is fairly active. Borax is in fair demand at unchanged quotations.

Mining Share Market.

SAN FRANCISCO, Nov. 3, 1892.

There was no characterizing feature, the past week, to the share market. It has acted very much as if the mill rings and share pools were dragging for the last obtainable share, preparatory to an expected demand from outsiders for shares in the near future. This demand, it now looks like, will be instigated by the knowledge that reforms have been, and are being made in working the mines and in milling the ore by which the rings will not get so large a proportion, if any of the bullion produced. The reforms which have already been made, have been done very quietly, and in such a way as not to attract undue attention. Car samples and also pulp assays of ore are now being given by several of the mines, as also are the number of tons raised and the number milled. The monthly statements are being filed more complete, with more details, which admit of a much better understanding by outsiders, of the situation. These reforms the MINING AND SCIENTIFIC PRESS has been contending for in the interest of outside shareholders and also for the good of the mining industry of the coast. While the rings can go a step farther and have the companies own or lease the mills, so there will not be the least occasion for suspicion of collusion, yet the reforms already instituted are calculated to promote a spirit of investment in lieu of that of gambling in the interest of mill rings, as it appears to have been run. Moneyed men, as it now looks, can invest in shares with a seeming assurance that they will get their proportion of bullion produced, owing to the old game of bullion for insiders and assessments for outsiders, seemingly being relegated to the past.

Probably never before was there a more auspicious time for promoting a mining boom on this coast, by instilling new life into mining shares and running the mines listed on the two exchanges in the interest of *all* shareholders. For all of three years the public on this coast, at the East and also abroad has pursued a conservative and money-saving policy, with the result that the large majority has put money away, and with money in hand it is only human nature to make investments when the opportunity is largely in favor of quick turns and good profits, with a fair degree of certainty that even if prices should go down, they stand a reasonable degree of certainty to get more or less of their money back in dividends. Besides the above, it now looks as if the International Monetary Conference will act more favorable to bimetalism, by which the rehabilitation of silver will be assured in the near future, and this very course, if adopted, is calculated to bring about confidence in all countries which will inspire a spirit of speculation and more prosperous times. Already there is a growing feeling of confidence abroad and also at the East, and as this gains in strength, speculative commodities and securities are more in favor, which is creating a hardening in their market value. This is noted from week to week in our "Financial and Market Review" in another column, to which dealers in mining shares can refer.

The market opened this (Thursday) morning inactive, but fairly strong. After regular call prices shaded off under light business. The attendance at the two boards and around the tickers was smaller than ever, which goes to prove that the public is taking but little interest in the market. The impression prevails among those who are usually well-informed that before there is much of an advance prices will have to go still lower, and when they do go some lower shares in the leading mines would be a buy for something "big." While knowing nothing about the manipulations or how low prices will go, yet the market acts as if it is working into a position for a deal.

Reports are current that several assessments will be levied in this month.

News from the Comstock mines is to the effect that they expect (provided the mining share market is in proper shape) to soon strike on the 400-foot level the downward continuation of the rich ore found on the 300-foot level. They will run for the ore on the 500-foot level if they are successful on the 400-foot. This, of course, means time and money. They are running the lateral drift toward Crown Point. Ore sent the last week from the latter mine pulped over $25 per ton. Challenge and Con Imperial Mining Companies report sending ore to the mill, but do not give the quantity or assay value, which is contrary to law. Important prospecting work is under way in Yellow Jacket, but as there is a large force of men at work it looks as if another assessment is to be levied, probably toward the end of this month. The work in Ophir is being closely watched by mining men. They claim that while the work warrants the belief of an important development, yet it can be turned so as to amount to virtually nothing. This they believe is the more likely to be the case, for both Flood and Mackay are away. Con Virginia is working out of debt, as is Potosi. In the middle mines and also in Sierra Nevada active work is said to be under way.

The market closed to-day weak and inactive. There is no doubt that brokers hold very few shares, which forces the conviction that much higher prices will rule before the month is past.

485,118.—POTATO-DIGGER—S. N. Washburn, Little Falls, Wash.

The following brief list by telegraph, for Nov. 1, will appear more complete on receipt of mail advices:

Daniel Best, San Leandro, carburetor; James A. Cain, Markham, Cal., box-nailer; Edwin Densmore, Coronado, surgical splint; John Gambetta, Stockton, axle-nut; Myron B Gibson, Ice velocipede; John Hatch, San Francisco, dredging implement; Daniel K. Howe, Prineland Or., fishing fly book; Cornelius W. Huson, Nevada City, Cal., waterwheel; Ernest A. Langford, Grass Valley, Cal., ore-feeder; George Morr, Lafayette, Or., gopher-trap; John Z. Nyquist, Tacoma, Wash., journal box; John B. Pitchford, San Francisco, waterwheel bucket; Thomas E. Pope, Oakland, railway car; Ernest L. Ransome, concrete mixing machine; William M. Rice, Los Angeles, faucet; Phillip T. Taylor, San Francisco, cable railway grip; William A. Fyfson, San Francisco, pipe-making machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR CUFF-BUTTON.—Julius A. Bidwell, Pomona. No. 21,902. Dated Oct. 18, 1892. The design may be said to consist in a circular figure, apparently embossed concentrically upon a second underlying circular figure, the one overlying the other. The dollar sign ($) is represented upon the smaller overlying circular figure.

RANGE-FINDER.—Charles M. Allen, S. F. No. 484,726. Dated Oct. 18, 1892. This apparatus, which the inventor calls a "range-finder," consists of a camera obscura with perspective scales, plotting-chart and trajectory-scale, whereby the distance of points over level or other surfaces may be accurately determined.

COPYING PRESS.— Edgar F. Verrill, S. F. No. 484,748. Dated Oct. 18, 1892. The invention relates to that class of copying presses in which rollers are employed. It consists in the novel arrangement of the rollers, both those for copying and those for feeding, a novel adjustable moistening roller adapted to be thrown into and out of contact with the copying paper at will and the means for operating this roller, a novel water supply roller for acting on the moistening-roller, and other details of construction and arrangement.

TILE.—Robert F. Hunn, Vallejo. No. 484,741. Dated Oct. 18, 1892. The invention relates to the art of covering surfaces with tiles which, owing to their construction and the method of laying them, can be made so thin that the term "veneering" can be properly applied. The object of the invention is to provide a tile which, on account of its construction, can be rapidly and securely laid to cover any surface, such as the outsides of buildings, mantel-pieces and the interior of vestibules, and all surfaces to be covered, said tile being inexpensive and serviceable. The use of these tiles will avoid the labor involved in laying the ordinary thick tiles in mortar or cement.

HARROW AND CULTIVATOR.—T. J. Hubbell, San Bernardino, assignor of one-third to Geo. H. Smith. No. 484,739. Dated Oct. 18, 1892. This implement for preparing and cultivating the ground consists of a hinged-separable-frame with hearing and steering-wheels, adjusting levers, etc. The machine may be used either as a harrow or a cultivator.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST BORAX COMpany. San Francisco, Oct 31, 1892 At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 23) of One Dollar ($1.00) per share was declared, payable THURSDAY, November 10, 1892, at the office of the company, No. 101 Sansome Street, Room 28. Transfer books will close November 6, 1892, at 3 o'clock, P. M.

Foundry Notes.

The cruiser Olympia, launched from the shipyards of the Union Iron Works on Saturday last, is the largest war-ship ever built on this coast. The vessel is of the protected cruiser type, exceeding others of her class in size in this country. Of course much still remains to be done on the ship, but she will be finished while in the water alongside the docks. The principal dimensions of the Olympia are: Length on water-line, 340 feet; extreme beam, 53 feet; displacement, 5750 tons; indicated horsepower, 13,500; guaranteed speed on trial, 20 knots; coal capacity, 1300 tons; radius of action at 10 knots, 13,000 miles.

As a matter of comparison, it may be stated that the Charleston's radius of action is only 7477 miles and the San Francisco's 8333 miles.

The Olympia has two masts, with two tops on each. Her sailpower is sufficient to steady her in a seaway. Freeboard forward, 18 feet; aft, 17 feet. Her battery consists of four 8-inch breech-loading rifles, ten 5-inch rapid-firing guns, four 6-pounder rapid-firing guns, eight 1-pounder rapid-firing guns and six torpedo tubes. There are two fixed torpedo tubes, one in the bow and one in the stern, and two training tubes on each broadside. Eighteen-inch Whitehead torpedoes are used. The vessel has a double bottom, and contains about 150 water-tight compartments, besides a number of water-tight doors in bulkheads on the several decks and below the protective deck. A protective belt 2 feet 9 inches wide, filled with cellulose, extends the whole length of the vessel on both sides just above the protective deck. This cellulose is manufactured from the fiber of the cocoanut and when compressed makes a perfect water-excluding material. A passage separates this belt from the coal bunkers, which form another means of protection, particularly to the engines and boilers.

This last vessel built by the Union Iron Works will cost when completed $1,800,000. There are several novel features in the design and equipment. The requirements of speed and engine trial will doubtless be met satisfactorily, as the best work possible has been done by the builders.

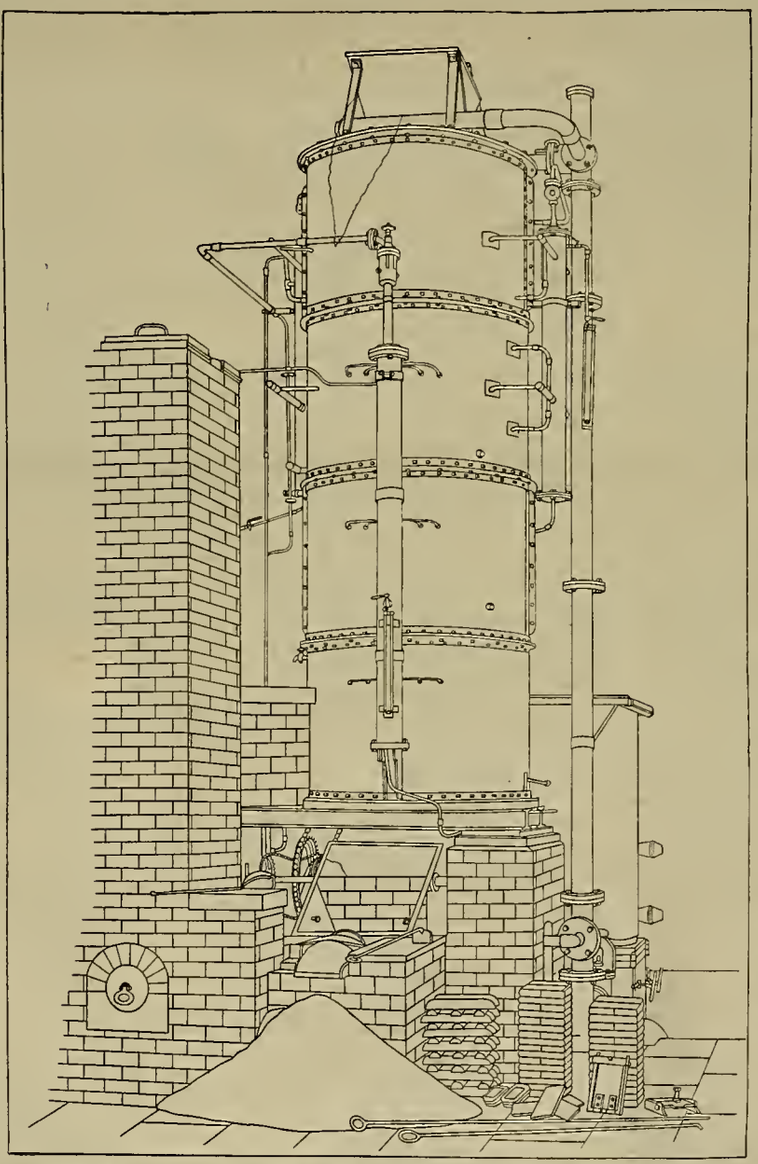
The Atlas Iron Works, at the Potrero, were almost entirely destroyed by fire on Monday. The machine-shop and pattern-shop, with a number of valuable patterns, were consumed, but the axle works, in a separate building, escaped, as did the foundry in the rear. The loss is between $50,000 and $60,000, with $40,000 insurance. The works will be rebuilt at once. The Atlas Iron Works were formerly owned by J. B. Jardine, who moved them to the Potrero about three years ago. Some months since, he was bought out by a company, of which P. Noble is president and J. T. McCrossan is secretary.

MORE miners are going into Ferguson district, Lincoln county, than the times justify, and the *Lode* advises those seeking employment to stay away for the present.

THE Needles Reduction Co. has let a contract to Michigan men to put up smelters valued at $100,000. The plant is to have a capacity of 200 tons a day, and the pyritic process of smelting will be the treatment employed. The contract calls for the completion by March 1st. The works will be built on the Colorado river and on the line of the Atlantic & Pacific railroad.

C. P. HUNTINGTON, president of the Southern Pacific Co. has purchased the Iron Mountain mine near Durango, Mexico. This is a very famous deposit and it is Mr. Huntington's intention to thoroughly open and utilize it. The mountain was owned by a syndicate of Scotch, English and French capitalists, and has been worked in a desultory way or centuries.

MANY Americans are investing in the mines of West Kootenay, B. C., especially in Lardeau and Fish Creek districts.



SHEDLOCK'S APPARATUS FOR THE TREATMENT OF REFRACTORY ORES.

Shedlock's Process for Refractory Ores.

In treating ore by this process, the rock is crushed in the usual way, either by rolls or stamps, the crushed ore being conveyed into an apparatus where each atom is subjected to the action of gases under pressure, whereby the whole of the sulphur and other materials which render the ore refractory are separated. The ore is then conveyed into a vessel containing an absorbing fluid metal, so constructed that every particle of the ore is brought into contact with the metal. For the production of the reducing gases steam and air are passed through highly-heated materials having an affinity for oxygen, and the gases so produced are utilized for raising the ore to a high temperature. By this means the sulphur and other metalloids and base metals are volatilized and eliminated, and the gold in the ore is then in such a condition as to alloy itself or become amalgated with the fluid metal with which it is brought into close contact; the tailings, passing off worthless, are conveyed to the dump.

The apparatus by means of which this process is conducted will be found illustrated herewith. The apparatus in the background is that in which the steam is generated, and which, in combination with the due proportion of atmospheric air, is first superheated in passing through the hearth or bed on which the fire is supported. The superheated steam and air under pressure are then forced through the fire, which is automatically maintained at a considerable depth, by which means the products of combustion are mainly hydrogen and carbonic oxide. These gases are then conveyed by means of the main and branch pipes to the cylindrical apparatus in the foreground, into which the ore to be acted upon is driven under pressure by means of the gases, which, being ignited, raise the ore to a high temperature. The ore is maintained in a state of violent agitation; each particle, being kept separate from its fellows, is consequently very rapidly acted upon by the gases. The ore freed from its refractory constituents is then fed into a vessel containing the fluid metal, in which each particle of ore is separated from the others, and, being acted upon by the fluid metal, is absorbed into it, the tailings and refuse passing off, freed from any gold which may have been in the ore. Quantities of refractory ores treated by this process are said to have demonstrated that most of the gold in the ore is extracted. The successful outcome of these trials is stated to have resulted in the Anglo-French Exploration Company acquiring the right to work the process on the various goldfields of South Africa.

It will have been seen that the peculiar and essential features of the invention consist in subjecting every particle of the ore under treatment to the process in all its stages instead of in bulk, thereby insuring that no portion shall escape being acted upon by the gases and the absorbing metal. This is done automatically and in a very rapid manner. It is stated that this method of treatment is applicable to all ores.

Comment.

The annual convention of the State Miners' Association will take place in this city on Tuesday next, probably at Pioneer Hall. The different county miners' associations are entitled to one delegate for each ten members, and 400 or 500 representative mining men are expected. The largest delegation will be from the Nevada County Miners' Association, which has a membership of upward of 1200. It is not expected that there will be as many present as on the occasion of the first miners' convention in January last when the State Association was organized. This year counties having no miners' associations have been invited to send ten representatives, but those at a great distance will not be apt to send so many. On the former occasion, Pioneer Hall was found to be not large enough and the convention adjourned to Metropolitan Temple, but the county proportion of delegates is smaller this year.

The convention of this month will not be so easy to "handle" as that which organized the miner's movement. At that time no one knew exactly what was to be done and as soon as anything was proposed it went through. On this occasion the status of the miners is better understood and there is apt to be more difference of opinion as to what will be best for the mining industry. This will lead to more debate and raise discussion of the resolutions, etc., offered. At the different meetings in the county associations, many questions have been debated which may come up before the convention, and the members have opinions of their own which they will now offer.

The principal matters to be discussed by the hydraulic miners at the convention will be the recent decisions of Judge Gilbert relative to impounding dams and the Caminetti bill with the proposed amendments of Senator Felton. This bill, with proposed amendments, is published in full in this number of the PRESS, and should be read carefully by all the delegates so that they may have a thorough understanding of it. The practical ideas of the miners of the convention should be so expressed as to aid the legislators who have the measure in hand. Doubtless a committee will be appointed to consider the details of the bill. Possibly some of the amendments proposed by Senator Felton may not suit the ideas of the miners themselves. At all events, a thorough discussion of the measure should bring out ideas of value. As the House has already passed the bill, and it will be considered by the Senate next month, the opinions of the miners most interested should be expressed, more particularly as to the proposed amendments.

At the first convention almost the entire time of the delegates was absorbed in the hydraulic-mining question, that being considered of most importance. Great good was accomplished for that interest and the attention of Congress called to it, resulting, finally, in the passage by the House of the bill pending in the Senate. Public attention, too, was aroused to the bad condition of this branch of the gold-mining industry of the State, and a distinctly friendly feeling for the miners became manifest. The quartz and drift miners, however, had some little matters affecting them, but which there was no time to consider. As these miners are much more numerous than those engaged in hydraulicking, they will be apt this time to demand more attention. This can properly be given, since the hydraulic-mining question is now in a fair way of settlement, and that industry, by reason of recent decisions, is on a better basis than for ten years past.

Practically putting the burden of proof upon the mineral claimant, in contests between agricultural and mineral claimants before the Land Offices, and permitting agricultural claimants to take up land notoriously mineral in character, are two abuses needing reform. By the latter system, vast tracts of land have been alienated from the mineral domain and lost to the prospector forever. The Government never intended this, and it is an abuse which has grown up under "regulations" of the Land Office, to which the attention of Congress should be called. Requiring a "paying" mine to be found before a title can be obtained, is another evil, for in many cases a claim must be worked several years before it can be made to pay. Then there is the vexed question of mineral on railroad grants, which is bound to come before this convention, although it was ignored by the last one. The subject was brought before one of the committees, but was pocketed for fear of discussion. It is a live question, however, and one which should be ventilated. The railroad companies in this and other States have illegally absorbed large tracts of land, compelling the prospector to buy from them instead of the Government. This is another thing never intended by Congress, and is an evil demanding an immediate remedy. It is even late now, for the mineral land which has already passed to the railroads can scarcely be regained by the public. This is another feature restricting the domain of the prospector and injuring the mining industry of the country.

As to drift-mining—a peculiar branch of gold-mining incident to the geological features of California—those engaged in it are subjected to unusual hardships by the stupidity and ignorance of the Department of the Government charged with granting title to mineral lands. The rulings of this department with regard to drift-mining are absurd in the extreme, but they stand as law—Department-made laws—until the courts or Congress set them aside. Under these rulings, they must, before obtaining patent to the ground, prove the existence of paying mineral, which is under the lava cap, buried hundreds of feet. Tunnels thousands of feet long have to be run to reach the channels, yet the departments require the gold to be found before conveying title. Of course men do not care to expend money on property not their own. These features have been explained time and again, but the department still maintains its position. The drift miners want Congress to officially recognize drift-mining by proper legislation which will give them title to their ground before they begin to spend money on it.

These and other questions will be considered by the miners' convention. They are all of importance to the mining industry. We shall next week give a full report of the proceedings of the convention, so that miners throughout the State who cannot attend may learn of the proceedings.

Water-Power for Mining in Nevada County.

The prices charged for water for power at the mines of Grass Valley and Nevada City are not quite so high as stated by our correspondent in his letter last week. The water rates of the South Yuba Water Co. for power to the quartz mines is, we are informed by the superintendent of the Nevada Division, 18 cents per miners' inch for 24 hours.

In the case of the Idaho mine, water is used under 550-feet pressure, which gives 1.33 horsepower per inch of water, making the cost 14 cents per day for each horsepower. The Empire and North Star mines both use the same water, it being first used at the first mine and then at the second, under a combined pressure of 690 feet, which gives 1.67 horsepower per inch of water and makes the cost less than 11 cents per horsepower for each day of 24 hours. Other mines use water under pressures of 300 to 400 feet, making cost of power range from 18 to 24 cents per day for each horsepower.

There is only one dividend-paying mine at the present time in that vicinity using steampower, which is the W. Y. C. D. of Grass Valley, and which costs them 46 cents per day for each horsepower.

The South Yuba Water Company's canal system was constructed many years ago to furnish water for hydraulic mining for that section of Nevada county situated between the South Yuba river and Bear river. After injunctions had been issued by the courts stopping hydraulic mining, the canals were extended for the purpose of furnishing power for quartz mining in the vicinity of Nevada City and Grass Valley. Up to that time the quartz mines were all run by steampower, which cost from 50 to 75 cents for 24 hours for horsepower.

Mining in the vicinity of Grass Valley received a new impetus, and this section of country entered on an era of prosperity unequaled in its history before, owing to the cheapness and efficiency of waterpower in place of steam.

The South Yuba Company's main canal heads on the South Yuba river near Emigrant Gap, the river furnishing natural water for six months in the year, to the full capacity of the canal of 7500 inches. For the remaining portion of the year the supply of water is kept up from storage reservoirs in the mountains. The main canal conveys the water to the head of Deer creek, where it is dumped, and taken out by canals lower down, and conveyed to the vicinity of Nevada City and Grass Valley. This creek, during the winter months, furnishes a large supply of water, and the main supply from the South Yuba river, since the stopping of hydraulic mining, is only used during the summer months.

During the past ten years, since the company has been furnishing power for quartz-mining, the water has been kept continuously running, without material interruption, except during the winter of 1888 and 1889, when five feet of snow fell in Nevada City, the railroads were all blockaded, all business except snow-shoveling came to a standstill, and even provisions were scarce in Nevada City and Grass Valley.

The company have at different points distributing reservoirs, holding several days' water, which permit the canals to be kept in order and repairs made. Nearly three years ago the company purchased the Birdsall system of canals in Placer county and have kept the same fully supplied with water, the storage system in the mountains being ample to supply both the Nevada and Placer county canals.

In addition they are just completing a new stone dam 67 feet high, near the head of their main canal on the South Yuba river, which will make a reservoir with a holding capacity of 125,000 miners' inches of water. Near Gold Run the company are at work extending their Dutch Flat canal toward Colfax, for the purpose of turning clear water into the Placer county system to take the place of the muddy water now in Bear river, and to supply a section of country now without water facilities.

At different places on the system of canals are falls or drops which can be utilized for power, the water allowed to run on and afterward used over again for power at other places, and finally used for irrigation or domestic purposes. By means of electrical transmission this power will in time be used, and the company are preparing to make use of it as soon as circumstances warrant the expenditure. It is estimated that in this manner they can furnish at different places upward of 50,000 horsepower from its present water-supply, which could be augmented by the construction of additional storage reservoirs in the mountains, the sites of which are now owned by the company.

At the Risdon Iron Works.

The Risdon Iron Works of this city are about to commence the manufacture of a machine for taking care of debris from the working of gravel mines and capable of handling 10,000 yards a day. It first screens out the cobbles and then takes care of the sand, etc., which can be conveyed to any desired place and dumped, by cars or conveyors. The water can be saved and pumped back. They have at the works a working model, made on a scale of one inch to the foot. Those who want to handle gravel without letting the debris run into the streams should examine this model.

These works have also built half a dozen of their cement gravel machines, and a new order has just been filled. This machine breaks up the cement and cleans the cobbles, not crushing them, leaving the free gold in the bottom to be collected without the use of quicksilver.

As stated, the cement is crushed and gold set free, but the cobbles are simply cleaned and not broken. The machines of this type already built are giving satisfaction.

The Risdon shops are also busy on Bryan roller-mills and filling extensive orders for Mexico, part of the machinery being built in sections for transportation on mule-back into the mountains. This mill is meeting with great favor, as it is a very good amalgamator and cheap to transport and erect. Many people believe that the Bryan mill is on some new principle, as it has not been many years on the market. The makers do not claim anything new in the process or mode of operating. It is simply a mechanical improvement on the old Chile mill, which is in itself a development of the original arrastre. The idea is as old as that of stamps for crushing ore. But by improving the details of construction and operation, in accordance with modern mechanical knowledge, a more perfect machine is developed. It is under better control and, what is of great importance, affords greater capacity, doing much more work than the ordinary, crude Chile mill. The Bryan mill has met with much favor wherever it has been introduced, and the sales of the machine are increasing.

THE State Miners' Association will assemble at 10 A. M. Tuesday, Nov. 15th, probably at Pioneer Hall, in Pioneer Building, Fourth street near Market.

Coast Industrial Notes.

GENERAL MANAGER WADE of the Santa Fe brought from Chicago a few days ago the plans for the First street depot in Los Angeles. The plans have been approved by the eastern management. The work of construction will be commenced at once. The new depot will be 300 feet long. The architecture will be of the Elizabethan style and the structure composed of pressed brick, with terra cotta trimmings. The central portion, opposite Second street, will be two stories high, while the two wings, extending on either side, will be one story.

IT is pretty generally known that a party of surveyors has been locating the route for a railroad from Truckee to Tahoe. The line proposed will start from the sawmill of the Truckee Lumber Co., pass through Martis creek, and leaving Richardson's mill to the right, cross the Tahoe divide near the crossing of the present wagon road to Carnelian Springs. There are no serious grades to encounter and the greatest part of the route is through a magnificent belt of pine. The surveyors have completed their work and are well satisfied with the result of their labors. The construction of the road would be a good thing for Truckee.

THE cannery prospects of Alaska are more favorable this year than last. For the past three years the market has been overstocked and 350,000 cases were left unsold at the commencement of this year. As a consequence 36 companies consolidated into 14, of which 9 are in a combine and 5 working separately. The combine restricted their pack this year to 400,000 cases and outsiders cut down to 120 000 cases. The whole 520,000 cases have been disposed of already, together with 75 per cent of the 350,000 left over last year. The balance will soon be disposed of and the canners hope to start next April on a clear market on which they hope to place 700,000 cases of salmon.

THE Olympic Salt Water Company has received its first installment of 25 per cent of the iron pipe which is to furnish sea water for this city from the ocean, and it is now laid out along Post street from the new Olympic Club building to Van Ness avenue. The pipe has been much delayed by a process of painting with paraffine, as the wax had to be imported from the East. The directors of the company expect to have the pipe laid very rapidly now that a start has been made, and hope to be pouring the salt water into the city early next year. The scheme is to establish a large pumping station near the Cliff House and erect engines capable of hoisting 3,000,000 gallons of water every 24 hours to a large reservoir near 43d and Point Lobos avenues, which is nearly 300 feet above the city base level. The pipes will be 12, 14 and 16 inches in diameter, made of cast iron and coated with asphaltum and paraffine. A system of mains and division pipes will be run all over the city, terminating at the foot of Third street, where the water will discharge into the bay. If the water be not used the whole 3,000,000 gallons must pass through the sewers to flush them every day. The water will be used for a large number of baths and tanks all over town.

Personal.

H. G. ADAMS has been engaged by the Flores Mining Co., Arizona, to run its mill.

H. W. HITCHCOCK is now superintendent for the new mining company at White Hills, A. T.

SUPT. W. B. GILLINGHAM of the Phœnix mine, A. T., has made a first-rate strike of rich ore in the mine.

MR. JAMES, of Los Angeles, is superintendent of the Frazer mine, 65 miles north of Ventura, in Ventura county.

CHAS. BALBACH, owner of the Washington mine, Willow creek, Idaho, will change the milling plant from dry to wet.

JOHN LITTLE has disposed of his interest in the Owl and Montana mines near Camphell, A. T., to the Flores Mining Co.

WORK at the Patterson hydraulic mines on Beaver creek, Oregon, was shut down last week for the winter, and Ad Graham and Cliff Payne returned to Ashland.

L. J. LEWIS, of Pentz, Butte county, has moved down to San Francisco for the winter, to recuperate from a hard year's work in opening the Durgin mine.

FRED FRANKS has bonded the Cornell and Deholder mines on White Pine mountain, Nev., it is said, in the interest of Montana capitalists. Messrs. Ross & Siri have also bonded their mine.

E. H. WILTSEE of Grass Valley has recently been examining some quartz properties at the head of Canyon creek, Trinity county. He returned to this city last week, but will shortly leave for the South African goldfields.

MESSRS. Frank Watson, J. C. Pomeroy, W. H. Webb and R. B. Cheeseman went down by land on the 27th ult. to inspect the recent purchase of the Oregon Iron and Steel Company at San Isidro, Lower California, and to plan further operations.

G. W. KIMBLE has charge of the railroad construction for the American River Co. A locomotive for the road has been shipped to Auburn, whence it will be taken to the track. Considerable work has been done on a dam in the river near the chute. About six miles of the road has been graded.

DR. HENRY LEIPMAN, prominently identified with the MacArthur-Forrest process, has arrived in Baker City, Oregon, from New York. Mr. Leipman, it will be remembered, was in Oregon about one year ago, representing the Gold and Silver Extraction, Mining and Milling Company, of Denver, and experimented with the Cyanide treatment at Cracker creek. The gentleman's visit at this time is to take charge of the North Pole Mining Co., which is now putting in a large reduction plant at Cracker creek, Mr. Alexander Baring contemplating a trip to Europe in the near future.

The Caminetti Bill and Proposed Amendments.

The Bill As It Passed the House, and the Amendments To Be Proposed In the Senate by Senator Felton.

[The following hill to create the California Debris Commission and regulate hydraulic mining in this State passed the House at the last session of Congress, went to the Senate, and was referred to the Committee of Mines and Mining of the latter body. Senator Felton inteuds to propose several amendments to the hill as passed hy the House. The copy here printed is the original hill, with the proposed amendments added. These amendments are indicated by SMALL CAP type, while the words printed in *italic* are to be displaced. For instance, in the fourth line of the third section the word *system* is to come out and the word SYSTEMS take its place. Again in the third line of section five the words *canyons and* are to come out altogether, and so on all through the bill. By noting these differences in the type as they occur, one may read the bill as it now stands, or as it will appear if the proposed amendments are adopted.—ED. PRESS.]

IN THE SENATE OF THE UNITED STATES.

JULY 19, 1892.

Read twice and referred to the Committee on Mines and Mining.

AUGUST 5, 1892.

Order to be reprinted with the amendments intended to be proposed by MR. FELTON, viz: Omit the parts in *italic* and insert the parts printed in SMALL CAPS.

An Act

To create the California Debris Commission and regulate hydraulic mining in the State of California.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a commission is hereby created, to be known as the California Debris Commission, consisting of three members. The President of the United States shall, by and with the advice and consent of the Senate, appoint the commission from officers of the Corps of Engineers, United States Army. Vacancies occurring therein shall be filled in like manner. It shall have the authority, and exercise the powers hereinafter set forth, under the supervision of the Chief of Engineers and the direction of the Secretary of War.

SEC. 2. That said commission shall organize within thirty days after its appointment by the selection of such officers as may be required in the performance of its duties, the same to be selected from the members thereof. The members of said commission shall receive no greater compensation than is now allowed by law to each, respectively, as an officer of said Corps of Engineers. It shall also adopt rules and regulations, not inconsistent with law, to govern its deliberations and prescribe the method of procedure under the provisions of this act.

SEC. 3. That the jurisdiction of said commission, in so far as the same affects mining carried on by the hydraulic process, shall extend to all such mining in that territory drained by the Sacramento and San Joaquin river *system* SYSTEMS. Hydraulic mining, as defined in section eight hereof, directly or indirectly injuring the navigability of said river systems carried on in said territory other than as permitted under the provisions of this act is hereby prohibited and declared unlawful.

SEC. 4. That it shall be the duty of said commission to mature and adopt such plan or plans, from examinations and surveys already made and from such additional examinations and surveys as it may deem necessary, as will improve the navigability of all the rivers comprising said systems, deepen their channels, and protect their banks. Such plan or plans shall be matured with a view of making the same effective as against the encroachment of and damage from debris resulting from mining operations, natural erosion, or other causes, with a view of restoring, as near as practicable and the necessities of commerce and navigation demand, the navigability of said rivers to the condition existing in eighteen hundred and sixty, and permitting mining by the hydraulic process, as the term is understood in said State, to be carried *on* PROVIDED THE SAME CAN BE ACCOMPLISHED without injury to the navigability of said rivers or the lands adjacent thereto.

SEC. 5. That it shall further examine, survey, and determine the utility and practicability, for the purposes hereinafter indicated, of storage sites in the *canyons and* tributaries of said rivers and in the respective branches of said tributaries, or in the plains, basins, sloughs, and tule and swamp lands adjacent to or along the course of said rivers, for the storage of debris or water or as settling reservoirs, with the object of using the same by either or all of these methods to aid in the improvement and protection of said navigable rivers by preventing deposits therein of debris resulting from mining operations, natural erosion, or other causes, or for affording relief thereto in flood time and providing sufficient water to maintain scouring force therein in the summer season; and in connection therewith to investigate such hydraulic and other mines as are now or may have been worked by methods intended to restrain the debris and material moved in operating such mines by impounding dams, settling reservoirs, or otherwise, and in general to make such study of and researches in the hydraulic mining industry as science, experience, and engineering skill may suggest as *practical* PRACTICABLE and useful in devising a method or methods whereby such mining may be carried on as aforesaid.

SEC. 6. That the said commission shall from time to time note the conditions of the navigable channels of said river systems, by cross-section surveys or otherwise, *and observe* IN ORDER TO ASCERTAIN the effect *thereon* THEREIN of such hydraulic mining operations as may be permitted by its orders AND SUCH AS ARE CAUSED BY EROSION, NATURAL OR OTHERWISE,

SEC. 7. That said commission shall submit to the Chief of Engineers, for the information of the Secretary of War, on or before the fifteenth day of November of each year, a report of its labors and transactions, with plans for the construction, completion, and preservation of the public works outlined in this act, together with estimates of the cost thereof, stating what amounts can be profitably expended thereon each year. The Secretary of War shall thereupon submit same to Congress on or before the meeting thereof.

SEC. 8. That for the purpose of this act "hydraulic mining" and "mining by the hydraulic process," are hereby declared to have the meaning and application given to said terms in said State.

SEC. 9. That the *owner or owners* INDIVIDUAL PROPRIETOR OR PROPRIETORS, or in the case of a corporation its manager or agent appointed for that purpose, owning mining ground in the territory in the State of California mentioned in section three hereof, which it is desired to work by the hydraulic process, *may* MUST file with said commission a verified petition, setting forth such facts as will comply with LAW AND the rules prescribed by said commission.

SEC. 10. That said petition shall be accompanied by an instrument duly executed and acknowledged, as required by the law of the said State, whereby the owner or owners of such mine or mines surrender to the United States the right and *privileges* PRIVILEGE to regulate by law, as provided in this act, or any law that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the working of said mine or mines shall be restrained, and what amount shall be produced therefrom; it being understood that the surrender aforesaid shall not be construed as in any way affecting the right of such owner or owners to operate said mine or mines by any other process or method now in use in said State: PROVIDED, THAT THEY SHALL NOT INTERFERE WITH THE NAVIGABILITY OF THE AFORESAID RIVERS.

SEC. 11. That the owners of several mining claims, situated so as to require a common dumping-ground or dam or other restraining works for the debris issuing therefrom in one or more sites, may file a joint petition setting forth such facts in addition to the requirements of section nine hereof; and where the owner of a hydraulic mine or owners of several such mines have and use common dumping sites for impounding debris or as settling reservoirs, which sites are located below the mine of an applicant not entitled to use same, such fact shall also be stated in said petition. Thereupon the same proceedings shall be had as provided for herein.

SEC. 12. A notice specifying briefly the contents of said petition, and fixing a time previous to which all proofs are to be submitted, shall be published by said commission in some newspaper or newspapers of general circulation in the communities interested in the matter set forth therein. If published in a daily paper, such publication shall continue for at least *five* TEN days; if in a weekly paper, in at least *two* THREE issues of the same. Pending publication thereof, said commission, or a committee thereof, shall examine the mine and premises described in such petition. On or before the time so fixed, all parties interested, either as petitioners or contestants, WHETHER MINERS OR AGRICULTURISTS, may file affidavits, plans and maps in support of their respective claims. Further hearings, upon notice to all parties of record, may be granted by the commission when necessary.

SEC. 13. That in case a majority of the members of said commission, within thirty days after the time so fixed, concur in a decision in favor of the petitioner or petitioners, the said commission shall thereupon make an order directing the methods and specifying in detail the manner in which operations shall proceed in such mine or mines; what restraining or impounding works, if facilities therefor can be found, shall be built and maintained; how and of what material; where to be located; and in general set forth such further requirements and safeguards as will protect the public interests and prevent injury to the said navigable rivers AND THE LANDS ADJACENT THERETO, with such further conditions and limitations as will observe all the provisions of this act in relation to the working thereof and the payment of taxes on the gross proceeds of the same: PROVIDED, That all expense incurred in complying with said order shall be borne by the owner or owners of such mine or mines.

SEC. 14. That such petitioner or petitioners must within reasonable time present plans and specifications of all works required to be built in pursuance of said order for examination, correction, and approval by said commission; and thereupon work may immediately commence thereon under the supervision of said commission or representative thereof attached thereto from said Corps of Engineers, who shall inspect same from time to time. Upon completion thereof, it found in every respect to meet the requirements of said order and said approved plans and specifications, permission shall thereupon be granted to the owner or owners of such mine or mines to commence mining operations, subject to the conditions of said order and the provisions of this act.

SEC. 15. That no permission granted to a mine owner or owners under this act shall take effect, so far as regards the working of a mine, until all impounding dams or other restraining works, if any are prescribed by the order granting such permission, have been completed and until the impounding dams or other restraining works or settling reservoirs provided by said commission have reached such a stage as, in the opinion of said commission, it is safe to use the same: PROVIDED, HOWEVER, That if said commission shall be of the opinion that the restraining and other works ALREADY constructed at the mine or mines shall be sufficient to protect the navigable rivers of said systems and the work of said commission, then the owner or owners of such mine or mines may be permitted to commence operations.

SEC. 16. That in case the joint petion referred to in section eleven hereof is *favorably acted upon* GRANTED, the commission shall fix the respective amounts to be paid by each owner of such mines toward providing and building necessary impounding dams or other restraining works. In the event of a petition being filed after the entry of such order, or in case the impounding dam or dams or other restraining works have already been constructed and *favorably considered* ACCEPTED BY SAID COMMISSION, the commission shall fix such amount as may be reasonable for the privilege of dumping therein, which amount shall be divided between the original owners of such impounding dams or other restraining works in proportion to the amount respectively paid by each party owning same. The expense of maintaining and protecting such joint dam or works shall be divided among mine-owners using THE same in such proportion as the commission shall determine. In all cases where it is practicable, restraining and impounding works are to be provided, constructed, and maintained by mine owners near or below the mine or mines before reaching the main tributaries of said navigable waters.

SEC. 17. That at no time shall any more debris be permitted to be washed away from any hydraulic mine or mines situated on the tributaries of said rivers and the respective branches of each, worked under the provisions of this act, than can be *properly cared for at or below said mine or mines, as per order of said commission, or by the restraining works erected in accordance with the directions of this act by said commission* IMPOUNDED WITHIN THE RESTRAINING WORKS ERECTED.

SEC. 18. That the said commission may at any time, when the condition of the navigable rivers or when the capacities of all impounding or settling facilities erected by mine-owners or such as may be provided by Government authority require same, modify the order granting the privilege to mine by the hydraulic-mining process so as to reduce amount thereof to meet the capacities of the facilities then in use, or if actually required in order to protect the navigable rivers from damage, may revoke same until the further notice of the commission.

SEC. 19. That an intentional violation on the part of a mine owner or owners, company, or corporation, or the agents or employees of either, of the conditions of the order granted pursuant to section thirteen, or such modifications thereof as may have been made by said commission, shall work a forfeiture of the privileges thereby conferred, and upon notice being served by the order of said commission upon such owner or owners, company, or corporation, or agent in charge, work shall immediately cease. Said commission shall take necessary steps to enforce its orders in case of the failure, neglect, or refusal of such owner or owners, company, or corporation, or agents thereof, to comply therewith, or in the event of any person or persons, company, or corporation working by said process in said territory contrary to law.

SEC. 20. That said commission, or a committee therefrom, or officer of said corps assigned to duty under its orders, shall, whenever deemed necessary, visit said territory and all mines operating under the provisions of this act. A report of such examination shall be placed on file.

SEC. 21. That the said commission is hereby granted the right to use any of the public lands of the United States, or any rock, stone, timber, trees, brush, or material thereon or therein, for any of the purposes of this act; and the Secretary of the Interior is hereby authorized and requested, after notice has been filed with the Commissioner of the General Land Office by said commission, setting forth what public lands are required by it under the authority of this section, that such land or lands shall be withdrawn from sale and entry under the laws of the United States.

SEC. 22. That any person or persons who wilfully or maliciously injure, damage, or destroy, or attempt to injure, damage, or destroy, any dam or other work erected under the provisions of this act for restraining, impounding, or settling purposes, or for use in connection therewith, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not to exceed the sum of five thousand dollars

or be imprisoned not to exceed five years, or by both such fine and imprisonment, in the discretion of the court.

SEC. 23. That upon the construction by the said commission of dams or other works for the detention of debris from hydraulic mines and the issuing of the order provided for by this act to any individual, company, or corporation to work any mine or mines by hydraulic process, the individual, company, or corporation operating thereunder working any mine or mines by hydraulic process, the debris from which flows into or is in whole or in part restrained by such dams or other works erected by said commission, shall pay a tax of three per centum on the gross proceeds of his, their, or its mine so worked; which tax of three per centum shall be ascertained and paid in accordance with regulations to be adopted by the Secretary of the Treasury AND THE TREASURER OF THE UNITED STATES IS HEREBY AUTHORIZED TO RECEIVE THE SAME. All sums of money paid into the Treasury under this section shall be set apart and credited to a fund to be known as the "Debris Fund," and shall be expended by said commission under the supervision of the Chief of Engineers and direction of the Secretary of War, in addition to the appropriations made by law in the construction and maintenance of such restraining works and settling reservoirs as may be proper and necessary: PROVIDED, That said commission is hereby authorized to receive and pay into the Treasury from the owner or owners of mines worked by the hydraulic process, to whom permission may have been granted so to work under the provisions thereof, such money advances as may be offered to aid in the construction of such impounding dams, or other restraining works, or settling reservoirs, or sites therefor, as may be deemed necessary by said commission to protect the navigable channels of said river systems, on condition that all moneys so advanced shall be refunded as the said tax is paid into the said debris fund: AND PROVIDED FURTHER, That in no event shall the Government of the United States be held liable to refund same except as directed by this section.

SEC. 24. *That the said commission in order to secure harmony in work to be constructed for reclamation and drainage purposes on said river systems with present plans of river conservation, or with such plans as may hereafter be adopted as provided by this act, having in view their protection from the encroachment of mining debris, or other material, and to promote efficiency and economy is empowered to consult thereon from time to time with a commission of engineers authorized to join such conference by the laws of the State of California. The result of such conferences shall be reported to the Chief of Engineers for transmission to Congress. The consent of the United States, in so far as it is necessary to confer same on account of its reserved control over said navigable rivers, is hereby granted to the State of California, or any municipal or local organization authorized by the laws of said State, to construct such works at its expense: Provided, That whenever the navigable waters of said systems are, or may be, affected thereby, the plans therefor shall be recommended by the commission created by this act and approved by the Chief of Engineers, United States Army.* THAT FOR THE PURPOSE OF SECURING HARMONY OF ACTION AND ECONOMY IN EXPENDITURES IN THE WORK TO BE DONE BY THE UNITED STATES AND THE STATE OF CALIFORNIA, RESPECTIVELY, THE FORMER IN ITS PLANS FOR THE IMPROVEMENT AND PROTECTION OF THE NAVIGABLE STREAMS AND TO PREVENT THE DEPOSITING OF MINING DEBRIS OR OTHER MATERIALS WITHIN THE SAME, AND THE LATTER IN ITS PLANS AUTHORIZED BY LAW FOR RECLAMATION, DRAINAGE, AND PROTECTION OF ITS LANDS, THE SAID COMMISSION IS EMPOWERED TO CONSULT THEREON WITH A COMMISSION OF ENGINEERS OF SAID STATE, IF AUTHORIZED BY SAID STATE FOR SAID PURPOSE, THE RESULT OF SUCH CONFERENCE TO BE REPORTED TO THE CHIEF OF ENGINEERS OF THE UNITED STATES ARMY, AND IF BY HIM APPROVED SHALL BE FOLLOWED BY SAID COMMISSION.

SEC. 25. That said commission, in order that such material as is now or may hereafter be lodged in the tributaries of the Sacramento and San Joaquin River systems resulting from mining operations, natural erosion, or other causes, shall be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable AND THE LAND ADJACENT THERETO, is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and on the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, *or at any point calculated*, in WHICH the judgment of said commission, *to* WILL effect said object (the same to be of such material as will insure safety and permanency), such restraining or impounding dams and settling reservoirs, with such canals, locks, or other works adapted and required to complete same. The recommendations contained in Executive Document Numbered Two hundred and sixty-seven, Fifty-first Congress, second session, and Executive Document Numbered Ninety-eight, Forty-seventh Congress, First session, so far as they *referred* REFER to impounding dams, or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations. The sum of fifteen thousand dollars is hereby appropriated, from moneys in the Treasury not otherwise appropriated, to be immediately available to defray the expenses of said commission.

Passed the House of Representatives July 18, 1892.

Attest: JAMES KERR, *Clerk.*

Notions About Patents.

Especially Those Connected With Metallurgical Processes.

SAN FRANCISCO, Nov. 5, 1892.

TO THE EDITOR:—The patent law insists, as I understand it, on the following conditions among others:

1. The thing oo which a pateot is claimed must be *an invention*, not a mere obvious resource of common or technical knowledge.

2. The applicant must be himself the inventor, and the first inventor, of the device, so far as known, admitting that the device may consist in a new combination of known devices.

3. The invention must be designed to produce a useful result. This is construed to mean that it must not be obviously pernicious to the public.

4. The applicant must offer, for public record, such a complete description of his device, whether a machine or a process, as will eoable any expert in the art to which it most nearly pertains to make and operate it successfully without further invention or discovery.

A discovery cannot be patented, but the application of a discovery to a useful purpose can. An idea or principle cannot be patented nor can a fact.

To illustrate: The discovery, or fact, that metallic gold can be dissolved by solutions of certain cyanides is not patentable; neither is the idea that this fact may be applied in the treatment of ores. It must be clearly shown how the fact may be applied and the idea realized in a practicable way before a patent can properly issue. The examiners, however, do not consider the *economy* of the invention as compared with other means of attaining a similar result. Again, a process of grafting the comma bacillus on the common cahbage, so that the consumers of cold-slaw should be sure to have the cholera, might be new and highly ingenious, but would probably be refused a patent because of its pernicious potentiality, while one for causing a dog's tail to divulge a rosebud on its tip would be granted a patent, because it would be unquestionably "new and nnvel," and, although the utility of such efflorescence of the canine caudal appendage might not be very obvious, it would not be pernicious and might please the dog.

Now, as to the patents on the cyanide process, the first in order because the first in date in this conntry, apparently, is the Simpson patent, which some think the most important. This patent claims what I at least do not want, and does not claim what I do want, that is as to gold, because I have tried it, and I think the same of it as to silver, on chemical grounds, although I have heard of a case in which a silver ore yielded to cyanide and salt while not yielding to simple treatment with cyanide. If I am wrong, and if my error should elicit correction, so much the better. I have my own reasons for doubting the reliability, though not the truthful intent of the statement as to silver ore.

As to the otber patents, as published in the MINING AND SCIENTIFIC PRESS of July 2d last, it may he that, as Daniel O Connell said of English acts of parliament, you could drive a coach and four through them, but a coach and four costs money, and then *you might have a breakdown* unless you have a very good driver.

Such as these patents are, they exist, and they cover ground which we may wish to occupy; possession is said to be equal to nine points in ten; the burden of proof will rest with the party who may undertake to break the patents.

Those who raise the outcry that it has been known for a long time that metallic gold could be dissolved by aqueous potassium cyanide must remember that a fact or a discovery is not an invention. Those who assert that the fact has been applied to the treatment of ore many years ago seem to forget the time and place when and where that application was made—a fatal oblivion which would upset the applecart of their contention with great dispatch. They must show that the substance treated was *ore*, not "sweeps," and that it contained base metal as well as precious metal; also that the solution used contained not more than 0.8 per cent of cyanogen, *v. patent No.* 403,302.

This patent seems to me to be the key to the situation. Without it the others would not amount to much, and the key to *it* consists in the alleged selective affinity of a weak solution, whence, ostensibly, the limitation as to its strength. I do not think selective affioity is the correct term for the observed fact. I do not think the alleged selective affinity exists. In truth, a weak solution, like a strong one, "prefers" several base metals to precious metals, and the proper interpretation of the fact observed by MacArthur is very different from that which he gives it. This, however, would not suffice to invalidate the patent if the practical application of the observed fact, as set forth in the specification, is really better for the purpose than the neglect to apply it. The limitation might seem to imply that stronger solutions *had* been used in lixiviating ores prior to the application for this patent, else why not have made the broad claim for a cyanide solution with an expressed preference for a weak one? A similar inference might be drawn from the Simpson patent, which, instead of claiming a cyanide solution, seems to "whip the devil round the stump," just for the sake of getting a patent, by claiming a mixture. It is remarkable what a very slight exhibition of *invention* suffices to obtain a patent sometimes. Could I get a patent on a little more water in my grog?

Inferences, however, are apt to mislead, and any one who has ever applied for a patent knows how the examiners badger and bully the applicant by means of all sorts of absurd and irrelevant objections, often compelling him to accept less than what he is entitled to as the only alternative to abandoning his claim entirely. It is quite possible that, in this case, the examiners were infloenced by the same sort of irrelevant objections that we hear expressed by the public. Be this as it may, no person can be interfered with for lixiviating any kind of ore with a solution containing two per cent or more of potassium cyanide or an equivalent proportion of sodium, calcium, etc., cyanide. In like manner, the precipitation of the metals by means of zinc is, perhaps, free to all, but not as described in patent No. 418,137.

The patent on the treatment of the ore, in certain cases, with lime or alkali, and then with cyanide, is another instance of the very liberal interpretation of the law by the examiners. The process of lixiviation with cyanide was known to MacArthur at least. The process of treating ore with lime or alkali to decompose base-metal salts was known and had been applied for the very same purpose of saving or protecting the cyanide solution long before, though in connection with amalgamation instead of lixiviation, as set forth, not for the first time, however, by me in the report of the State Mineralogist of California for 1888. The *invention* consists only in the conjunction of the two operations, the production of a useful result hy a new combination of two old devices, namely, neutralization by alkali and lixiviation with cyanide. Russell has a precisely parallel patent on neutralizing an alkaline ore with acid and then lixiviating with hypo. I think such patents are absurd, because it requires only a decent knowledge of his profession for any metallurgist to do such things whenever the occasion may arise. But what I think cuts no figure in the matter; the patent exists and it can only be set aside by a competent court.

Does any reader think that I have "flopped;" that I am defending these patents? Let him think so; hut, I again remark, inferences often mislead. What I think is, that I am telling the plain truth about the matter, for the benefit of whom it may concern, and in the hope of eliciting information pertinent to the subject from others.

There are people who think the patents are invalid, because some who try to work the process do not succeed, the inference being that the specifications are not explicit enough to enable one versed in the art, etc., to work by them. Inference again—but against it is the unquestionable fact that some do succeed; and how many of those who have failed could pass an examination as to their being "versed" in metallurgy? "Thou shalt not kick against the pricks," unless thou art well "heeled."

Finally, I am convinced that ores can be, and soon will be, treated hy means of cyanide solutions without interference with any existing patent. The precipitation by zinc is a mere makeshift, objectionable for reasons that I have touched on before; moreover, I am convinced that it is a chief reason for the use of very weak solutions, and for the *invention* of that "selective affinity." When we have a philosophical method of recovery we shall, I believe, be able to use stronger solutions with convenience; thus two of the patents will be disposed of. There will remain only the treatment with alkali, of which I will say no more just now.

The Mulloy process of precipitation, as described in the *Engineering and Mining Journal* recently, and now under trial in Africa, may result in solving the problem in a very neat way. In it a current is used, not to precipitate the gold directly, but to keep a sheet of mercury constantly and uniformly charged with sodium, and the gold and silver are precipitated by the sodium with regeneration of the solution instead of its deterioration, as in the zinc method. I think, however, that a simpler method will answer equally well, for gold at least. It is not that I have any definite scheme of my own in view, but I rely confidently on the inventive faculty of our people to give us what we require, and on competition tn give it to us at a very low rate of royalty, if any.

C. H. AARON.

Gravel Mining in Placer County.

From Our Traveling Correspondent.

The Forest Hill Divide.

October 15, 1892.

TO THE EDITOR:—The Forest Hill divide has, from the earliest days, been known as one of the richest gravel-mining districts in the State, its estimated yield being no less than $30,000,000. Lying between the north and middle forks of the American river, it reaches 40 miles to the summit of the Sierras. Mining operations have extended for nearly three-fourths of this distance. It represents the most complete and varied system of ancient rivers known on the coast, and has given the best opportunities for scientific investigation in this interesting field of geological study.

To Mr. Ross E. Browne, the eminent engineer, mining men and students are particularly indebted. He was the first to undertake the representation of these old channels and to preserve in permanent form, and in some manner systematize, the facts that the experience of 40 years has revealed. His map was published with the State Mineralogist's Report of 1890. With very few and minor exceptions, save, perhaps, in the case of the Morning Star channel, the developments of two years have further gone to prove the correctness of Mr. Browne's work as to the existence, general direction, continuation, etc., of the various channels. Of course, it is not a "Prospector's Guide," nor was it intended as such. I met, however, a number of meo who decried its value and even declare its publication a serious injury, in that eastern men, interested in mines here and believing to be in or working toward a certain channel, saw on the chart no channel at all, or else, perhaps, saw it going another and entirely different direction. The result was that they became alarmed or disgusted, and forsook the work. This is said to be particularly the case on the Baker divide, to the west of Forest Hill. Whether Mr. Browne is responsible or not, further work there has failed to find the unmapped but expected channel, and mining men are divided to-day as to its exact location or possible existence.

As is generally known, these ancient rivers really consist of three channels—the west and east, or rather the right and the left or upper channels, and the middle or lower and older. The former have afforded the great hydraulic mines and surface placers; the latter has been only approached by drift, and the gravel being cement in character, is valuable only by the milling process. Aside from the Red Point and Hidden Treasure, all the great mines of the present are of this class. The two excepted are io deep but uncemented gravel beds.

It is in the main channel or original Blue lead of the divide that the Paragon, Mayflower, Dardanelles, Gray Eagle and the mines under the town of Forest Hill are situated.

For many years tbe Dardanelles was considered the last point on the downward course of this channel. Below, the channel was not known and was not believed to exist. Six years ago, however, the Gray Eagle Mining Company started in three miles below the Dardanelles and three miles above the point where the Middle Fork of the American river cuts the divide. They have spent $150 000 io experimenting and have shown conclusively within the last two years the existence of the Blue lead at this point. Seven miles more of this ancient river course are thus accounted for and given over for future development.

THE GRAY EAGLE.—As noted this is the most recent enterprise on the divide. The property was first prospected thrnugh a shaft 375 feet deep and a short drift and incline 150 feet more to the bedrock. Thus justified, a tunnel was then run from the western slope in Owl Creek Canyon 2675 feet; an incline 165 feet long on ⅓ pitch brought them to the bottom of the channel, and the old workings and exposed both rims. The tunnel is the working passage. At the top of the old shaft are the old hoisting works, no longer used except the engines, which furnish steam to drive the hoist and the pump below. One ten-inch Hooker handles all the water at present. A north gangway has been driven 300 feet. The breast is carried forward about 60 feet wide and four feet high. The gravel, in places showing a thick sprinkling of free gold on the walls, is generally of a very fair quality and gives indications of improvement with the progress of the work. The mine cannot be said to be fully opened up as yet by any means as the channel was only struck in July, but no anxiety is expressed as to its future. The ten-

stamp steam-mill, completed the latter part of June, is running but ten hours a day for the present. T. G. Durning is superintendent.

ELECTRICITY as a motive power in mine operations seems to be coming rapidly into favor on the divide as in Nevada county. The Gray Eagle is considering the advisability of putting in an electric-power plant. A mile below the mill at the mouth of Owl Creek is an unsurpassed site fnr such an enterprise. The canyon affords a fall of 1300 feet in half a mile and sufficient water is readily available. The divide could then offer a worthy rival to Grass Valley in the matter of cheap power as the surplus force would be in demand by the other mines. Many of them are waiting for the Gray Eagle to act and should nothing be done by the latter they will put in plants themselves, notably the Dardanelles and Paragon.

The property to be greatest benefited by the success of the Gray Eagle in proving the existence of the mammoth channel is probably the Spring Garden, owing to its extent and favorable location. As it is likely to be the next big enterprise, and is considered by many the best property on the divide to-day, an account of it may properly be given here.

THE SPRING GARDEN.—It is a well established fact that the old river-bed claims have the advantage over quartz ledges in that, no matter how rich the latter may be, they are liable at any moment to pinch out and baffle all efforts to trace them farther. The river channel, however, seems more tractable and traceable in spite of its windings, and the oft-vexed question of "extension" is avoided.

Three hundred feet below the Gray Eagle's works is the boundary line of the Spring Garden. The company owning it is incorporated and is represented mainly by San Francisco and eastern capitalists. J. H. Widber, city treasurer of San Francisco, is president; another large holder is ex-Surveyor-General J. W. Shanklin, a well-known mining authority.

The property, comprising 520 acres under mineral patent, was worked early in the mining history of the State. It was noted for the rich gulches leading toward the Middle Fork, and from this slope $500,000 was probably taken out, and from a limited area. These mines were all in the west channel, the gold coming from the high rim In the deep lower channel too much water was met for the machinery of the time to cope with successfully. In 1874, an incline on the rim was run 125 feet, and from the bottom of this a tunnel 400 feet, when the bedrock again pitched and the water drove out the workmeo. They were then, however, in the Blue lead, from the blue cement character of the last gravel extracted, which estimated $12.50 a car. The facilities for working this mine surpass those of any other on the lower portion of the divide, as a tunnel can he run from the Middle Fork side at any depth required, offering natural drainage. Investigation has shown the main channel to extend nearly a mile through the property, the west channel about the same distance, and if an east one be found to exist, as is expected, it will have an extent of at least half a mile. A single tunnel 3000 feet long will drain and open for work the three channels.

THE DARDANELLES.—The Dardanelles is the individual property of Gen. Joe Hamilton of Auburn. Mr. H. F. Calenburg is superintendent. It is developed by a 2400-foot tunnel and a 30° incline 300 feet long on the rim to the bottom of the channel, which was reached early in the present year. The channel was struck here in a series of rapids, and work is going on toward the lower end at present, with a breast of 70 feet. At a distance of 40 feet, a large deposit of rich gravel was met, and for the past three months the mioe has been paying very well. The average of the gravel is $30 a car. Its showing is the most flattering of any on the Divide. It is working, though, to a great disadvantage with the present pumping and hoisting system. By this, the power is transmitted from the mill by an endless cable over a mile in length to the pump and hoist in the mine. Through faulty construction, the mill of ten stamps is only allowed a speed of 38 drops a minute in consequence. However, as soon as the present cable is worn oat, which will be in three or four months, electric-power will be adopted.

THE MAYFLOWER.—The opening of this mine in 1884 created an epoch in the mining history of the divide and lent encouragement and capital to the other operations. After spending half a million in developments, the Mayflower yielded the first week it was opened the sum of $87,000. Since then work has been carried forward 2200 feet south to the company's limits and north a mile from the working tunnel. This tunnel is 4000 feet long and connects with the channel by an upward incline 90 feet long. On this property is also a separate and cross-channel known as the Orono, which has partially cut through the original Mayflower channel. The Orono flows from east to west and crosses the other about 500 feet north of the working tunnel. In this second channel a drift 1300 feet in length has been driven and some very good gravel has been found in the past. Of late the work has been in a series of rapids which offer small encouragement. Breasting is going on in this from 30 to 60 feet in width, and also in the north workings of the original channel. The gravel from both channels at present is of only medium quality. The 20-stamp mill is kept runniog steadily, and about 50 men, a majority of them Chinese, are employed. Oscar Jones has been superintendent since the 1st of Julv.

I will continue my description of the mines of this region in another letter. CHAS. E. TOWNSEND.

THE Mining Bureau is in the receipt of some remarkable specimens of gold quartz from the E. D. M. mine, Fort Jones, Siskiyou county. Tbe specimens have been selected for the World's Fair exhibit of that county, and are wonderfully rich and unique in form. The mine from which they were taken was abandoned many years ago, but recent working has disclosed many rich pockets of ore.

Commercial Status of the Cyanide Process.

LOS ANGELES, CAL., Nov. 1, 1892.

TO THE EDITOR.—Since the "cyanide process" first began to attract the attention of the general mining public, it has been interesting to note the difference of opinion it has elicited. It seems that a certain class of mining men are hard to convince, or at least are very slow to accept the statements made by those who are in a position to furnish authentic information, giving as a reason, that "they are interested parties." For my part, I would rather depend on the statements of "interested parties" who certainly have given the matter careful investigation, than on the opinions of disinterested parties whose bias is apparently caused by a loose screw in their own moral makeup. By inference, their own statements would be unreliable were they "interested;" hence their distrust of others.

It seems to me that the gentlemen composing the Gold and Silver Extraction Mining and Milling Company, would not take hold of the process without first giving it a most exhaustive investigation, much less make extravagant claims knowing they could not be fulfilled. Were they irresponsible parties whose sole aim was to sell local rights, they might, it is true, reap quite a harvest for a short time by representing their process to be a universal panacea for all the ills that the metallurgy of gold and silver is heir to; but note their method of doing business; they claim their process to be adapted to a class of ore which happens to be of very common occurrence. They claim a high per cent of extraction. They claim a reasonable cost. They offer every facility for a thorough investigation to those who contemplate interesting themselves. They look principally to the royalty for their remuneration. Does this show on their part, any lack of confidence, either in the merits of the process or the validity of the patents? Are they not to be credited with at least average business sense?

I am like Mr. Aaron in one respect; I should prefer that metallurgy were not hampered by patents unless I could own them myself; but seriously, are not the people who bring the process into notice entitled to some pecuniary reward, or are they to receive their reward in heaven? That is where Mr. Paul, Mr. Aaron and others that could be mentioned, must look for their reward for their pursuit of truth for truth's sake, and their thankless endeavor to set the world right. If I remember rightly, it was only a short time ago that an anonymous contributor to your paper who would doubtless be honored by being allowed to black Mr. Paul's shoes, designated him as a "crank on processes." I wish the metallurgical machinery of this State had a few more such "cranks."

In view of the many comments on the cost of the process, I will give the details of one of the many experiments made by me for the purpose of determining the actual commercial status of the process under favorable circumstances. All things considered, the results given are the best I have been able to attain. Material operated on was arrastre tailiogs, equivalent to 30 mesh; free gold had all been extracted by amalgamation; average assay value, by very careful sampling was $8.27 per ton; three tons were leached 48 hours with 2400 pounds of four-tenths of one per cent solution; three tons were leached 120 hours with 3000 pounds of two tenths of one per cent solution, in both cases till the tailings assayed but a trace. Assay value of the six toos, $49.62. amount extracted as shown by bullion returns from Selby, $46.75, of which about 75 cents was silver; equivalent to 94.2 per cent extracted, leaving 48 cents per ton, or $2.87 in all, which disappeared during the process. Cyanide used, 7.65 pounds; at 50 cents per pound for 98 per cent, would be about 65 cents worth of cyanide per ton of ore treated. Zinc was used as the precipitating agent, and apparently worked to perfection.

FRANK ALDERMAN GARBUTT.

Shasta County Mines.

Texas Consolidated Mines and Mill.

REDDING, SHASTA CO., Nov. 4, 1892.

TO THE EDITOR:—In a direction 18 degrees east of north, and at a distance of six miles from the Scherer group, lately described in the PRESS, is situated the Texas group of mines. The Sacramento river divides them, showing a slate formation for the entire distance. Mr. R. G. Hart, the enterprising owner is rapidly developing his property; work is now being done in the fourth level, 700 feet below the summit; another level will soon he commenced 200 feet farther down.

On the surface and in the two upper levels the formation is an auriferous slate. This changes, as depth is gained, to a dark talcose slate, richly mineralized in the walls. There are three parallel ledges; the east ledge pitches 65 degrees east; the middle and west ledges have a pitch of 50 degrees east, and there is every indication that they will come together as depth is gained in the workings. The walls are perfect, carrying an unvarying gouge of a slaty nature; the metal is well distributed through the quartz, that is of a ribbony character from wall to wall. The direction of the lode is nine degrees east of north. Cross-sections on all of the ledges show that the ore-shoots commence at the apex of the mountain through which the ledges pass, and these shoots gain in length with the trend of the ledges.

In the fourth level the ore-shoot is almost continuous. This level was commenced in June, 1890, and has been driven for a distance of 800 feet on the east ledge, it, as well as the other tunnels, following the direction of the lode. The walls are well defined on the mountain-side, and for 300 feet there was nothing met with but decomposed rock. Soon, however, the ore-body was struck, and as work has been carried forward, a proportionately larger and richer body of ore has been brought to sight. The ore is of the character known as "ribbon-rock," and is stained with tellurides, the sulphurets being arranged in streaks through the ore, from wall to wall, and averaging from two and one-half to three per cent, with much free gold in places. The width of the vein in this level is 12 feet.

The ventilation is good, as the upraises have been carefully planned; timbering good, but only necessary in connection with stoping work. The stope in tunnel No. 4 is 200 feet long and opens up a fine body of ore. Ore is also being taken out of levels 2 and 3. A gravity tram conveys the ore from the second to the third level, a wire rope-way takes the ore from No. 3, passing No. 4, and taking it from there to the mill. There is 627 feet fall from No. 3 to the mill, and the cable is 10,400 feet long. The buckets carry 125 pounds of ore, and the cost of running is trifling.

Level No. 1 is 330 feet below the summit and is 300 feet long. Level No. 2 is 85 feet lower; length, 600 feet. Level No. 3 is 120 feet lower than No. 2; length, 1100 feet. Four years of continuous work have been expended by Mr. Hart upon this property, with the exception of Sunday, which Mr. Hart believes should be a day of rest for all hands.

The plant consists of a 20-stamp mill with eight concentrators and a number of Morris tables for slimes. A Dodge pulverizer was first in use, then a ten-stamp mill. There will now be 40 stamps necessary to keep pace with the ore in sight. A steam-pump takes water from the Sacramento river close by, and a very large tank is kept constantly filled; this supplies the mill and is a safeguard in case of fire. There is immense waterpower in the Sacramento, as the river is wide and deep, with a powerful current all the year round, fed hy the melting snow on Mount Shasta, 14 400 feet high.

The grade of the concentrates is high. Selby's returns were carefully examioed, Mr. Hart's courtesy allowiog this privilege. The average is $250 per ton in gold, the highest being $500. They also carry some silver, about $14 per ton all round. The percentage of sulphurets is two and one-half to three per ton. Ore lately taken out goes even higher, and, owing to its richness in sulphurets, it is being shipped to Selby's smelting works as it comes out of the mine. A store, postoffice and substantial buildings indicate a prosperous community, and Mr. Hart is to be congratulated upon his judgment and the manner in which he has persevered in opening up hls property. Plans for a cantilever bridge across the Sacramento have been made, and the railroad company have agreed to make connections, etc., on the opposite side of the river.

WM. G. HODSON, A. B. T. C. D.

Mining in Washington.

The mining outlook for the State of Washington is flattering, says the Seattle *Mining News*. Last year many hundreds of mineral locations were made; this year assessment work necessary to hold the property is being done in every district, and richer finds and better ledges are the result. Not one quarter the gust and blow that we heard last year is heard now, hut quiet, energetic work is going on. Last year no mining districts were reached by the locomotive; only preliminary surveys were made. This year millions of dollars are being put into railways leading to the mining districts. Last year the suggestion of a railroad to a remote mining district was ridiculed; now permanent surveys have been made, and strong companies organized to build the road. This is an off year; presidential year. Money among the masses is exceedingly close; no excitement in any legitimate business; all is quiet. The mining locations, as a rule, are only receiving a little necessary work to entitle the claimant to government protection; this, however, is not proof that the properties are not first-class, and may not bring rich reward to the owners. As a further proof of the value of these claims, we hear almost every day a miner, from some mining State or Territory, say that were prospects he sees here, in this or that camp in the State or Territory from which he hails, they would sell readily for much greater figures than is asked for them here. Many old prospectors openly express disgust at the figures fine mining claims are being sold for, a mere bagatelle, they claim, as compared with what a similar claim would bring in their former home. This is a substantial proof as to the depression in mining properties in Washington to-day. But with the advent of roads, railroads, and good wagon-roads taking the place of almost impassable pony-trails, ore can he shipped to the smelters, or concentrators can easily be shipped in. Another year will see all this done. The dull smoldering, that now is, will break forth into a flame that will please the patient ones. Next year, when the carloads of ore rich with gold and silver come rolling into the Sound cities, it is bound to create an excitement that will give such an impetus to mining as has not been felt on the Pacific coast in many a year. Any one who will take the time to post himself will admit the facts and logic of the above; yet the mining men do not realize what is just before them if they will wait with patience. Some of them will trade off their birthright for a mess of pottage any day, and consider it a good deal as did one of old. Washington's coal and lumber is being shipped to California and Australia, her lumber to Chicago, her wheat to Liverpool, but her greatest industry lies dormant, wrapped up in the bosom of the earth; but just now the mining world is beginning to look this way; letters of inquiry are beginning to come in; soon will follow men with means to develop as fine prospects as can be found in any country. To the present time, men who have invested in Washington properties have done so as a pure speculation. They are not mining men, do not intend to mine; they bought to sell again. Men that we are now looking for are mining men, men of experience in mining, who will take hold of the unbought prospects and make mines of them.

Scientific Progress.

Disinfectants.

Despite the immense progress made of late years in the study of bacteriology and kindred matters, somewhat vague ideas exist on the part of the general public, as to both the action and effectiveoess of disiofectant agents. Under this head we include, in the first place, all chemicals capable of destroying germs of any sort, by the diffusion of vapor or gas in the surround ng air. Many, but not all, disinfectants are antiseptics as well. They are all deodorants, *i. e*, the odor will overpower those of the drain or sick room; but all deodorants are not necessarily thorough disinfectants. Disinfection can, in the second place, be attained without the use of any disinfectant whatever—*i. e.*, by the agency of heat. This is more seldom resorted to, because it is often inconvenient to apply it. Scientists assert that the germs of nearly all known diseases resist any temperature up to 230 degrees, so that the boiling point, 212 degrees, is not sufficiently high. To attain the former temperature, apparatus must be used, to which we will refer after dealing with chemical disinfectants.

CARBOLIC ACID.

The commonest household disinfectant is probably that sold under the name of crude carbolic acid. This consists in a mixture of pure carbolic and cresylic acids, and is of a reddish brown color. Its strong, tar-like odor renders it a not unpleasant deodorant, but its solubility in ordinary water, which is in inverse ratio to the amount of cresylic acid present, is at first sight a considerable drawback. It mixes, however, much more freely with hot water, and for all practical purposes the solution thus produced is sufficiently useful. Patients sometimes object to the smell, in which case some other disinfectant must be chosen, but it is not disagreeable to the majority, while its cheapoess renders it acceptable in prisons, public offices, railway stations and private houses, where economy is an object. A refined preparation of the above, known as crystalline carbolic acid, is, though dearer, of much more easy application. It mixes readily with warm water, so that a saturated solution is easily made, and it is not only a disinfectant, but is largely used by medical men as an antiseptic in dressing wounds, etc. It may not be generally known that pure carbolic acid produces a disagreeable though not daogerous result when applied to the bare skin. An assistant connected with a public museum, of which we were in charge some years ago, plunged his hand and arm into a bucket containing a quantity. A smarting sensation caused their hasty withdrawal, and for some little time he was much alarmed. Speedy treatment with olive oil, however, at once mitigated the pain, and although the skin became shiny and the epidermis peeled off, no serious results followed. For everyday, domestic use, carbolic acid in either form is probably the best disinfectant procurable. We need hardly say that its action on the mucous membrane is most disastrous, and that if any quantity be taken into the mouth, death will probably result; great care should therefore be taken to keep bottles containing it away from the chance of being handled by children. It is also dangerous to the eyes if a drop accidentally splashes into them.

SULPHUR.

Sulphur is an older and better known disinfectant than carbolic acid, but its application is less convenient. It is, in the first instance, necessary to make the room, etc., to be disinfected reasonably airtight, so far, at all events, as shutting all doors and windows goes, while its fumes are so distressing to human beings that few can stand their application for even a short period. In former days it was extensively used to fumigate vessels which had become overrun with rats or whose crews had been subjected to the attacks of yellow fever, cholera, etc. In some cases vessels were both fumigated and sunk. In hospitals, prisons, etc., it is of course practicable to fumigate wards, etc., with sulphur when the inmates have been removed, and no great difficulty is presented by the same operation in a house, provided the room to be treated can be kept unoccupied duriog its progress. This usual way of fumigating is to take about an ounce of sulphur to every 20 cubic feet of air space, and place it in a metal pan or dish, floated on the surface of water in a bath or tub. It readily ignites, and should be kept burning for at least a couple of hours.

CHLORIDE OF ZINC.

Chloride of zinc is a favorite disinfectant with many people. It is dissolved in water, and the clothes, etc., to be disinfected are plunged into the solutioo and then dried. It is less used now than formerly, but before carbolic acid became popular was greatly relied on. It is not so powerful a deodorant, and some people dislike the smell, but it is a handy household adjunct.

SULPHATE OF IRON.

This substance, which is commercially cheap, is a capital disinfectant when large quantities have to be applied, as in the case of drains, cesspools, etc. It is not dangerous as a poison, and may therefore be used by persons whose discretion when handling carbolic acid, etc., is doubtful. Hospitals at one time used it a good deal, especially in the United States.

CHLORINE.

This is an admirable disinfectant, but its application for domestic purposes is even less convenient than that of sulphur, inasmuch as not only must every aperture in a room be carefully stopped up, but a chemical process has to be performed. A writer in the *American Druggist* gives the following formula: The cubic space having been calculated, one ounce of a mixture composed of equal parts of sodium chloride and manganese dioxide, to which is subsequently added a fluid-ounce of a 50 per cent solution of sulphuric acid in water, is taken for every 100 cubic feet of air space. On the addition of a sulphuric acid solution to this mixture chlorine gas is freely liberated. Any compound of this gas which contains it in loose combination is well adapted for ordinary household use as a deodorant and disinfectant. The official calx chlorioata is a good example of this; when freshly prepared it contains about 33 per cent of available chlorine, which is rapidly parted with on simple exposure to the air. A solution of it in water, of the strength of four ounces to the gallon, is recommended by the American Public Health Association in the disiofection of excreta.

Other preparations of this substance in frequent use, adds the writer, are represented by Labarraque's solution and Javelle water; but the false sense of security engendered by the use of these and the chlorinated lime, when employed as deodorants, is to be carefully guarted against, their peculiar properties of neutralizing bad odors not always being a sufficient evidence of thorough disinfection.

DISINFECTION BY HEAT.

Returning to the question of disiofection by heat, its application is beyond the range of ordinary domestic arrangements. Dry heat is less effective than moist, the latter being applied by filling close chambers with moist steam under high pressure. But while, as above pointed out, boiling water is not necessarily of a sufficiently high temperature to serve as an absolute disinfectant, its use is highly advantageous if extended over a prolonged period. Boiled water is, under all circumstances, safer for use than water which has not been boiled, and clothes which have been boiled for some time are less likely to carry infection than those which have been simply washed. It may be useful to add, in conclusion, that no known organism resists a temperature of 270 degrees.—Discovery (England).

Manufacturing Artificial Stones.

The manufacture of artificial stone has been based upon the application of silicate of soda, which certainly produces, in combination with different stone compounds, a fair material as to strength and appearance, but is found to be liable to cracks, and finally ruptures, during the course of time.

The object of the new invention is to produce an artificial stone in the manufacture of which the fundamental material is silicic acid, which is beforehand deprived of all bases or salts, especial care being taken that no alkaline salts remain therein, which is done by absorbing the same by acid of lime. The silicic acid being powdered aod subjected to treatment, may be thereafter added to any of those compounds necessary for the various imitations. Another important feature in combination with the process is to subject the ready molded stone to a steam bath, and thereafter to a treatment with chloride of calcium The product is said to be by no means inferior to real stone as to its aspect nor as to its strength, or as to its liability to be influenced by weather or time.

Silicic acid, after being ground to powder, is cleansed from all impurities by ordinary means, and five to ten per cent thereof mixed up in warm, river or rain water, which either is applied to slaked well-burnt lime or is added to hydraulic lime. The resulting product of this process, which is silicate of lime, is mixed with sand and also small portions of fluorspar. This mixture may be cast into molds, so as to give various shapes, as desired. The molds then being removed, the castings are allowed to dry as long as 12 to 24 hours, after which time they will be as dry as atmospheric air. They are then brought into a steam boiler aod steam blown through, so as to drive out all air, after which the boiler is hermetically closed up and steam let in uoder a pressure of 10 atmospheres.

In this high-pressured steam bath the stones remain 48 to 72 hours, and thereafter they are submitted to a bath of boiling and saturated chloride of calcium during 6 to 12 hours, also under a pressure of about 10 atmospheres, which may be dooe in the same boiler. The condensed water may be used for the bath. These stones are allowed to dry in the open air, or, when desired to dry quickly, steam may be once more made to circulate inside of the boiler after the chloride of calcium has been withdrawn, and before the stones are taken out. These stones also take any desired coloring and polishing, like common stone.

It is claimed that artificial stones manufactured by processes known heretofore were never perfectly deprived of all salts or bases, which are the causes of the destruction of the material, because all salts have the natural teodency to attract and absorb acids. This also is the case with small particles of bases contained in artificial stone known until this day. They draw carbonic acid out of the atmospheric air, and combine themselves chemically therewith. These particles of bases, however small, when bound to acid, expand and force the neighboring or surrounding material to separate, thus causing rents and cracks. These cracks in the beginning are scarcely visible to sight, but widen and deepen in the course of time, soak up water, which water in itself, by freely giving off carbonic acid to the bases, eohances the destruction of the stone, and also may lead to complete and sudden rupture when in winter the water freezes, and thereby expands. This, it is asserted, is not possible in stones manufactured by this new process, and they are also perfectly fireproof and will stand agaiost weather like ordinary stooes.—Paper Trade Journal.

Mechanical Progress.

A New Cast Iron Decorating Method.

Mons. Faure has devised a new process for the decoration of cast-iron objects. During the last few years, he says, the demand for heating apparatus and other cast-iron articles has grown considerably, chiefly owing to the circumstance, he thinks, that every effort has been made to render them more agreeable to the eye by the employment of various exterior coatings, such as, for instance, enamel, nickel, copper, etc. These divers decorative methods have, however, the fault, Mons. Faure avers, of exhibiting too great a uniformity of tone. It is this presumable defect which he has set himself to correct, and he believes that he has obtained his object by the application to the casting of a coat of enamel and of metal, or of two layers of enamel of different shades. To obtain the desired result only fancy articles should be treated, the reliefs of which are as much as possible on the same plan, as the work is hereby rendered both less difficult and less costly. With a casting of this description, the operation is conducted as follows: First, the entire surface of the piece is enamelled with any required shade; the casting is then passed to the file-wheel, which removes the enamel from the relief portions, and afterward to the burnisher, which polishes the reliefs. The first part of the manipulation finished, the article is taken to the nickel, copper or other metallic bath. The metallic deposit of course, only adheres to the burnished surfaces. A casting is thus obtained with the indentations enamelled and the reliefs copper-plated and nickel-plated, etc., as the case may be, or even simply polished, the result being a very fine imitation of wainscoting. To obtain another decorative effect, the relief parts of the article could be bronzed as soon as it has been subjected to the glazing operation. Still another embellishment may be procured by first enamelling and glazing the object as indicated above, repassing it through the furnace, and then applying a second coating of transpareot enamel of a different shade from that of the primary layer. It is easy to understand that the indented portions having two coats of enamel, and the relief parts only ooe, the surface of the casting would present a very fine diversity of tones.—Iron.

SAND FOR MOLDS.—A good sand, says the *American Manufacturer*, should be refractory to the highest degree; it should neither crackle in contact with the liquid metal, nor set free too much gas; it should neither split nor become too compact on extreme dryness, as the withdrawal of the castings would become too slow and difficult. There are several mixtures of refractory materials, more or less plastic, capable of furnishing good casting molds for steel. The following is one formula: 52 per cent of the debris of broken crucibles, 43 per cent of the debris of refractory bricks, 5 per cent of clay. Sometimes, when this mixture is found to be too close, cokedust is added, which thins it out and increases its porosity. The casting sand for steel is ground up and mixed in the ordinary manner for moulds for pig. A little molasses is sometimes added to render it more workable to the hand. After the model has been removed the molds are washed over with plumbagine and then dried in a stove. When the form of the casting permits of a regular shrinking it is left to cool in the mold, but most frequently there would be risk of fractures and the removal must at once be proceeded with. The castings are thrown, while still red hot, into a furnace to cool, brought to red heat, and recooled along with the furnaces By operating in this way fractures are almost always avoided.

Cast Steel for Dynamos.

Some years ago dynamo specifications always provided that the field magnets should be made of the best Swedish wrought iron, and that the copper used was to be of 98 per cent conductivity. No one knows what difference it made to the customer what iron or copper was used when the output and efficiency were specified also; but probably the consulting engineer thought it made him appear as if he fully understood dynamo design. It is needless to say that dynamo-makers used the iron that suited them best, and called it "Swedish," and the consulting engineer looked very scientific, and examined the machine carefully to see if the brushes were set at the particular angle he had specified. The idea that there is some special virtue in wrought iron for magnets still lingers, but many makers have found that it is better to use cast iron, in spite of the extra copper required to reach around it, because the extra cost of the copper is more than compensated for by the saving in labor in using a casting that needs comparatively little machining. There was some excitement among dynamo-makers when "mitis" metal came to the front. Mr. R. C. Jackson patented dynamos made of it, and others also made inquiries and experiments. The price was too high, however, and "mitis" metal never came into use for dynamo work. Cast steel is now rapidly coming to the front for large dynamos. Mr. C. Frewen Jenkin designed steel dynamos for the London and North-western Railway Works some years ago, having first tested the cast steel made at Crewe, and having found it almost as good as wrought iron. Now Messrs. Crompton & Co. are using it, and Messrs. Brown & Boveri employ it in all their large machines. The only difficulty is to get good castings. This is possible when they are large, but dynamo-makers now want small castings, which are quite sound, and do not cost as much as wrought iron, or as the same magnetic carrying capacity in ordinary cast iron. —Industries.

BICYCLE-FRAME CONSTRUCTION. — A Coventry firm has for some time past been experimenting on a new method of constructing the frames of safeties and cycles. By its means, says the *Cyclist*, they are enabled to entirely do away with castings and stampings, and the whole frame is built entirely from weldless steel tube and sheet steel. Under the new method the fork crowns, the bottom bracket and the barrel of the steering post are made of sheet steel bent into a circular shape, and left with projecting lips. The tubes are split for a length of two inches, and into these the lips are fitted and fixed by brazing in the usual manner. The advantages are that the difficulty which has hitherto existed in brazing heavy castings, or stampings to a light tube, is entirely done away with; the joints, when plated or enamelled, are quite invisible; the frame can be made far lighter than at present, and is of the same thickness throughout. Where it is deemed necessary to strengthen the barrels, shoulders are introduced and brazed into the inside. A roadster frame made in this way weighs just over three pounds, and the firm are so satisfied with the trials of their experimental machines that they have decided to construct all their 1893 cycles on these lines. The process has been, or is being, patented throughout the world.

SOME NEW AND VALUABLE TECHNICAL BOOKS,

RECENTLY PUBLISHED

DEITE.—A Practical Treatise on the Manufacture of Perfumery Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentrifices, Cosmetics, etc., etc.; with a full accounnt of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. Deite, assisted by L. Borchert, F. Eichbaum, E. Kugler, H. Toepffner, and other Experts. From the German by William T. Brannt, editor of "The Techno-Chemical Receipt Book." Illustrated by 28 engravings. In one volume, 12mo, 358 pages, price.....$3.00

LANOBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, Proprietor of a Manufactory for Chemical Products, Machines, Apparatus, and Utensils for Electroplaters, and of an Electro-plating Establishment, in Leipzig. With additions by William T. Brannt. Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price..... .....$4.00

LARKIN.—The Practical Brass and Iron Founder's Guide. A Treatise on Brass Founding, Molding, the Metals and their Alloys, etc. By James Larkin, late Conductor of the Brass Foundry Department in the Penn Works, Philadelphia. A new revised and greatly enlarged edition. Illustrated. 12m, 400 pages. Price, ...$2.50

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hektograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks, Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stamp and Stencil Inks, Wash Blue, etc., etc. Translated from the German of Stomund Lehner, Chemist and Manufacturer, with additions by William T. Brannt. Illustrated. 12mo. 230 pages. Price..... $2.50

OSBORN.—The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Geeorn, LL.D., author of "A Practical Manual of Minerals, Mines and Mining." Illustrated by 44 engravings. 12mo. 175 pages. Price $1.50

WAHNSCHAFFE.—A Guide to the Scientific Examination of Soils. Comprising Select Methods of Mechanical and Chemical Analysis and Physical Investigation. Translated from the German of Dr. Felix Wahnschaffe. With additions by William T Brannt. Illustrated by 25 engravings. 12mo, 177 pages. 12mo. Price $1.50

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process,** Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. Tabor, Pres.; Leonard Gow, V. Pres.; H. A. Jones, 2d V. Pres.; P. Geo. Gow, Technical M'g'r. and Ass't Treas.; T. L. Wiswall, Gen'l M'g'r. and Sec,y; Peter McCourt, Treas.; W. L. Cooper, Eng.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver: The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal.; The Gra Bella Mining Co., Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as as rule, does do exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold, ores pyritee, hematitee, manganese and telluriun. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 926, Gen. Mgr. and Secretary.

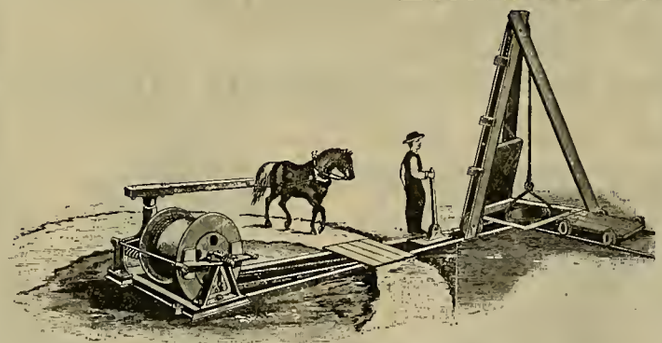
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving geare the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increasess the capacity of the machine by avoiding the lose of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

A. T. Dewey, W. B. Ewer, Geo. H. Strong. } **Dewey & Co.'s Scientific Press Patent Agency** { Established 1860

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not few. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

RUPTURE, PILES and all Rectal Diseases positively cured, in from 30 to 60 days, without operation or detention from business. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. Stricture and Urinary Troubles Cured No charge unless cure is effected Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 838 Market Stree San Francisco, Cal.

Useful Information.

Exterminating Mosquitoes Around a Country House.

A writer on the subject of the extermination of the mosquito tells of an experiment he made with kerosene as the destroying agency in the Catskills. Noticing a few mosquitoes about the porch of his cottage on July 5th last, he made a search for their breeding place and found it in a rain-water pool, having a surface area of 60 square feet, in the neighborhood. Eggs had been deposited freely on the water, and it was very plain that the cottager was destined to be annoyed by innumerable mosquitoes unless a remedy was applied at once. He determined to apply kerosene, and sprinkled four ounces of it over the surface of the pool. At the end of ten days it was covered with dead insects, which the writer estimates at 7400. Most of them were gnats, but there were 371 female mosquitoes and many males. The number may appear trifling enough, but on that score the experimenter has this to say: "Now, the average number of eggs laid by a female mosquito is 300, and the destruction of these 371 specimens prevented the development of 111,300 individuals of the next generation. Moreover, certain females flew away after touching the surface of the water and undoubtedly died at some distance from the pool, so that the effect of the application was even greater than these figures indicate. In fact, the capacity of the remedy was only limited by the number of the mosquitoes seeking the surface of the pool for egg-laying purposes, and in a locality of greater mosquito abundance the estimates of the potentiality of the remedy would have been enormous. And now as to the question of expense. This experiment proves that at this rate of application one barrel of kerosene costing $4 50 (and the cheapest of oil is preferable to the more expensive) will successfully treat 96,000 square feet of water surface. It is probable that there are many mosquito-ridden neighborhoods where the total area of the breeding places does not exceed this figure, and where at the slight expense mentioned, provided the application be made early in June, so as to head off the first generation, the numbers of the biting pest may be reduced to a minimum.—N. Y. Evening Post.

WHERE THE GOLD HAD FLOWN.—"Guld," says a mintmaster, "melts at 2016 Fahrenheit; but it evaporates and passes off at a much lower temperature than melting heat, and also if it be maintained in a molten state for any considerable time before it is passed into an ingot." Ignorance of this metallurgical law once caused consternation to temporarily reign in the hearts of the staff of an American coinage factory. Soon after the San Francisco Mint commenced operations, an inspector visited it to take stock, and discovered a shortage of about $160,000. The employes expressed amazement, which quickly developed into dire alarm when arrests for theft were threatened. But before it was deemed necessary to adopt such stern measures some one suggested that evaporation had caused the deficiency, and that the missing metal had gone up the chimney. Acting upon this hint, a daring individual ascended the flue, and, to his own and his comrade's great relief, he found the lost gold on the roof, where it had condensed as it came in contact with the air. The slates were taken off the mint building, and the tiles of a church and other contiguous edifices were also removed. This argillitic collection was ground to a powder, and the gold was recovered. The brickwork of the furnaces and chimneys of the mint was similarly treated; and after the San Francisco authorities had regained as much gold as they could with the appliances which they possessed, the dust was sent to the Philadelphia Mint and worked over more closely. Finally the triturated material was sold to French chemists, who intended, it was understood, to subject it to a still more careful manipulation. In this way more than one-half of the original deficit was eventually covered.

PROF. VERNON BOYS lately brought together in the United Presbyterian Church Synod hall, Edinburgh, a monster audience to hear his lectures, with experiments, on "Electric Spark Photography." In the course of the lecture, Prof. Boys explained that, by the electric spark, articles moving at the rate of 10,000 miles an hour can be photographed, and by the introduction of a revolving mirror, a speed of 180,000 miles an hour can be coped with. The mirror makes 1024 turns every second, worked by electricity, which is equal to about 150 times as fast as a rifle bullet travels. The whole photographic power of the spark is over in a time equal to the ten or eleven millionth part of a second, and it is during that incredibly brief space that the image is made on the sensitive plate.

CYANIDE PROCESS TESTS.—All experiments upon ores with the cyanide process are being watched by mining men; accordingly the following from the *Chloride Belt* of Candelaria, Nev., will be read with interest: Professor Storch the well-known metallurgist, arrived here Wednesday from Silver Peak, where he has been for the past two months. During this time he has made a thorough test of the cyanide process and demonstrated to his satisfaction that it is the most successful method of treating gold tailings. He did not make any tests on ore, but confined himself to old concentrates, the property of John Chiatovich. These concentrates consist of over 80 per cent of hard, indissoluble lumps, while hardly 20 per cent of the stuff will pass a No. 40 screen, and as the whole was tested without separation, the following result was obtained: After 24 hours' filtering, 34 per cent of gold from the fine stuff and only two per cent from the lumps; after 51 hours' filtering, 58 per cent of gold from the fine and nine per cent from the lumps, and so on. An equally successful test was made with the John I. Blair tailings at the old Silver Peak mill. There are many thousands of tons of these tailings at the Peak, and the demonstration, by a gentleman of Professor Storch's reputation, of the fact that they can be profitably worked, is of importance to this entire section. The professor has designed a leaching plant of 20 tons daily capacity for John Chiatovich, which will be erected at once at the Peak.

TWIN screws beat side wheels in a scrub race between the Sound steamers Puritan and Richard Peck. The latter is a new steamer built at Wilmington, Del., for the New Haven line, and is the first boat regularly running on Long Island Sound to use twin screws, though single-screw steamers have been running for some time.

IT is claimed that the addition of a percentage of sodium to molten copper not only makes it cast sound, but also hardens it. A patent has been issued to the discoverer, Mr. I. D. Bottome, of New York city.

HORACE D. RANLETT,
Ores, Mining, and Commission,

Electricity.

It is Edison's Lamp.

The controversy over the fundamental patent for the incandescent lamp is finally settled. In a supplement to the *Electrical Review* was given a digest of the decision of the United States Circuit Court of Appeals, sustaining the Edison claim to a filament of carbon mounted in an all-glass vacuous globe. The second claim, which was the bone of contention on account of the alleged vagueness of the term "filament," was thus paraphrased by the court: "The combination of carbon, filamentary or thread-like in size and properly carbonized, used as an illuminant in an incandescent electric lamp, with a receiver made entirely of glass and conductors passing through the glass, and from which receiver the air has been exhausted to such an extent that disintegration of the carbon, due to the air, wasting action of surrounding gases, or to any other cause, is so far reduced as to leave the carbon practically stable." This construction is sufficiently broad to include all forms of incandescent lamps now on the market, and puts in the hands of Mr. Edison's assignees a monopoly of the entire lamp industry.

Thus after many years the inventor is placed in full possession of his own creation, for to Mr. Edison more than any other undoubtedly belongs the honor of creating the industry of incandescent electric-lighting. It is unfortunate that the legal processes of sustaining or defeating a patent are so slow. The contest just concluded has been fought for seven years, during which rival companies have invested heavily in incandescence-lighting, believing, with what Judge Wallace thought was good warrant, that the patent was too uncertain in meaning to be given the scope claimed for it by its friends. Unhappily, the same charge might be laid with more or less effect at the door of every broad patent. The draughtsman of a claim is confronted by two difficulties. If he makes it too broad, the patent is void; if too narrow, the patent is worthless. In either case, his client's rights are forfeited. Confronted by Scylla on one side and Charybdis on the other, he steers between as best he can. It is utterly impossible for the human mind to anticipate all ramified by-ways of future infringers. This predicament accounts for much of the alleged vagueness of patent claims. It is simply a selection of terms of definition sufficiently elastic to bear a little shaping at the hands of the court. The word "filament" has proven to be a term of this character. In the light of Mr. Edison's great contribution as a pioneer of the art, it might be said those who ignored his patent did so wilfully—his equities in the case were strong; but on the other hand the prior state of the art had shown burners of various degrees of thickness—some of which might have been logically described as filaments, thus throwing a cloud over the patent which rendered its ultimate triumph doubtful. There is a cure for these difficulties; if the fate of a patent could be definitely settled in a year—and it ought to be—all business dependent upon patents would be put upon a firm basis, invention would be stimulated by the promise of quick reward, the courts would be relieved, the infringer could apply his energy in more useful work, and increased prosperity would result all around.

So far as the general public is concerned, the decision will doubtless not be felt. The light will be just as cheap and just as good. Whether the rival types of lamps will be made at an Edison factory, or licenses will be given to the several makers, remains to be seen. The Edison Company, or its assignees, will pocket some dividends and those who, believing the patent worthless, went into the lamp business, will resign themselves to the situation. In about four years, at most, the patent will expire and the making of lamps, so far as this patent is concerned, will be public property.

THE RESISTANCE OF METALS AT LOW TEMPERATURES.—The *Philosophical Magazine* for October contains a preliminary account of some highly interesting investigations by Professors Fleming and Dewar on the electrical resistance of pure metals and alloys at exceedingly low temperatures. Measurements were taken at temperatures ranging from the boiling point of water 100° C. to the boiling point of oxygen 182° C. The most striking fact elicited by this research is the enormous decrease in specific resistance experienced by perfectly pure metals when cooled down to these abnormally low temperatures. Thus the specific resistance of copper at the boiling point of oxygen is only one-sixteenth of what it is at the boiling point of water and that of iron is only one-twenty-third. The results plotted out as curves (temperatures, ordinates, specific resistances, abscissæ) go to show that at absolute zero the specific resistance of the pure metals is in all probability absolute zero also. The low temperatures employed were also very sensitive detectors of impurities. For instance, two samples of nickel, one nominally pure, and the other so in reality, both exhibited much the same specific resistance at 0° C., but at 182° C. the pure specimen gave the figure 1900 C. G. S. units, while the impure article gave 6737. In the case of alloy, the curves, which are approximately straight lines, show no tendency to pass the origin at absolute zero. When the alloys are compounded of chemically dissimilar metals, such as platinum-silver, the deviation from the vertical is slight. On the other hand when the constituents are chemically similar (platinum-iridium) the deviation is more pronounced resembling that of impure metals. Another fact of interest elicited by Profs. Dewar and Fleming is that down to 182° C., at any rate, carbon continues to behave as an electrolyte; i. e., the colder it is the higher is its specific resistance. Experiments are now under way on selenium, sulphur, antimony, arsenic and various insulators.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

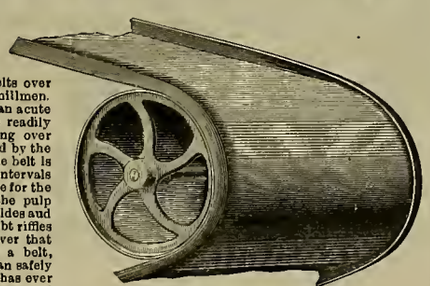
WE ARE ALSO MANUFACTURERS OF THE

'STANFORD," "TULLOCK" AND "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.



First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp in the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

Cleveland Carries the Country.

The Presidency, the Senate and the House of Representatives Go to the Democrats.

Cleveland has swept the country. Besides the solid South, he has carried New York, Illinois, Connecticut, New Jersey, Wisconsin, and probably Indiana, Ohio, Wyoming and California. Involved in this success is the next Congress, which will be Democratic by from 65 to 100, and the next Senate, which will be Democratic hy a majority of from five to ten. In those States which remain steadfast for the Republican party, the majorities are elsewhere reduced. It is, in fact, a tremendous landslide, an overwhelming defeat for the Republican party.

Colorado, Kansas and Nevada will cast their electoral votes for Weaver, but in Oregon and North Dakota, where he was supposed to be strong, the advarse vote was decisive. As yet (we write Thursday P. M.), we have only general reports from the several States and cannot, therefore, giva definite figures.

In California the count is not yet complete. At 4 P. M. Thursday, 1477 precincts report 99,738 votes for Clavaland, 97,869 for Harrison and 17,805 for Weaver. Tha Prohihition vote is not given. It is probahle that Cleveland has carried hy a plurality of from four to five thousand. In the First Congressional District, Geary (Democrat) is elected to Congress over Davis (Republican). There are as yet no returns from Modoc county, but exclusive of this county the district gives Geary 10,539, Davis 6955 and the Peopla's Party candidate 475. In the Second District Caminetti (Democrat) is elected. Incomplete returns give him 15,715 to 13,012 for Davis (Repuhlican), and 23 for the People's Party candidate. In the Third District, English (Democrat) has 11,232 while Hilborn (Repuhlican) has 11,172, and Lyon (People's Party) has 2785. A partial count in the Fourth District (San Francisco) gives Maguire (Democrat) 11,385, Alexander (Repuhlican) 10,186, Burman (Peopla's Party) 1295. Incomplete returns from the Fifth Distnct indicate the election of Loud (Republican) by a narrow msjority. In the Sixth District, Cannon, running as the candidate of tha Democrats and of the People's Party, carrias the district by nearly 5000 majority. In the Seventh District, Bowers (Republican) is elected by a narrow plurality. It is still too early to estimate the complexion of tha Legislature, but it is probably Democratic, and will therefore elect a Democrat to succeed Felton in the United States Ssnate.

In San Francisco the count is very tedious, but the indications are that Ellert, the Non-Partisan candidate for Mayor, is elected hy a narrow plurality. Scratching was universal among residents of the city, and the result is so mixed that naither party will be ahle to claim the administration. The Democratic vote was broken up and scattered among a multitude of candidates, hnt on those names where it was united, it showed a majority over all of ahout 7000.

For the first time the Australian Ballot System was used in this State and with very general satisfaction. While it puts the voter to some little inconvenience, it is a bulwark of defense against fraud and brihery. It is perhaps natural in view of this fact that those whose interest lies in the corruption of politics should inaugurata a savage warfare against it.

The bearing of Mr. Clevéland in victory and of Mr. Harrison in defeat has been alike dignified and in perfect tasta. In rasponse to congratulations, the President-elect has spoken briefly and modastly, while Mr. Harrison has gone ahout his official business as if nothing unusual had happened. There was no trace of disappointment in his appearance or speech. He has already declared his purpose of returning to Indiana after his official term, but will, perhaps, spend some months in Boston as the guest of his daughtar, immediately after leaving the White House.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, Nov. 5: The Zeils shut down on Tuesday for repairs. It is proposed to repair the shaft, hoist and mill thoronghly. The work will take two or three months. In the meantime a large nnmber of minars will be laid off Tha mining interests around Plymouth are starting up again. San Francisco parties have taken hold of the Osceola mine and are ready to let a contract to run a 300-foot tunnal. Tom Bawden's claim, sonth of the Bay State, has been bonded by Dr. Boyson, who intends to sink a shaft and thoroughly prospect the ledge. The first shipment of bullion from the Bay State mine was made on the 25th of October. Three hnndred tons of rock crnshed in the Plymonth mill returned $1913 in gold, and yielded five tons of sulphurets which produced $421, making ths rock average $7.78 per ton. A contract has bean let to Knight & Co. of Sutter Creek for a hydranlic engine and pump with a capacity of 300,000 gallons in 24 hours. Work on the plant is being pushed forward as fast as possible, and when complete, sinking and drifting will be inaugurated.

SUTTER CREAK.—Everything in connection with the mines is steadily improving, and is already in excellent shape for the winter. The teams ara nearly through hauling material, and if the rains were to come there would be no damage dona. At the Hector tbs entire mill is kept running steadily and no doubt expenses are mors than bsing paid. The Wildman mill is also being run to its full capacity, and everything is on a good paying basis. The air has somewhat improved since the new air blower has been put in, although there is great complaint among the men yet. The Belmont is still being run in the same manner, and they are anxions for heavier hoisting power. Mr. Tibbitts is very sangnine that they have one of the best paying mines in the county, but need proper machinery to enable them to keep the water ont and develop the property. Things at the South Enreka are about ready for sinking, and in my next I expect to be able to report considerable headway in this direction. Knight & Company have all the business on hand they can possihly attend to. The shop is foll of work, and an additional force of men is being put on occasionally.

Butte.

PAOGRESS AT FOABESTOWN.—Oroville *Register*, Nov. 3: Superintendent Stont informs us that the 40-stamp mill on the Stow mine is now ready for operation and that it was the intention of the manager to start it up this week. Twenty stamps have been running for a long time past, bnt 20 new ones have now been added to the mill, making it one of tbe largest in the npper part of the State. The chlorination works of the Shakespeare mine will be ready for operation early this month. It is said these works have cost $30,000. An immense quantity of material has been shipped from here, inclnding machinery for pumping and hoisting and some 10,000 pounds of acid. The hotels are all crowded and business of all kinds is very lively.

BROWN HILL MINES.—James Wheeler was down from Brown's Hill last week and says the mines there are very promising. In the Wheeler mine the tunnel is now in 740 feet, with gangways across tha lead, each 50 feet. The tunnel is timbered with a set of posts every four feet. The gravel is very rich, and be thinks from what tests they hava made that it will average from $7 to $15 to the carload. They have a large quantity ont bnt will not be able to wash any of it till the winter rains set in. Willett & Richardson are opening a gravel mina on a high bar near the river, and to obtain water have dug a ditcb one and a quarter miles long. He is confident they hava a good mine. Willett has one of the most promising quartz lodes in tha State, but lacks the money to develop this as it should be. He has a tnnnel in 320 feet and has sunk upon the ledga to a depth of 60 feet, and finds the deeper he gets the richer the quartz is. Willett himself is confident that he has soma of the best quartz ever found and thinks portions of the lode will go $1000 to the ton. The prospects in the Cascade mine, owned by Messrs. Higgins, Perkins and the Wilcox brothers, are good. This mine has been prospected for a number of years, but looks now as though the owners would be well rewarded. Wolters brothers, of Gibsonville, have for a nnmber of years been running a bedrock tnnnel at immense expense, to reach a rich vein of gold-bearing quartz, and have at last tapped it and will this month begin operating their mill. They are in with their tunnel over 700 feet and have sunk upon the lode over 300 feet. The rock is good and the returns will soon begin to come in. There are 60 or 70 miners at work in the vicinity of Cascade and Brown's Hill. Some are trying to develop mines they have found and others are searching for new discoveries.

A GRAND FUTURE.—Daniel Streeter, of Biggs, and W. W. Will, who is connected with the Bishop mine at Bangor, were discnssing the mining outlook for that section of the county. Mr. Will believed that mining there was only beginning and that the old channels stretched over a big scope of country. Ha was confident that in a few years there would be a continuous line of mines from Feather river to Bangor. In this Mr. Streeter fully agreed and said that some miles below Bangor young Mr. Newbert had found excellent gravel that would pay from $8 to $10 to the man. This gravel is nnlike the blue, hard, cemented gravel ahout Bangor, it being a whiter color and there being less cement in it. The bed was extensive, stretching over several miles, and he was confident that it would pay well. Mr. Will said that the quartz mines about Hurleton were attracting much attention and he was confident that inside of a year a great deal nf work would be done in that section. Both gentlemen considered that mining was only in its infancy, so far as Forbestown, Bangor and Hurlstou are concerned.

THE MOANING STAR MINE.—Oroville *Mercury*, Nov. 5: The stockholders of the Morning Star mine announca themselves as being very well pleased with the prospects which their venture is holding out. The mine is down now 80 feet, and 30 feet of this is through blue gravel, says the *Appeal*. Two crews of men for night and day shifts are employed and the work is progressing rapidly. The Morning Star is located near Bangor and the majority of the stockholders are residents of Marysville.

Mono.

THE ELECTRIC PLANT.—Bridgeport *Chronicle-Union*, Nov. 5: The machinery for the Standard Con. electric plant passed through town on Monday last. It is to ba hoped ths weathar will continua good, that there will be nothing in the way of the early completion of the works. The 1st of December will probably see tha mill of tha company running by electric power, making quite a saving for the company, and enabla it to work lower-grada ores.

Nevada.

GOON CLEANUP.—Grass Valley *Telegraph*, Nov. 3: Messrs. Faucett and Thompson, who ars working on the Norambagna ledge, have just completed a crushing of 23 loads of ore from the upper tunnel of the mine, and the resnlt was a yield of about $19 per load. The mine is owned by Wm. Campbell of this place and tha property is certainly very valnable. Messrs. Faucett and Thompson will do considerable work on the mina, aud in the spring Mr. Campbell will have a mill put on the property.

MINA BONNEN.—A. W. Stoddart has bonded the William Tell mine from James Roach and Mr. Tonella. The Wm. Tell is located on Osborn Hill and adjoins tbe Conlin mine. There has been considerable rock taken from the Wm. Tell, and very much of it bas been very rich. It is the intention of Mr. Stoddart to begin work within a few days.

CONTRACT LET.—The company working the Hermosa mina has let a contract to James Jenkins and George Ellis for running 50 feat of drift on the 200-foot level. The above-named contractors are among the best miners in the district, and they will do their work well. The prospects at the Hermosa are not at all discouraging.

STRUCK A GOOD LEDGA.—Nevada *Transcript*, Nov. 3: The Live Oak mine, in the vicinity of the Lime Kiln, is now getting in fine condition. The mina is owned by some Sacramento parties. Mr. Wm. Werry, the well-known mining man of Colfax, has charge of sinking the shaft, and he informs the *Telegraph* that he bas sunk 63 feet in the past three weeks. The shaft is a double-compartment one and is timbered in the best manner. The angle of the shaft is 45 degrees. There has been a ledge discovered at the depth of 60 feet, and it shows free gold all through. The country down there is lined with quartz veins of very larga size, and they are easily worked. The company now owning the Live Oak will erect a 10-stamp mill immediately.

A NEW CONCENTRATOR.—Nevada City *Herald*, Nov. 7: H. R. Edmands, of England, is putting in a new amalgamator at tha Providence. It is "Mnlloy's patent," and is designed to take the place of plates. The chief features are a shallow pan about four feet in diameter, containing quicksilver: A revolving disc is suspended abova the snrface of the quicksilver, between which the pnlp passes. The quicksilver is kept in a bright condition hy passing a light current of electricity through it. The Providence mill is now running 15 stamps.

IMPROVAMANTS AT THA CHAMPION.—Nevada City *Herald*, Nov. 8: The Champion Co. started up their new mill to-day. And it is virtually a new mill, for, besides putting in 15 new stamps, they have remodeled and raised the old mill, and done a great deal of work. The new stamps were on the right side of the old ones, and are set in an adjustable contrivance which permits of any single stamp being taken out without stopping the others. The plates in front of tha batteries are divided, so that one side may be cleaned up while the other is in use. A new and larga rockbreaker was put in for the new mill, also new ore-bins, and tbe whole apparatus was set up higher than the old mill. The old part was afterward raised to a level with the new, and solid foundations were then put under the entire building. All the foundation-work, timbering and iron-work pnt into the new mill is heavier than the old, and the building will not settle any more now. An extra waterwheel runs the rock-breakers independent of the other machinery, and the old Pelton wheel which used to run tbe stamps and concentrators has been replaced with a five-foot Dodd Sigmoidal wheel. Tbe waterpipe which supplies the new wheel in the mill is laid on concrete foundations, built from the bedrock up. The mill is now in first-class shape, and will handle all the ore the mine can produce. Numerous other improvements have been made under Superintendent Zeitler's management. The furnaces of the reduction works have all been rebuilt, and a concrete wall has been built aronnd the mill to keep Deer creek from making further inroads during the spring freshets. This wall alone was a big job, it being 25 feet high from the bedrock and very solidly built. This work has taken several months' time and has cost many thousands of dollars. In bnilding the addition to the mill, an excavation had to ba mada in the steep and rocky hillside, which was a big contract in itself. Two car-tracks were laid from the bank out into the creek, and the dump there shows that an immense amonnt of earth was taken out. The next improvement is to be a new hoisting works, which will be different from the old one. The cars will be raised to a higher track to get them on a level with the ore-bins in the mill. Ths hoisting works aloue will he a big job, and will reqnire a great deal of lumber.

Plumas.

LA PORTE.—Plnmas *National-Bulletin*, Nov. 3: The Claybank mins is pushing its tnnnel ahead. They expect to drive it 1000 feet farther. Tha famous Pioneer mine at Grass Flat is being opened up by the drifting process. Once it was very rich.

San Diego.

GOOD HOPE.—Los Angeles *Farmer, Miner and Oil Reporter*, Nov. 2: Though mineral was long known to abound in paying quantities in ths districts that surround Perris valley, it was not until three years ago that anything more than surface scratching and gophering was attempted. Then tha Good Hopa mine, in tha foothills four miles sonthwest of Perris, was bought by a company represented by James G. Sigafus. The property was simply a prospect hole. Sigafus put on a forcs of men nnder the direction of a practical miner and millman, and began sinking and developing. A cruds 5-stamp mill of ancient pattern was on the ground, bnt its capacity and capability wers not of a class to mill ths ore satisfactorily. The main shaft was snnk and ths mine opened with winzes and levels, showing by msasurement an ore body valued at $250,000. This was in February, 1891, and a Bryan mill of an improved style, capable of saving 90 per cent of tha ore, and witb a capacity of 25 tons a day, was put in. This has been worked continuously ever since, crushing on an average 10 tons of ore psr day. The ore is a grayish-wbite qnartz, most of it being decomposed, carrving free gold, tbongh sulphurets are found in paying quantities. It is easily worked, one shot releasing large amounts of rock, and it mills almost up to its assav valne. The ore, from the time it was first worked, has averaged $23 a ton, the cost of working being $5 per ton, leaving a net balanca of $18. An estimate of the ore in all the workings of the mine, places the amount at 75,000 tons, which at its assayed valua would be $1,700,000. Owners of the mine have refused $500,000 for it, it is claimed.

Sierra.

THISTLE SHAFT.—Cor. *Mt. Messenger*, Nov. 5: Here we found all as bnsy as bees, under the able management of Supt. C. B. Wingate, who is thoroughly developing this extensive and valnable mining property. Most of the snpplies for winter are laid in, and the balance are on the road to the mountains. Fifty men are employed. The Thistle shaft is connected with that of the Old Go-ahead (snnk hy Messrs. Clough and Lowell two or more years ago) by a substantial tunnel 500 feet in length, affording a good airway and escape, besides extra accommodation for lowering timbers. A new main tunnel is being run on a higher level to tap the naw workings ahead. Supt. Wingate is abont to do away with the old workings. Tha water is easily handled and breasts are perfectly dry.

Siskiyou.

SALMON RIVER.—*Telegram*, Nov. 8: The Bogundez mine is taking out and milling about $700 daily. The Ball mine has closed down preparatory to selling for $500,000. We ara informed that Mr. Daggett is now running his mill on $200 rock. The gravel mines on the high points are paying very handsomely. Morgan and Patterson, who made tha recent discovery on Eddys' gulch, have taken out about $3000, and have a very fine ledge, which varies in width from six inches to three feet. The road from Etna to Sawyer's Bar is about completed, being the best mountain road in the county. The bridge across Russian creek is about completed.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, Nov. 3: 1100 level—There has been extracted from all parts of the mine during the week 962 290-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $29.06 psr ton. The average assav valne of all the ore worked at that mill during the week, 980 tons, was $25.43 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $18,593.02.

OPHIR.—1465 level—The east crosscut (opposite west crosscut No. 2) from the drift rnn south from the Mexican into tha Ophir ground, 101 feet below tha sill floor of this level, has been extended during the week 8 feet; total length 21 feet; in a quartz formation of low assay valne. From this east crosscut we have worked north and have extracted and raised to the surface 25 tons of ore, the average assay value of which is $21.50 per ton.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift, has been extended during tbe week 28 feet; total length west from the joint shaft 2586 feet; face is in clay and porphyry.

UTAH.—340 level—The nortb drift from west crosscut No. 2 has been extended 20 feet; total length, 150 feet, continuing in porphyry, clay and quartz formation.

SIERRA NEVADA.—The intermediate tnnnel between tbe Cedar Hill drift and Kenosha tunnel has been advanced 20 feet; total length 92 feet; face in soft porphyry. We have saved from tha Cedar Hill drift 12 tons of fair-grade ore. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 28 feet, making the total distance west of shaft 2586 feet; the face is in porphyry.

GOULD & CURAY.—200 level—The northwest drift, started 435 feet from shaft, has been ad-

vanced 18 feet through porphyry and clay; total length 532 feet. West crosscut No. 5 bas been extended 14 feet through porphyry, clay and quartz; total length 71 feet. On the Sutro tunnel level, the joint north drift with Savage Company has been advanced 25 feet during tbe week; total length, 655 feet; face in porphyry.

ANDES.—On the 420 level, north drift from end of east crosscut No. 1 north was advanced 22 feet; formation clay and porphyry.

BEST & BELCHER.—900 level—West crosscut No. 2 has been advanced 10 feet through soft porpbyry and stringers of quartz; total length, 45 feet; also did some repairing on this level during the past week.

HALE & NORCROSS.—1800 level—During the week advanced No. 1 west crosscut 17 feet; total length 110 feet; face in quertz and porphyry. Work has been suspended in No. 2 west crosscut. West crosscut No. 3 was advanced 12 feet; total length, 80 feet; face in quartz and porphyry. Have resumed work in main north drift of this level, which during the week has been advanced 12 feet, making its entire length 222 feet; face in porphyry.

CHOLLAR.—We are repairing the west drift, 350-foot level and north drift, 450-foot level. The east crosscut, 160 feet south of north line, 930 level, is out 196 feet; face in porphyry.

POTOSI.—Have connected southwest drift 1850 level, with northwest drift from Ward shaft, which affords a good circulation of air between the shafts. Extracted and sent to mill the past week 326 800-2000 tons of ore from the 550, 980, 1150 and 1300 levels. Milled during the week 325 tons. On hand at mill 55 tons. Average battery assay, $25.18. Average car sample assay, $28 37.

BULLION.—The west crosscut from north drift, from top of raise from east crosscut, 320 feet south of north line, 1300 level, is out 42 feet; face in pornhyry and quertz that gives low assays. The northwest drift from 1800 station, Ward shaft, bas a total length of 1034 feet. At that point connection was made with the southeast drift from the Potosi winze.

WARN SHAFT.—The joint Alpha and Exchequer east crosscut on 1800 level has been advanced during the week 25 feet; face in hard porpbyry. The joint Potosi and Bullion northwest drift, 1800 level, has a total length of 1034 feet. At this point connection was made with the southwest drift from the Potosi winze.

ALPHA.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, has a total length of 76 feet; face in porphyry.

EXCHEQUER.—The joint east crosscut on the north line of Alpha, 1800 level of Ward shaft, has a total length of 76 feet; face in porphyry

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels we have extracted and milled 175 tons of ore of the average value of $18.20 per ton, as per battery samples. The Zadig drift, Sutro tunnel level, has been extended 24 feet; formation, soft porphyry.

NEW YORK.—Have resumed sinking the winze below the 650 level. It is now down 57 feet; bottom in low-grade quartz. Are taking out from 8 to 10 cars of ore per day, assaying from $20 to $30 per ton, from a two-foot streak above the 600 level. The west crosscut, 50 feet south of shaft, 650 level, is out six feet; face is in porphyry.

SILVER HILL.—Extracted and milled the past week 174 985-2000 tons of ore from the 160, 260 and 490 levels. Average battery assays, 16.46; average car-sample assays, $21.58.

Denver District.

STRIKES.—Grass Valley *Telegraph*, Nov. 5: C. C. Mandeville reports from Denver district, 30 miles south of Candelaria. He brings favorable reports from that section. Recently a number of strikes have been made going way up into the hundreds. A number of prospectors are in the district, and work on several promising claims is being done.

Kennedy District.

HIGH ASSAYS.—Grass Valley *Telegraph*, Nov. 5: C. C. Mandeville reports that in Kennedy district, in the East range, south of Winnemucca, ore is found that assays $120 to $140 a ton in gold.

Aurora District.

THE AURORA STRIKE.—Walker Lake *Bulletin*, Nov. 2: Work on the John Neidy mine in Aurora is progressing as fast as circumstances will permit. The ledge continues strong and the ore is improving right along. The ledge in the face is five feet between walls and there is three feet of pay ore, which averages about $35 per ton. There are now over 100 tons on the dump. The ore will be milled at the company's mill at Del Monte, and the returns will create great excitement in this vicinity. It is believed by old citizens of Aurora that this is equal to any of the big discoveries of former years, when that camp was the best bullion-producer in the State.

ARIZONA.

MOVING A MILL.—Mohave *Miner*, Nov. 5: W. D. McCright is moving his mill from Signal to the Groom's Peak country, where it will be erected and put to work on the rich ores of that place. There is a vast amount of ore in the vicinity of the new millsite too low in valnes to baul to the railroad that will pay handsomely in the mill. The famous Pittsburg mine in Chimebueva mountains has just been sold to Monaghan & Murphy of Needles, Cal. The purchase-price is unknown, but is understood to be up in the thousands. The mine, since its discovery, has been a heavy dividend-producer. The new owners will probably put on a large force of men and make large shipments of ore hereafter. Judge Schaefer has gone to White Hills to pay off his men. Since the sale of the big group of mines, the Judge has concluded to keep his present force of men at work on his individnal property, of which he has some of the best in that region. From now on we may look for renewed activity in mining in White Hills, as Judge Schaefer never does anything by halves. Thos. Gilbert went to Needles, Wednesday night, and from thence intends going to Gooff station, in company with two prospectors from the former place. They intend taking a complete prospecting outfit with them for the purpose of exploring the country in the vicinity of the recent gold discoveries, near Gooff, where Tom Gilbert is cognizant of several large gold ledges.

WHITE HILLS.—W. H. Hitchcock has gone to White Hills to pay off the men employed by himself and Sheriff Lake for some time past. Mr. Hitchcock has made a success of mining in the White Hills by using good judgment and by long experience in the mining regions of the West. Now that the mines are sold, he will undouhtedly turn his attention to this part of the county, where some really fine mines are known to exist. The new company will make many improvements in the method of working the mines at White Hills, as to work them successfully, machinery will have to be put on, boarding-houses and other buildings will have to be erected. There will be a hundred or more men put to work immediately in developing the properties and putting them in condition to stope out ore cheaply and easily. The purchasers of this large group of mines are successful Colorado mining-men, and they will make this venture a success in every sense of the term.

IDAHO.

A NEW SMELTER.—Idaho *Statesman*, Nov. 2: Judge J. W. Huston returned Monday from Mineral, where, in company with T. E. Logan, he has been making an inspection of the Black Hawk and Maria mines, belonging to the Maria Mining Company, in which both the gentlemen are heavy stockholders. Judge Huston reported the properties to be in excellent condition. But little work is being done at present, all the operations being brought to a temporary standstill by the recent burning of the Lang smelter. The judge said the work of constructing a new 80 ton smelter was being vigorously prosecuted, and that within four weeks it would be ready to handle the ores of the Black Hawk, Maria and other mines in the Mineral district. The smelter that was destroyed by fire was of but 30 tons capacity. At present there are only about 30 men employed in the camp, which force will be largely increased as soon as the new smelter is ready for business. The mines being worked in the Mineral district, besides those of the Maria Mining Company, are the Boom, Jeff Davis, Silver Bell and Egan.

WILLOW CREEK DISTRICT. — Anderson Cox arrived in the city yesterday from the Willow Creek district. He says the mines of that section are looking well. Locations are being made daily. Several large deals, involving some of the most valuable property in that district, are on foot, and will be consummated soon.

OREGON.

TO CORNUCOPIA.—Bedrock *Democrat*, Nov. 1: The breaking of the wire cable of the tramway of the Eastern Oregon Gold-Mining Company at Cornucopia, which occurred several weeks ago, thereby necessitating a suspension of operations of the mill, on account of being unable to get the ore from the Red Jacket mine to the mill, will soon be remedied, and operations will be going on in a few days as if nothing had happened. Yesterday six tons or more of wire arrived at the depot in this city from the East, and was at once loaded on teams and started for Cornucopia. The tramway will be repaired more durable than ever, and in a manner to withstand the heavy snows of winter. It is expected that the mine and mill of the E. O. G. M. Co. will be kept running without cessation from this time on.

NEAT CLEANUP.—The Hurdy Gurdy mine at Elkhorn mountain has surprised even the most sanguine expectations of its owners. Last evening Mr. N. S. Wight, the superintendent, arrived in town with a wad of bullion amounting to about $1400, the result of a little over four days' run with a Tremaine mill. This is a showing equal to the White Swan and will open the eyes of the Portland stockholders.

NEW MEXICO.

NOTES. — *Southwest Sentinel*, Nov. 1: The Bremen mill is running on ore from the Providentia mine in Chloride Flat. Bullion shipments have been resumed from the Maud S. mine at Silver creek. The alterations in the Peacock mill have been completed and work has been resumed on the mine. The new superintendent of the Jim Crow mine has commenced operations on the property. The company which purchased it recently will develop it thoroughly. The new shaft of the Solid Silver mine, at Black Hawk, is down about 60 feet. It is about 600 feet from the old shaft, and is being put down on an incline of about 70 degrees. It is not expected that the shaft will be completed before the end of next summer. A carload of very rich silver ore has been taken ont of the Alhambra mine at Black Hawk. The ore is as rich as that taken out of the mine by Miller & Dodd three years ago. The indications are that the mine will continue to produce very rich ore for some time to come. The Manhattan Gold-Mining and Milling Company's tunnel is now in over 600 feet. The manager expects to strike the main vein within the next 100 feet. The tunnel will strike the vein about 100 feet below the third level in the mine, and will give about 100 feet of stoping ground. The rock is very hard and progress in the tunnel is slow. The Brockman mill, at Lone mountain, cannot treat the ore which the mine can produce. The ore exists in such a large body that a few men could keep a mill of much larger capacity than the one now in operation going constantly. The ore-body is by odds the largest ever discovered in the Lone Mountain district, and will compare favorably with the largest ore-bodies in New Mexico.

SOUTH DAKOTA.

THE LARGEST YET.—Deadwood *Pioneer*, Nov. 2: The cleannp of the Golden Reward Chlorination Works for the last 15 days of October was completed yesterday with the exception of running it into a bar. The total amounts to nearly 1300 ounces, the largest amount yet produced by the plant in a like space of time, and the stockholders are correspondingly jubilant. The works are now treating 95 tons of ore every day and harrel No. 4 will be in place in a few days, which will increase the capacity to over 100 tons. The chlorination system was never worked under more satisfactory and encouraging results than at the Golden Reward, under the competent superintendency of M. Bamberger.

A PROMISING DISTRICT.—Deadwood *Pioneer*, Nov. 1: A district that bids fair to become a formidable rival to Bald Mountain and Ruby Basin is now receiving the attention of prospectors. It is in Two Bit, which has been worked in a desultory fashion for a number of years. Lately, men with money bave taken hold of some of the claims and have disclosed large bodies of refractory ore that is considerably higher grade than that found in the upper districts. Rus ell and Higby own 11 claims, upon which a body of ore seven feet thick bas been opened, which assays over $40 a ton in gold. Mining-men think that the proper contact bas been reached on these claims, and that intelligent prospecting will prove this as important as the most extensive district in the Hills.

WASHINGTON.

AROUND CONCONULLY.— Okanogan *Outlook*, Nov. 1: Harvey & Miller are doing development work on the Frankie Boy and other claims on Mineral hill for Nelson Clark, of Spokane. Jas. Robertson is working a force of men on the Lenora mine on Peacock hill. This is a fine large vein carrying a high-grade silver ore. The John Arthur mine was bonded last Saturday to a syndicate of eastern capitalists. The consideration bas not been made public, but we understand it is a good round sum. The sbaft on the Defiance mine, near Spectacle lake, is down 80 feet, and constantly improving. A force of eight men is employed on the mine, which is now owned by Everett parties, and Superintendent Pratt informs us that work will continue all winter. W. E. Hensley, one of the gentlemen who is interested in the Golden Fleece group of mines on Gold bill, passed through town yesterday en route to San Francisco, where he will spend the winter. Mr Hensley has been mining for 20 years, and thinks that the Golden Fleece is one of the most promising prospects he ever saw.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Nov. 10, 1892.

The week under review was largely interrupted by national and State elections, but now that the results are known, it is only a question of a few days before the country will settle down to its normal condition. There is no doubt but at the moment many bankers and financiers are borrowing trouble over the probable financial policy of the next administration. While this tends, for the time being, to promote a spirit of uneasiness which is calculated to foster a feeling of uncertainty, yet this will wear away, and by the time next Congress acts on the financial problem, its probable action will be largely discounted and no visible effect be discernible. This has been the history of all former financial legislation, and it is safe to say it will not differ in this case.

The local money market has moved along about the same as reported in our last review. Remittances from the interior have been fair, while the demand has been slow. There is an absence of speculation in all brenches of business, which tends to the accumulation of funds and to that spirit of caution which closely scrutinizes all propositions, however meritorious they may be. This spirit of conservatism is enforced by the uncertainty regarding the probable legislation on finance and also on the tariff by the 53d Congress, To this must be also added the near approach of the time for annual and semi-annual settlements. Banks and incorporated companies having funds out are drawing in more or less so as to provide for the disbursements which will be made during the first month in 1893, and to this can be traced much of the spirit of conservatism which pervades the market. The disbursements in this State next January, it is confidently expected, will be the largest within the history of this State, and until funds begin to find their way back to general financial reservoirs, the money market can be expected to work closely.

Eastern mail advices report continued activity in trade circles; not even the elections had any material effect. The increased and enlarging demands for manufactured goods are making themselves favorably felt, which would be felt more forcibly were it not for the elections, the near approach of the holiday season and the period for annual settlements. There does not appear to be any occasion for doubting that we have entered a new era of prosperity and that 1893 will witness more prosperous times than have obtained for several years. This opinion is well expressed by John H. Davis & Co., of New York, who rightly claim that there is no country on earth which presents to-day as many favorable factors in its business and financial condition as the United States. The crops of this year are abundant, and, owing to the unprecedented yield last year, the proceeds of this year's growth will not be used up in repairing deficiencies, but will give the producers a surplus for future uses. The railways of the Central States are clogged with wheat and corn, for lack of cars to move or warehouses in which to store the enormous tonnage offering. The statement comes from the Centrel markets that more than two-fifths as much wheat has come in sight already in this crop year as appeared in the entire crop year of 1891. The shipments of flour, grain and provisions from Chicago to the seaboard show a very large gain over the like time in last year. Our railways have an enormous traffic assured to them through the moving of the crops, the revival of the iron interest and the national activity which will prevail during all of 1893, by reason of the World's Fair in Chicago. The new railway construction for 1892 is likely to be less than for any other year since 1885. This is of double advantage—in the avoidance of a pressure of new securities for sale, and in giving to the existing lines the steadily increasing business of the country, which is gradually making hitherto unprofitable extensions self-sustaining. There is a growing and a gratifying purpose in the country to discourage unnecessary railway building, and also to require honesty in railway management. This demand for honesty in management appears to be extending to all incorporated companies, and when it is secured, then, and not until then, will the public operate as investors and not as gamblers, to which latter they have virtually been reduced by the high-handed course pursued by those in control.

SILVER—The market held to fairly steady prices up to yesterday (Wednesday), when there was a shading off in prices both in this country and abroad. To-day London telegraphs lower prices, as did New York. The decline is said to be due purely to manipulation and not to the result of the election. While saying this, it is quite generally conceded that Congress will repeal the present law which requires the purchasing of 4,500,000 ounces of silver bullion a month. From all we can learn, while it is generally believed the present silver law will be repeeled, yet it will depend largely on the action of the International Monetary Conference. There does not appear to be any reason for doubting that the Conference will

take favorable action looking to the more general introduction of silver as a metal currency, yet its action will not be binding, and until each country, provided the Conference acts favorable to bimetallism, ratifies the action of the Conference, silver will continue a stumbling-block and its market value fluctuate.

There was exported in bullion the past week to Japan $69,600.

MEXICAN DOLLARS—Exports by sea the past week aggregate $354,581 to China. The market has held fairly steady at around 68¾c.

QUICKSILVER—Receipts the past week aggregate 296 flasks. The market has held steady at pool prices.

BORAX—Receipts the past week aggregate 265 ctls, and exports by sea 4871 ctls to New York. The market has held steady, with no essential change in quotations reported.

LIME—Receipts the past week aggregate 2830 bbls. The market has been quiet at from $1.25 to $1.50 per bbl.

LEAD—The market has ruled barely steady. The demand is slow. Eastern advices indicate lower prices, owing to a selling pressure.

TIN—Plate shows more firmness, but pig is barely steady. English advices report a stronger demand from this country for plate.

PIG IRON—The market exhibits more strength, but any advance in sellers' views causes an offish feeling. The consumption continues only fair. Eastern mail advices report a firm market at another slight advance. English cables report a steady market.

COPPER—The market shows a fair degree of strength. English cables report a strong bear influence which causes a soft feeling. It looks as if the market is being shrewdly manipulated.

COAL—Imports the past week aggregate as follows: Coos Bay, 500 tons, Nanaimo, 1400; Tacoma, 6000; Seattle, 5412; Departure Bay, 2527; Newcastle, N. S. W., 2029. Total, 17,868 tons. The market does not show any material change, although for forward shipments stiff rates are asked. Importers are close students of the weather, and will govern themselves according to the prospects for plowing and seeding.

Mining Share Market.

SAN FRANCISCO, Nov. 10, 1892.

Mining shares the past week under review were not given any support by the mill rings, yet there were unmistakable signs that the inside bad their brokers taking in shares. Under such a dragging and slowly declining market outside, shareholders sold. By those in position to know, it is said that large lines of shares have been taken in by the inside, and as the points are still out "to let shares alone, they must go lower," very few of the shortsellers have filled, which, taken with what the bulls have sold, ought to give the rings all, if not more, of the shares that there are in several of the mines. If this is the case, there will soon be a reckoning for small short-sellers, and an attempt made to load up the public.

Operators should keep in view four very important facts, either of which, if ignored, is apt to cause financial losses. The points to be kept in view are: First, shares were never before so well concentrated, either by the mill rings or else by a strong money syndicate; second, reforms have been and are still being made in the extraction and milling of ore which are calculated to inure to the benefit of outside shareholders; third, the importance of the work which has been done; and, fourth, that much more work will, it is said by mining men, have to be done before some of the mines are in the best possible condition for economical working and being placed on a dividend-paying basis. This necessarily means large expenditures of money. Another thing should not be ignored, and that is, about all the important work in the Comstock mines is toward the West or Red lode, which is claimed by other companies, and that sooner or later litigation will be the order of the day. While suits at law may not be instituted for some time, yet they will surely come, for the owners of the west side mines will not sit idly by and see their ore extracted and milled by other companies. A concentration of shares by mill rings or a moneyed syndicate is *prima facie* evidence that a deal will be attempted so as to unload at a profit; and this being the case, it will necessitate, on the part of outside shareholders, the exercising of great caution so as not to be caught with shares when the market is advanced, for when top prices are reached there will be another decline of from 50 to 80 per cent—the former on shares which did not move up much and the latter on those which made the largest advance. How high the market will be advanced each patron must be the judge, but it is a safe proposition to sell when a profit is in sight and then keep out, for it is only a question of time when prices will go down, carrying the bulls with it.

Last July at the time when nearly every person was a bear, we predicted a deal, but warned outsiders of a break of from 60 to 80 per cent when top prices had been reached. Time proved us correct and time will again prove us correct in the assertion that when prices on the coming deal reach top, there will be a break of from 50 to 80 per cent. The break will come when the rings have sold all they possibly can and are forced to send prices down so as not to buy shares from large, moneyed short-sellers—it takes too much money to buy when the market is well up.

The share market opened this (Thursday) morning weak and inactive. After the regular Call there was a slight advance in the shares of the mines reported to be controlled by Mackay and Flood, under the lead of Hale & Norcross. From Chollar south there was no improvement, only a slightly steadier tone in sympathy with the advance in the shares of the former mine. The improvement in the shares of Mackay and Flood mines, is, no doubt, largely due to a rumor that these two gentlemen have secured the interest of Senator J. P. Jones and his brother Sam in the mills in which they were interested. While we are not in position to affirm or deny the report, yet we can unhesitatingly say that the change would give unqualified satisfaction. In saying this it must still be understood that we are of the opinion that there will not be a stable share market until the mills are turned over to the mining company, and all bullion produced given to the respective companies from which the ore was extracted. Until this is done, dealing in shares will be risky and a losing game to the person who waits for big things.

There appears to be a dearth of news from the Comstock mines. Even usually well-informed and reliable persons say that they have nothing new to report, and probably would not have until after the present week. This, they state, is due to the election taking precedence. From our own source of information we learn that very important work is under way in the three different groups of mines, and that a secret lightning drift is being run. Why this is kept secret and why it is being pushed with all the speed possible, it is hard to say, but it is safe to affirm that there is some kind of scheme back of it. The west crosscuts which are being run in Hale & Norcross and several other mines are expected to run into good milling ore within the next two weeks. Profound ignorance is manifested regarding the work in Belcher, Crown Point and Yellow Jacket. Probably this is done to induce buying, for if good news was given out the public would "cappper" it, as experience has made operators doubting Thomases. The car sample assays reported the past week, show an increase in value. Con. Virginia's monthly statement shows a very large proportion (about 75 per cent) of gold. Other bullion-producing mines are said to be showing a steady increase in the percentage of gold.

Eastern Metal Markets.

NEW YORK, Nov. 9.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38 15-16	81½	11 65	3 80	20 70
Friday	39 1-16	83¼	11 65	3 80	20 70
Saturday	39½	8 3	11 65	3 85	20 70
Monday	39 1-15	85½	11 65	3 90	20 70
Tuesday	39 1-16	....	....	....	....
Wednesday	38⅞	84½	11 55	3 80	20 60

Quicksilver is steady. Pig tin is dull and heavy, but plate is firm. Lead is weak. Copper is inactive but steady. Pig iron is firm.

SACRAMENTO ELECTRIC POWER COMPANY—Capital stock, $1,500,000. Directors—Albert Gallatin, A. J. Ralston, Horatio P. Livermore, Charles E. Livermore and Joshua Barker. The company proposes to furnish light and power to the inhabitants of Sacramento, and also to construct a street railroad to run from the passenger depot of the Southern Pacific Company to the eastern boundary of the city. The estimated length is 16 miles.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 1, 1892.

485,526.—CARBURETOR—Dan'l Best, San Leandro, Cal.

485,530.—BOX-NAILER—Jas. A. Cain, Markham, Cal.

485,178.—SURGICAL SPLINT — E. Densmore, Coronado, Cal.

485,497.—AXLE-NUT—John Gambetta, Stockton, Cal.

485,345.—ICE VELOCIPEDE — M. B. Gibson, Ukiah, Cal.

485,193.—DREDGING IMPLEMENT—John Hatch, S. F.

485,582.—FISHING FLY-HOOK — D. K. Howe, Portland, Ogn.

485,596.—WATER-WHEEL—C. W. Huson, Nevada City, Cal.

485,501.—ORE-FEEDER—E. A. Langford, Grass Valley, Cal.

485,421.—GOPHER-TRAP—Geo. Moor, Lafayette, Ogn.

485,213.—JOURNAL-BOX — J. Q. Nyquist, Tacoma, Wash.

485,477.—WATER-WHEEL BUCKET—J. B. Pitchford S. F.

485,562.—RAILWAY CAR—T. E. Pope, Oakland, Cal.

485,428 —CONCRETE-MIXER — E. L. Ransome, Oakland, Cal.

485,430.—FAUCET—W.W. Riner, Los Angeles, Cal.

485,237.—CABLE-GRIP — P. T. Taylor, S. F.

485,242.—PIPE-MAKING MACHINE—W. A. Tipson, S. F.

485,517.—ROCK-CRUSHER—G. W. Weller, Baker City, Ogn.

21,952.—DESIGN FOR SPOON—Bates & Quimby, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAS-ENGINE MOTOR FOR CARS.—Daniel Best San Leandro. No. 484,728. Dated Oct. 18 1892. This invention relates to a gas-motor which is adapted especially to drive cars. It consists of two oppositely placed cylinders, the connecting-rods from the pistons of which act upon the same crank. Intermediate gears and pinions transmit the power of the engine-shaft to the car-axles and enable the operator to reverse the travel of the car and make it run in either direction, without reversing the engine. A peculiar frictional clutch allows the driving mechanism to be connected with or disconnected from the car, and the power to be applied gradually. A novel means for supplying the gasoline vapor to the engines is employed, and the exhaust is led above the roof and muffled so that there is little or no noise and no odor.

MANUAL CASH RECORDER—Hermann Kiehl of Halle-on-the-Salle, Germany, assignor to Jesse Meye field, S. F. No. 484,742. Dated Oct. 18, 1892. This is one of that class of cash-recorders in which a moving paper, upon which the amounts received are to be written, is employed as a check and confirmation of the amounts deposited in the receiver. It consists in a box having within it a tilting tray adapted to receive the money and observable through a sight aperture in the box and mechanism within the box operated by a handle or lever from without for tilting the tray. The invention consists also, in connection with the box, of a movable strip of paper mounted therein and observable, and its surface accessible from without, a tilting-tray within the box observable through a sight-aperture, an opening by which the money is passed to the tray, and a suitable mechanism for tilting the tray and advancing the paper. The object is to provide a cash-recorder in which the coin or other money deposited in the receiver shall lie temporarily in full sight of the customer, and in which a check or confirmation is provided by means of the traveling paper upon which the clerk is required to write the amount which he has deposited in the tray.

FEEDER FOR BALING-PRESSES—John H. Kruse and Milton K. Shipley, Oswego, Or. No. 485,045. Dated Oct. 25, 1892. The invention relates to that class of feeding mechanisms for baling-presses and other machines in which movable rake-arms are employed to engage and advance the material. It consists in the novel construction and arrangement of the rake-arms, the novel mechanism for operating them, and the table in connection with which they operate. The object is to provide a simple and effective mechanism especially adapted for feeding material to baling-presses, but also useful in connection with the supplying of material to other machines.

EXCAVATOR.—Henry P. Bennett, Phœnix, A. T., assignor of one-half to S. C. Symonds. No. 485,084. Dated Oct. 25, 1892. This excavating or ditching machine consists essentially in a plow, a rotating-wheel provided with elevating-buckets, which receive the material from the plow and carry it upwardly, and a swinging or vibrating discharge-shovel to receive the material from the elevating-buckets and throw it to one side.

BITUMINOUS-ROCK-REDUCING MACHINE.—Samuel P. Hall and James W. Wood, Oakland. No. 484 735. Dated Oct. 18, 1892. This is a machine which is especially designed for pulverizing and preparing bituminous rock to be used upon streets and roadways and for the preparation of surfaces generally. The object of the invention is to provide an apparatus in which asphaltum in lumps is prepared and finally reduced, crumbled and pulverized to a sufficient fineness to be employed on streets, etc.

GAS ENGINE.—Daniel Best, San Leandro. No. 487,727. Dated Oct. 18. 1892. The invention relates to certain improvements in engines which are propelled by the explosion of an inflammable vapor or gas, and in which the piston moving in the engine-cylinder first serves as a pump to draw a charge of the explosive gas or vapor into the cylinder, and after returning to compress the vapor in the end of the cylinder is again propelled to the opposite end of the stroke by the ignition and explosion of the confined vapor. The patent covers certain details of construction, especially in the igniting device and the valves. The speed of the engine may be regulated with great nicety, so that it runs very steadily. As to the igniting device, it has been found that the best results of a gas engine are produced when the explosive mixture is ignited at the instant of greatest compression, and as the crank passes the center nearest the cylinder and the piston is ready for the outward stroke. If the piston starts on its stroke before the ignition, the compression is reduced and loss of energy is observable. The construction devised by Mr. Best is such that no amount of longitudinal extension or contraction by heat of the electrical ignition will alter the time of making the spark and the explosion of the charge.

Testing and Working Silver Ores

A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Ohilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

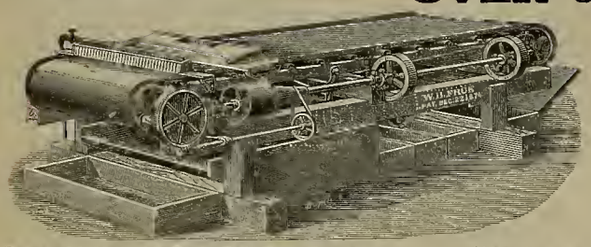
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Youre faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.

The Caminetti Hydraulic Mining Bill.

The resolutions adopted by the State Mining Convention indorsing the Caminetti bill need little explanation. Only two amendments are suggested. One is to expurge the word "must," put in by Senator Felton, and substitute the word "may," as contained in the original bill. The object of this is to leave out such hydraulic miners as can carry on work without the interference or assistance of the U. S. Engineers. The bill as it stands provides that those who want to hydraulic *may* file with the Government Commission a verified petition to mine. Senator Felton wants the bill to say they *must*. This would make the hydraulic miners in Trinity and Siskiyou counties come under the provisions of this law, which is not necessary, and which they naturally object to. Their debris tails now into the Klamath — a non-navigable stream—and so into the ocean, injuring no rivers or farming lands.

Again, in other places, mines are being worked which do no injury, and which have never been enjoined. Unless the word *must* is kept out of the bill, all these people will be brought under its operation.

The proviso sought to be added is: "Provided, that this act shall not be so construed as to prohibit the carrying on of any mining operations prior to the construction of said dams which can be conducted without material injury to the navigable streams of the State or lands adjacent to said streams." The object of this is plain enough; not to stop men from mining who can now do it without injury.

It is recommended that an appropriation for building the dams be asked for. This would come in due time, probably, if the bill passed both houses, since it would be necessary to make the act operative.

The resolutions with reference to this bill, adopted by the Resolution Committee, were also adopted without opposition by the convention. There was not a voice raised against them. But later in the day a motion to reconsider the subject was made, which gave rise to rather an acrimonious debate.

The matter was finally settled, however, as originally proposed, by refusing to reconsider the resolution. The opposition to the bill was on the part of a few miners only, but they were vigorous and earnest in the matter. The great bulk of the members of the convention, however, were in favor of the bill as the best that could be obtained. They all recognize that it is not exactly what they want, or even what Mr. Caminetti himself wants, but there is no chance of getting anything better for the miner. When the ayes and noes were called for on the motion to reconsider, there was such a shout of "no" that there was no use in calling the roll. The bill was endorsed by the convention by a practically unanimous vote.

The Miners' Association Banquet.

In the evening, after the adjournment of the Miners' Convention, the delegates met in the Maple room of the Palace Hotel at a banquet. Mr. Neff presided and Louis Glass acted as toastmaster of the evening. The toasts were as follows: "The President of the United States," by John F. Davis; "The Governor of California," by State Mineralogist Wm. Irelan Jr.; "The California Miners' Association," by Alf. Tregidgo; "Hydraulic Mining," by Senator-elect T. E. Ford; "The Judiciary," by C. W. Cross; "Mining Department of the University of California," by Prof. S. B. Christy; "The MINING AND SCIENTIFIC PRESS," by Chas. G. Yale; "City of San Francisco," by Judge J. A. Waymire; "Electricity, the Coming Power," by Prof. N. S. Keith; "The Ladies," by D. D. Bowman; "The Press," by E. B. Price (of the Oroville *Mercury*); "The County Miners' Associations," by W. G. Hodson (of Shasta).

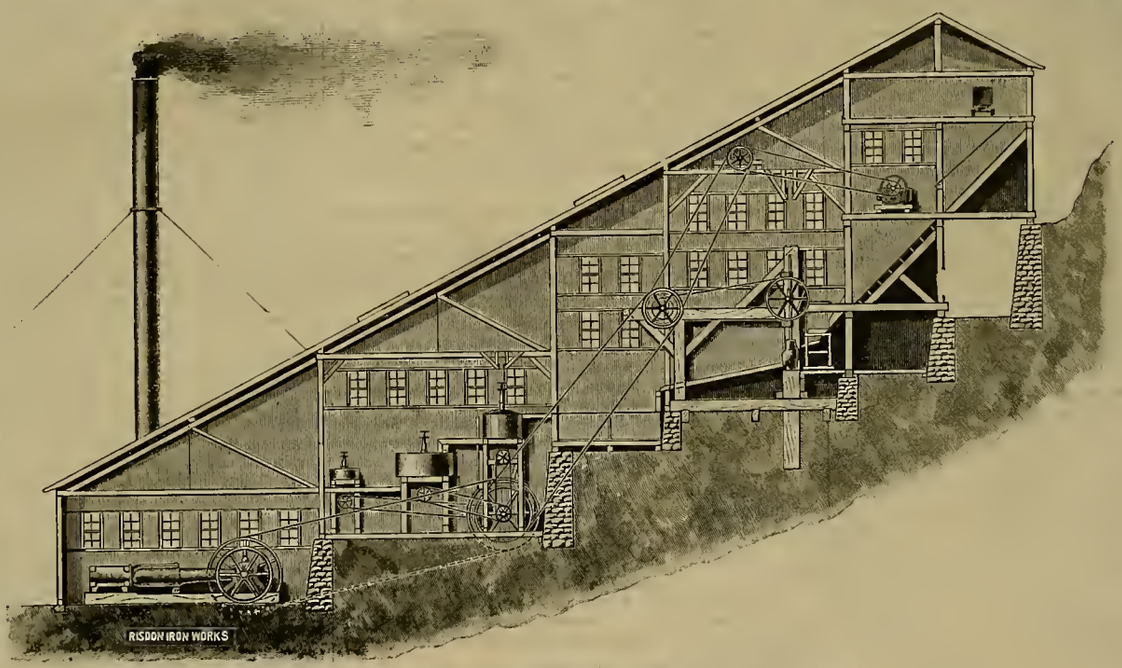
The speech of Mr. Davis, in responding to the first toast of the evening, was a particularly happy one, well delivered. Mr. Ford delighted his friends by his eloquent remarks; and Mr. Cross brought encouragement to miners by what he said about the judiciary. At the close of Mr. Fredidjo's address, after referring to the secretary of the association, he proposed a toast to the memory of W. C. Ralston, which was drunk standing.

The MINING AND SCIENTIFIC PRESS was complimented by being called as one of the regular toasts, and spoken of as the steadfast friend of the miner and the mining interests. The editors and publishers are pleased to note this mark of appreciation.

IT IS announced that the principal mine in the White Hills, A. T., has been sold to R. T. Root and C. W. Barry of Denver for $250,000. Judge Henry Schaefer gets two-thirds of this and the remainder goes to Wm. B. Lake.

Wet-Crushing Silver Mill.

Free-milling silver ores pass through the same process as gold ores, until the battery is reached. Then the amalgamating plates of the gold mill are omitted, and the pulp flows from the batteries in sluice boxes to the settling tanks, usually arranged in rows between the batteries and pans. Various sizes and patterns of pans are used for grinding and amalgamating, usually one 5-foot pan for two stamps. These pans are arranged in a row, allowing a narrow platform between them and the settling tanks. The settlers are located immediately in front of and about four feet lower than the pans; one settler to two pans. The capacity of a 5-foot pan is from 2000 to 3000 pounds per charge, and each charge requires four to five hours treatment in the pans. When the pan is charged, water is added to reduce the pulp to the proper consistency, the chemicals are then added, the muller lowered, and the grinding takes place during the first two hours. The muller is then raised and the quicksilver added, changing the pan from the grinding to the amalgamating period. Amalgamation then continues for three hours. The pans are usually provided with steam chambers, where either live or exhaust steam is used to heat the charge to the proper temperature, which must not be so great as to vaporize the quicksilver.



SIXTY STAMP WET-CRUSHING SILVER MILL, TANK SYSTEM.

When the time to draw off the amalgamated pan charge arrives, an empty settler is ready to receive it. The charge flows to the settler, which is much larger than the pan. Enough cold water is added to fill the settler, thus reducing and cooling the thick hot pulp to the condition best adapted to settling. The speed of the settler is so regulated that the pulp is barely held in suspense, while the greater specific gravity of the amalgam causes it to settle to the bottom, where it remains until drawn off at the pleasure of the amalgamator. The settling of a charge is accomplished in half the time it requires in the pan, consequently one settler serves for two pans. After settling is complete, the charge is drawn off at the series of discharge nozzles, commencing at the upper one and continuing downward as the charge recedes, always leaving the portion containing the amalgam in the settler. The amalgam is then strained, the quicksilver is elevated to the pans, and the amalgam retorted.

The water flowing from the settling tanks frequently carries slimes with it, which are often valuable, in which case they are settled in reservoirs, dried and amalgamated separately.

The cut on this page shows a sixty stamp wet-crushing silver mill, on the tank system, as planned by the Risdon Iron Works, of this city.

MINING SUMMARY.—From the Various Counties of California, Nevada and other Pacific States and Territories, 341-342.

Where the Money Went.

Upward of $14,000 was collected by miners after the formation of the State Miners' Association, for the purpose of furthering their interests. This money was contributed by firms and individuals. The main necessity was to send a delegation to Washington to urge the passage of measures which would permit the resumption of hydraulic mining in this State. Most of the money was spent in this direction. It will be necessary, doubtless, to send some one to Washington during the coming session of Congress to guard the interests of the miners, until the final passage hy both Houses of the pending bill. Where the money came from and how it was spent is shown by the following financial etatement of Secretary Ralston:

RECEIPTS.

San Francisco county	$7,405 33

MR. GEO. OHLEYER, the great antidebris agitator, who wanted to be elected to the Legislature so as to prevent the miners obtaining any recognition in that body, w as defeated in his district. There is a change in public sentiment on this subject, as Mr. Ohleyer has now doubtless discovered.

THERE were more representative miners of California in San Francisco this week than have been seen since the convention of last January. They came from all the mining counties, and were glad of the opportunity to meet each other and discuss the mining situation.

CONGRESSMAN GEARY, who has been reelected to Congress, is friendly to the mining intereats and an influential member of the California delegation.

AT the last meeting of the supervisors five street-railroad franchises were asked for.

Proceedings of the Miners' Convention.

What was Done by the Miners During Two Days Session.

The State Miners' Convention was called to order in Pioneer hall on Tuesday afternoon hy J. H. Neff, president of the State Miners' Association. The hall was well filled, but there were not as many delegates present as on the occasion of the convention in January last. The valley counties were not represented this time, although invitations had been extended for delegations from those counties. Under the rules of the association, each county organization is entitled to one delegate to the convention for each ten members. This naturally cut the delegations down numerically, since on the former occasion there was practically no limit. Nevada county sent the largest delegation this year, but Sierra and Placer showed up well also. The lists of delegates are given in another column.

Chairman Neff, on calling the convention to order, explained that, while the constitution provided for the convention in October, the executive committee had deemed it prudent to postpone until after the election, so that politics might be kept out of the deliherations. He then explained that the last convention selected five gentlemen to see and if possible instruct our representatives in Congress on the issues so vital to us and to California. This movement proved to be a good one. They carried on a campaign of education, for there was much ignorance on the subject and much prejudice to disperse. The matter required the constant time and labor of the delegates, and finally a bill was passed ih the lower House, for which thanks are due to those who supported it. Now there is a bill pending in the United States Senate. A copy of this bill would be referred to the committee on resolutions, whose members were to deliberate whether the bill will be for the real interests of the mining industry or not. Mr. Neff reminded the convention "that this campaign is not a campaign against our neighbors of the valley. If hydraulic mining is against the agricultural interests, it should not be fostered to that extent. We think that it is not, and that there is a way and means by which right and justice can be done to both. We think that there is sufficient skill in the engineering departments of the country to solve the momentous questions and issues involved."

The preliminaries of business were soon arranged, and the necessary committees on credentials, resolutions, ways and means, etc., appointed. These will be found elsewhere in this number of the PRESS. As they were about to adjourn, it was found that Senator Stewart of Nevada, who had been invited, was in the hall, and he was led to the platform by Chairman Neff and addressed the convention. He concluded by directing attention to the silver question, using the arguments which have from time to time been published from his utterances in the Senate.

At the conclusion of Senator Stewart's address, Senator Meade of Sierra county suggested that it was important to know something about probable State legislation. The miners should know what kind of legislation it was proposed to have at the next session, for the State legislation was just as important as the national. The speaker said that he for one would like to hear from the members-elect to the Legislature about their position on the mining question and what they proposed to do. If they had not formulated any opinions the convention would assist them.

This idea was not very well received by the convention, and after a brief but earnest speech opposing it hy Judge Searles the subject was dropped as savoring of "politics."

The chairman, seeing Congressman Caminetti in the audience, asked him to address the convention. Congressman Caminetti responded with a few remarks, stating that he was ill and his family was sick, which fact would prevent him from participating in the deliberations of the convention. He said he had tried to do the best he could for the miners at the last session of Congress, believing that his course represented the opinions of his constituents. He notified the members that he had nothing to suggest and nothing to dictate on the suhject, but would do everything to profit by the result of their deliberations. He would devote all of his time and energies toward solving the momentous question. Congressman Caminetti also said that he had been delegated by a Congressional committee to investigate the suhject of titles to lands in mining districts and also to those lands comprehended under tbe railroad grants. He hoped the convention would investigate the subject, as much depended on it for the people.

Among other things, Mr. Caminetti said: "I am here as your servant to obey your instructions and do all in my power to assist in the interests of the people of California, and to rehabilitate the hydraulic-mining industry if it can he done without injury to any other interest. I do not claim that my bill is perfect. It is the best that could be done under the circumstances. I do not think the people of the Second District reelected me because my name is Caminetti, but that they elected it was best to send me back to Washington. I shall dedicate all my time and efforts to seeking a solution of this important mining question, protecting them all and recognizing every interest on the same basis of eqality."

At the conclusion of his address, the convention complimented tbe speaker by giving him three hearty cheers.

Adjournment was then taken until 10 A. M. Wednesday.

The headquarters of the State Mining Association having been established in the reception-room of the Palace Hotel, most of the delegates assembled there in the evening. Arrangements had been made to serenade Senator Stewart and Congressman elect Frank G. Newlands of Nevada. The miners gathered in the court of the Palace, and after the serenade, listened to speeches hy these gentlemen. They related mainly to silver and silver mining.

The committees appointed during the session of the convention met during the evening, and some of them continued their labors far into the morning hours. This was particularly the case with the committee on resolutions. What they accomplished is shown in the resolutions, afterward adopted hy the convention, and published on another page.

At 10 A M. on Wednesday the second day's session commenced. The first report presented was from the committee on credentials, of which Major McBride of Sierra was chairman. There had been no contests, and every delegate in the city was deemed entitled to a seat. The list is given in another column. The secretary reported the membership of the association as follows: Alameda, 41; Butte, 200; Calaveras, 85; El Dorado, 270; Mono, 38; Plumas, 250; Shasta, 104; Sierra, 500; Siskiyou, 100; Yuba, 150; San Francisco, 315; Amador, 247; Nevada, 1200; Placer, 1000. Total, 4378. These figures show the strength of the respective county organizations, which combined give that of the State association.

Messrs. Ross E. Browne, Chas. G Yale, John Hays Hammond, Chas. F. Hoffman and J. F. Gourley had prepared a statement of the grievances of the drift mines of the State, and submitted it to the Committee on Resolutions in the form of a memorial to Congress. This was done in order to give the subject distinct prominence, and the committee was asked to permit it to come before the convention in that form. This request was agreed to, and the memorial was adopted hy the convention on recommendation of the Committee on Resolutions. It is published in full on another page. The object of this memorial is to call the attention of Congress to the difficulties of obtaining patent to drift-mining ground under present ridiculous rulings of the Land Office and Department of the Interior. This is a hranch of mining not recognized in the laws, and the general laws as they stand are such as to discourage drift-mining and hamper all engaged in it. The convention unanimously indorsed the memorial and ordered it forwarded to Washington to be presented to Congress by the California representatives.

The resolutions reported by the committee, as printed in another column, are very brief. They reaffirm those adopted by the last convention, which relate principally to the hydraulic mining question. The resolutions approve of free silver; indorse the work and purposes of the State Mining Bureau; call for further work on the State Geological map; and ask for more copies of the State report on auriferous gravels. The main resolutions were those endorsing the Caminetti bill, which has passed the lower House of Congress and is pending in the Senate with certain proposed amendments by Senator Felton. The resolutions also recommend the State to assist in the construction of such debris-impounding works as are recommended by the United States Engineers. A very important one is that relating to the determination of the mineral or nonmineral character of lands, and asking legislation on the suhject. This really took the place of a strong antirailroad resolution which had been offered before the Caminetti, and serves the purpose just as well.

It is well known that under present rulings of the Departments, large tracts of land known to be mineral in character have passed to the railroad. The matter is pending in the courts now, on several cases, hut there is always more or less trouble. Meantime, land is gradually being absorbed by the corporations, which should really belong to the prospectors' domain. This is a hard question for the miners to handle, but they are going to make an effort to have the Government officially determine the character of these lands, so as to stop further depredations on mineral ground. It was not, however, desired to antagonize the powerful railroad influence, and the resolution relating to this subject was drawn as printed.

In this connection, it may be stated that at a subsequent stage of the proceedings the chairman appointed a committee on legislation to consider subjects relating to the mining laws as they affect California, with a view of bringing to the attention of Congress tbe defects discovered hy experience. This committee consists of C. W. Cross, Ross E. Browne, Edward Coleman, John Hays Hammond and Charles G. Yale.

The resolution relating to the Caminetti bill and proposed amendments is commented upon more at length in a separate article in this number of the PRESS. It passed the convention without opposition in the morning, but just before adjournment Major McBride of Nevada couhty arose and said that there were some things in the Caminetti hill which were objectionable to him, and be disapproved of the resolutions brought in by the special committee and adopted at the morning session. The result of this was that for a time it seemed that the harmony formerly prevailing would he disturbed. The subject was discussed by J. K. Luttrell, Niles Searles, C. W. Cross and others in in favor of the bill, and J. W. McBride, Robert McMurray, J. M. Fulweiler and others against it. Judge Walling of Nevada, Judge Dibble, Mr. Spencer of Siskiyou and others wanted the matter referred to the executive committee with power to act. There was a long and somewhat heated discussion on the question of reconsideration of the favoring resolution, but the convention in the end refused to reconsider, and the resolution to indorse the bill stands.

The opposition to the measure had no real strength. A dozen or so men were decidedly opposed to the bill and wanted something better. In fact, they all wanted something better but by far the greater majority knew this was the best that could be obtained and was willing to accept it. The best advice of the members of Congress had been taken and the friends of the California miner had advised the acceptance of this measure. To have refused indorsement of the hill would have placed the dele-

gatinn to Congress and the Miners' Executive Committee in an awkward position, as having urged the passage of a measure opposed to the interests of the miner.

Before this discussion on the question of reconsideration came up, Congressman Geary was called to the platform and made a short but direct and earnest speech. He said nothing against the Caminetti hill—did not mention it in fact, but the inference from his remarks was that a simpler one was needed. After some general remarks, he said: "But to come to the practical part of my talk, and the part in which you are most interested in. Now, you want legislation from Congress. We Californians are an enthusiastic crowd. We go in on every proposition with flags and a brass band. There are a great many people who imagine that all you have to do to secure anything you want at Washington is to parade Pennsylvania avenue with the accompaniments stated. So starting out, we have generally come back minus the brass band and flags. But, to be serious, let me tell you I don't believe that there will be any trouble in securing the legislation in Congress that you require to open the mines; but dont ask too much or think that you can reconcile all interests. That cannot be done. I tell it to you frankly. All this about having a union between the valleys and the hills is rot. I took no stock in that union convention last year. When I learned about the coming together, and, so to speak, marriage of the different conflicting interests, I laughed.

"What you want to do," said Congressman Geary with emphatic earnestness, "is to prepare a naked, simple bill embodying your wants and dissociated from all extraneous interests. Make up such a hill, and I am perfectly satisfied it will become a law this coming session. Remember we cannot pass a great big cumbersome hill. Let your lawyers, you have men of ability and brains in this convention, men like Chief Justice Searles and Judge Walling, and Luttrell of Sonoma—let these men get together and draw up a hill in which is incorporated your wants. Such a hill will pass; but do not embody in it conflicting interests. Don't have anything in it about arid lands. Let what belongs to the River and Harbor hill alone; then there will be no conflict of interests. The way to resume mining is to ask to resume mining and nothing else. This is the only way you can succeed."

Congressman Geary was cheered very heartily when he concluded his remarks.

Judge Searles rose to a question of privilege and denied having made any derogatory remarks concerning Mr. Geary.

Chairman Neff introduced Mrs. Dr. Newlands, who, by the way, is a member of the San Francisco Miners' Association. The lady came to the platform and made a brief speech on mining.

Mr. Myers of Siskiyou moved that the president be authorized to appoint a committee to collect gold specimens, placer and quartz, for exhibition at the World's Fair, and also to consider as to the feasibility of exhibiting a complete set of working plant of hydraulic mining, which was carried.

Niles Searles here read a dispatch he had received from Congressman Caminetti, as follows: "Tell convention that I propose to secure suitable appropriation or not return to California." This announcement was received with cheers.

Mr. Glass moved a special vote of thanks to Major Frank McLaughlin of Oroville, and John Hays Hammond; also to Mr. McMurray, Mr. Luttrell, Mr. Searles and the other members of the delegation to Washington, which was carried.

Then the convention, after electing the officers for the next year (elsewhere reported), adjourned sine die.

The State Mining Convention.

We give herewith the list of delegates from the various counties to the State Mining Convention held here during this week; the committees appointed, memorial and resolutions adopted, financial statement of the State Association, and list of officers elected for the ensuing year:

The Delegates.

ALAMEDA COUNTY.

Blood, W F — Gillett, Chas E — McKusick, H J
Bradley, J T — Hale, W E — Nuesbaumer, Geo L
Casdel, H O — Jackson, D H — Perrine, W D
English, J M — Koser, Newton A — Rutherford, C B
McKilligan, Robt

AMADOR COUNTY.

Barney, E S — Frolech, G — Myers, Jno
Belshaw, M W — Hayes, D E — Parks, J F
Boyson, Dr T — Hale, E P — Reichburgh, F L
Call, A S — Hale, P W — Shaw, S W
Call, Jonas — Judson, E — Tregloan, J R
Christy, S B — Jones, W P — Truscutt, Jno
Caminetti, A — Lepley, J — Taylor, John
Emery, J S — McDonald, M J — Voorhies, E C

BUTTE COUNTY.

Duncan, W E — Hensley, Jno — Price, E B
Halsted, E A — Langdon, H J — Pushbecker, J

CALAVERAS COUNTY.

Cleary, W H — Jeffrey, Wm — Morse, F B
Copeland, Isaac — Lane, C D — Reed, Ira Hill
Davis, Jno F — Lacy, A

EL DORADO COUNTY.

Brown, J M — Hawthorne, J C — Morgan, D W C
Crawford, J J — Jackson, A B — Wickham, D

HUMBOLDT COUNTY.

Bair, T — Cohen, H — Pratt, W H
Brown, T M — Dibbeer, J — Weck, F A
Bull, Jr, J C — Harpst, J — Whipple, S G
Haynes, J P

NAPA COUNTY.

McFarland, A

SISKIYOU COUNTY.

Andrews, M — Daggett, Hon J — Roberts, C
Boyle, J F — Jillson, C B — Spencer, E V
Backus, S W — Myers, A G — Stearns, W H
Deming, T — Parker Jr., A

SONOMA COUNTY.

Allen, S I — Dana, A W — Markley, J
Abbey, R — Frost, C W — McMinn, J Sr
Ames, C G — Luttrell, J K — Ross, H J
Tupper, G A

NEVADA COUNTY.

Andrews, W — Hanley, M — Northway, J A
Bates, M — Hare, O A — Penrose, O
Bigelow, A S — Haskins, J — Preston, E M
Binmeatual A — Helwig, J H — Rauch, A
Bowman, D D — Hogan, M C — Rector, J
Callahan, H C — Hubbard, M T — Riley, P T
Campbell, P — Ismert, A J — Robinson, A S
Carr, J E — Jenson, C — Rolfe, I J
Chadman, O K — Karchickey, O — Ross, A J
Coleman, E — Keeney, O P — Schuesler, C
Crall, S M — Kidder, J F — Searles, Fred
Daniels, T — Kitte, C W — Soarles, Niles
Dibble, A S — Lakeman, J M — Simonds, P F
Dobbie, A E — Lane, H — Saldmore, R
Driesbach, A B — Lutz, F C — Spaulding, H S
Driesbach, N B — Mainhart, G — Thomas, A T
Eastin, C D — Mallon, C — Thomas, R A
Eddy, J — Marsh, M L — Thomas, R J
Elderman, F — Martin, W H — Tilley, E
Engelbright, W F — Marwick, D — Tregidgo, A
English, J — Mason, A D — Turner, O E
Fairweather, T — Mather, J G — Victor, O
Farrel, M J — Miller, A C — Wadsworth, F E
Flood, J — Miller, B H — Waggoner, W W
Foss, W — Mills, H C — Walling, J M
Gaylord, G C — Mitchell, W J — Waters, C L
Glasson, J — Mulvey, J — Watson, S J
Godfrey, F — McBride J S — Welsbein, J
Goldstone, L P — McCall, J F — Wetzel, T
Goodson, G S — McGagan, M — Wohler, O
Gourley, J A — McGlashan, O F — Woodmansee, Dr
Granger, S — McLain, G D — Zaph, O
Grant, O — McMurray, R — Ziedler, F
Griffith, W

PLACER COUNTY.

Abrams, J — Evans, C E — Morgan, Geo
Applegate, Geo W — Filcher, J A — Meredith, J S
Brink, J — Fulweiler, J M — Neff, J H
Booth, W H — Gilbert, E B — Newton, Horace
Burk, Ira — Gleason, M R — Nichols, Jas

SAN FRANCISCO BOARD OF TRADE.

Hawley, Geo T — Strauss, Levi — Nickelsburg, S

SAN FRANCISCO CHAMBER OF COMMERCE.

Ralston, A J — McNear, Geo W — Watt, Robert

Committees.

Chairman Neff appointed the necessary committees, as follows:

Credentials—J. B. McBride, F. R. Wehe, R. G. Hart, S. J. Allen, W. J. Stewart, W. D. Perkins, A. B. Call, —— Duncan, E. O. Spencer, J. J. Maxwell, H. J. McCusick, M. M. Drew, M. H. Meade, J. M. Brown.

Ways and Means—R McMurray, San Francisco; James O'Brien, Yuba; J. E. Doolittle, Placer; A. Tregidgo, Nevada; H. Pichoir, A. J. Bowie, B. F. Dunnam, San Francisco; John Boggs, Colusa; W. H. Pratt, Humboldt.

Permanent Organization—E. Coleman, Nevada; E. C. Voorhies, Amador; W. B. English, Alameda; C. F. Hoffman, Placer; S. K. Thornton, San Francisco; V. S. McClatchey, Sacramento; Ed. B. Price, Butte; J. F. Davis, Calaveras; C. H. Mitchell, Nevada.

Resolutions—Niles Searles, C. W. Cross, J. M. Walling, J. M. Fulweiler, T. L. Ford, C. G. Yale, Ross E. Browne, J. H. Hammond, J. McMurray, J. J. Crawford, J. K. Luttrell, A. B. Dibble, P. F. Simons.

The Drift Mining Memorial.

To the Honorable, the Senate and the House of Representatives in Congress Assembled—Your memorialists, the Miners' Association of the State of California, in convention assembled in the city of San Francisco for the purpose of considering questions relating to the mining interests, respectfully represent:

That there are in the State of California numerous volcanic-capped mountain ridges, which contain underneath the volcanic-capping, ancient river channels, with a bottom layer of gold-bearing gravel, which is sought by the miner and worked by the so-called drift-mining process, said process involving an expensive system of tunneling or deep-shaft sinking through barren material before the pay lead may be attacked.

The driftminer must locate his claim upon the surface of the barren volcanic-capping, and in order to justify the extraordinary expense of the "dead work" in opening the claim there must be included in one enterprise a considerable length of the pay lead, requiring a number of locations to cover it.

Experience shows that the driftminer finds it practically impossible to secure a title to such a group of claims until the mine is almost worked out, owing to the recent rulings of the Commissioner of the Land Office and the Secretary of the Interior to the effect that "the presumption that the gold-bearing channel extends under said hills, or that it contains gold in appreciable quantities will not answer, and the miner must show the actual existence of the gold."

In other words, the existence of the gold must be shown by actual development in each one of the locations separately before the Land Office will admit its mineral character and proceed to issue patent therefor.

The driftminer is thus debarred from obtaining a patent until his mine is nearly worked out, having no guarantee for title in the meantime.

Congress is hereby respectfully requested to so alter the mining laws, at least in so far as they affect the drift-mining, that the driftminer may be able to obtain title expeditiously.

Let the practice of the Land Office be so altered that patent may issue to a group of consolidated and contiguous claims upon mineral land, provided an actual discovery is made upon any one of them, since the present conditions are such as to deter labor and capital from opening, developing or working this important field of the gold-mining industry.

Naturally, capital requires a showing of title. Under present rulings, title cannot be shown until the mine is practically worked out, and, consequently, enterprise is stopped.

It is respectfully suggested that to meet this difficulty, Congress might take the necessary steps to determine definitely what shall be regarded as mineral and what as nonmineral land.

The Resolutions.

Resolved, That the State Miners' Association of California hereby reaffirms the declarations contained in its memorial, preamble and resolutions adopted at the last Miners' convention of this State.

Resolved, That the State Miners' Association of California approve of the Caminetti bill, with the amendments proposed by Senator Felton, and recommend in the interest of the mining industry of California the passage of that bill, with the amendments; but we further recommend that all reasonable efforts be made to secure an appropriation of $450,000 for the purpose of the construction of the dams provided for in said act; and we recommend that the word "must" contained in section 9, as proposed by the amendment of Senator Felton, be rejected, and the word "may," as contained in the original bill be restored, or that there be added to the bill the following proviso: Provided, that this act shall not be so construed as to prohibit the carrying on of any mining operations, prior to the construction of said dams, which can be conducted without material injury to the navigable streams of the State or lands adjacent to said streams.

Resolved, That this convention recommends that the legislature of California make an appropriation to assist in the construction of such impounding works as shall be recommended by any committee of engineers duly appointed for the purpose under any act of Congress which may be hereafter enacted.

Resolved, That the interest of the gold-mining industry of California requires that Congress should pass an act the force and effect of which shall be that all lands which have ever been returned by the United States Surveyor-General as mineral in character, or lands within the well-recognized mineral belt, shall be presumed so to be before the Land Department until the contrary is clearly shown, and that the chairman of this convention be requested to appoint a committee of five to draft such legislation as will reach the wishes of the miners of California upon this subject, report the same to the executive committee of this association for their adoption, and that the same be transmitted to our Senators and Representatives in Congress.

Resolved, That this convention is in favor of and recommends the passage of a law providing for the free coinage of silver.

WHEREAS, The geological map of the State mineralogist in the State mineralogist's report, and issued by the State Mining Bureau, has been of great benefit to the mining community;

Resolved, That we recommend that a new edition with progressive work thereon be brought out, that shall contain more detailed description of the mining regions of California.

Resolved, That the work and purposes of the State Mining Bureau are hereby cordially indorsed by this convention.

WHEREAS, The committee sent to Washington by this convention telegraphed for 1000 copies of the State report on auriferous gravels, and there being only a few copies issued;

Resolved, That the trustees of the State Mining Bureau be respectfully requested to issue 2000 copies of said report.

The Officers.

The Cyanide Process in South Africa.

SAN FRANCISCO, Nov. 15, 1892.

TO THE EDITOR:—The New York *Engineering and Mining Journal* of October 8th and 15th publishes two articles on this snbject by Chas. Butters, Ph. B., and John Edward Clennell, B. Sc. It appears that, except in the magnitude of operations, the Africans are not a whit in advance of our friend Almarin B. Paul, of Shasta county, Cal., or rather I should say that they are distinctly in the rear as to practical work, as may be seen by comparing the articles in question with some that have appeared in the MINING AND SCIENTIFIC PRESS. The process in Africa has been successful only when applied to tailings of free-milling ore, having failed on ore containing pyrites, and on concentrates. They have been using square, wooden vats of 35 to 50 tons capacity, only lately having hegun to use round vats (tubs?) which, however, are of enormous capacity. At the Langlaarte estate, the new vats hold 400 tons of tailings each, and are discharged by means of a dredger, which is a recent improvement, as previously the exhausted material was shoveled into tram cars and so removed. Still larger vats were under construction for the New Primrose mine.

The method of working is thus; the vat is nearly filled with the moist tailings, and a cyanide solution of 0.6 to 0.8 per cent strength is added till the ore is covered. The ore remaios io contact with this liquid for 12 hours, and then the solution is drawn off and passed at once through the zinc boxes. Weak solution of 0.2 to 0.4 per cent is then allowed to filter through the ore for about 8 to 10 hours and is passed to a special zinc box, finally a sufficient quantity of water is applied to displace the solution from the ore. The "weak solution" is that which has already been used and has passed through the zinc boxes. At the Robinson Works the experiment nf "circulating" the solution (as Paul has been doing) was tried with great economy of cyanide, but the anthor states that there is danger of a reprecipitation of gold in this way. (Paul strengtheos his solution a little before returnlng it to the vat) Another suggestion is, to pass the solution through a series of charged vats, so as to get a strong solution of gold for the precipitation.

A new method of precipitating the gold, known as the *Mulloy process*, is under trial and is described as follows: "The solution (of gold) passes through a shallow trough containing mercury, in which is an ioner cylindrical vessel filled with solution of carbonate of soda; the edges of the cylinder just dip beneath the mercury so that its cootents are entirely cut off from the outer portion of the vessel. A rod of lead dips into the soda solution; the lead and mercury are connected with opposite poles of the battery, and the solution is electrolyzed by the passage of a current. The sodium combines with the mercury to form sodium amalgam, which at once decomposes the gold cyanide solution with formation of ordinary gold amalgam, sodium cyanide beiog simultaneously produced." If I understand this not very luminous description, the process seems very promising, though I think a much simpler method would answer quite as well. I propose to see about this. The melting, according to this article, is barbarous. Though not distinctly so stated, it is clear that hlack-lead pots are used, whlch is all wrong, unless the precipitated gold should be freed from zinc, etc., before melting, and this is not done. It is not surprising, therefore, that, although they add sodium bicarbonate to oxidize the zinc, which is good practice, the bullion comes out only .650 fine, hard, brittle and homogeneous, the pot is rapidly destroyed, and a considerable quantity of gold is lost by the volatilization of zioc. Paul loses little or no gold, and gets his bullion .950 fine.

The loss of potassium cyanide is stated to be 3 pounds per ounce of gold recovered when treating free-milling stuff containing about 10 dwts. of gold in the ton, the loss in the vats alone being 1 pound per ton of ore. The extraction is from 70 to 80 per cent, but it is admitted that a much higher yield is obtained io smaller operations when a relatively larger quantity of solution is used. Probably the results would be better if the first or strong solution should be allowed to percolate iostead of standing, and should be circulated more or less, even though no larger quantity should be used. It is well known to silver lixiviators that merely soaking the ore in the liquid, without movement, effects very little. We always stir the sugar in our coffee in this country; do they let it "stand" in Africa?

THE CHEMISTRY OF THE CYANIDE PROCESS.

The two following numbers of the *Journal* contain artlcles, by the same authors, on this subject. These articles are confessedly compilations, but are instructive and interesting. They confirm most of my statements on the subject, not contradicting any, but not touching on all, while giving other facts or opinions of which I was not aware; for example, they make no comment on the unquestionable fact that caustic alkali protects the cyanide from the decomposing effect of atmospheric carbon dioxide, but they claim that the presence of alkali "tends to produce that peculiar and little understood decomposition termed 'hydrolysis.' In this reaction the alkali appears to determine a chemical change in which water plays a part, while the alkali itself is not in the least affected. * * * The hydrolysis of potassium cyanide, which undoubtedly occurs to a considerable extent when excess of alkali is present in the solution or has been added to the tailings hefore treatment with cyanide, gives rise to ammonia and potassium formate

$$KCN+2H_2O=NH_3+HCO_2K.$$"

It is stated, in a foot-note, that "hydrolysis occurs mainly in the zinc boxes and seems to be induced by the presence of the metal." This is another reason for getting rid of the zinc box as soon as possible. We shall then be able to avail ourselves of the advantages of caustic in the solution which, at present, has the disadvantage of greatly increasing the quantity of zinc dissolved, whether there is anything in hydrolysis or not. By the way, Paul found a reduced consumption of cyanide while using caustic lime in excess with an ore which certainly did not cootain much sulphuric acid.

Another interesting statement is that "there are grounds for supposing that in dilute solutions a dissociation of the cyanide takes place, so that what we term a weak solution of potassium cyanide is in reality a mixed solution of potassium hydrate and hydrocyanic acid

$$H_2O+KCY=HCy+KHO.$$

The truth of this theory is supported by the extraordinary fact that a distillation of hydrocyanic acid takes place when a current of a neutral gas (*e. g.*, nitrogen) is passed through a cold dilute solution of cyanide." The acid may or may not answer the purpose of dissolving gold, under the conditions, but, as it is very volatile, much of it must escape from the solutions, as is very properly remarked by the authors. I think, however, that the experiment with nitrogen should not be conclusive; yet, if there is truth in the general proposition, it forms another argument in favor of aholishing the zinc box and uslng stronger solutions.

The writers next review the effect of oxydized sulphurets, showing the destruction of the cyanide by the formation of various compounds of cyanogen and iron, and then discuss the rationale of the application of lime water or caustic soda to prevent such destruction. All this is the more interesting from the fact that the authors, having written without the fear of a James Smith in their minds, have given the formula of each reaction alleged or suggested.

The action of the zinc shavings is considered with regard to the precipitation of the metals and the formation of zinc cyanide, both by replacement and by the electro-chemical effect of the zinc-gold couple, the latter also producing caustic alkali; all as I have stated before in this paper, except that I did not give the formulas. They suggest that the black deposit on the zinc is a "chemical compound of gold and zinc." I have suspected it of being a compound, but thought it might be analogous to the copper compound which I discovered at Calumet, which acted remarkably like *cuprous hydride*. The authors mention copper among the metals recovered, but make no comment on its condition. The different methods of precipitation, and of cleaniog the gold, as tried or suggested, are noticed briefly, and then the methods of assaying the solutions come in for discussion.

It is claimed that the ordioary assay of the solution for available cyanide, as practiced here, fails in accuracy when zioc cyanide is present (always that detestable zinc!) "A white flocculent precipitate occurs at a certaio stage, probably consisting of simple (insoluble) zinc cyanide formed by decomposition of the double cyanide

$$K2ZnCy4+AgNO3=KAgCy2+ZoCy2+KNO3.$$

This precipitation occurs long before the whole amount of potassium cyanide has been converted into the soluble double salt of silver ($KAgCy_2$), for the solution, after the appearance of the flocculent precipitate, still gives the Prussian blue reaction with acidulated ferrous sulphate." Mr. Bettel, at the Robinson General Mining Company's works, has introduced a modified assay process, as follows: "Two perfectly clean flasks of equal size are taken. To each of these is added a considerable bulk, say 50 c. c. of the solution to be tested, and 50 c. c. of water. The liquid in both flasks will probahly appear slightly turbid, but the degree of turbidity will be the same in each. Standard silver nitrate solution is run ioto one flask until the slightest possible increase in turbidity is observed in comparison with the liquid in the other flask. This point is taken as indicating the conversion of the whole of the free potassium cyanide into the soluble silver salt, and, therefore, as determining the amount of available cyanide present in the solution."

From the foregoing, it seems probable that some of our operators may have been led into underestimating the strength of their solutions. The chemist at the Calumet works, however, was aware of this flocculent precipitate, and he used to continue adding the silver nitrate until he was satisfied that the proper precipitate was formed. Some add a very small quantity of salt to the liquid to be tested; the formation of silver chloride then shows the ending.

Mention is made of a white powder which is produced in the zinc box, and consists of a compound of zinc and cyanogen; it forms in preseoce of alkali in the solution. Whether or not this is the white powder which I observed I do not know, but certainly it is different from a bluish-white sample, sent to me by Mr. Paul, which yielded no zinc, as tested hy the blowpipe, and consisted mainly of iron in combination with cyanogen. C. H. AARON.

The Discovery of Iowa Hill Diggings.

Reminiscenses of Persons and Events.

SHADY RUN, Nov. 7, 1892.

TO THE EDITOR:—Forty years ago, on the ridge hetween Indian and Shirt-tail canyons, was a small mining camp of large business proportions. It was the great center of trade for all the mines of the upper gold belt. More $50-slugs, nuggets and gold-dust changed owners here on the holy Sabbath for meals, grub and over the gray blanket (the green cloth had not got this high in the monntains at this time) than any camp of its size in the country. The houses were more useful than ornameotal, all built in the primitive style, of poles and shakes. There was one hotel here; the eater could get a meal for $1 got up in the best shape known to the chief cook—a "Portugee," who had seen much service in that capacity on board of whalers. He was a great success on duff, but it would take too much space to detail what he could and did do.

There were two stores where a miner could get everything he needed, and more too. There was one spacious saloon where the gray blanket was spread on tables loaded with nuggets, slugs and gold-dust. Bill Roland and Andy Vaughn had charge of the menagerie.

The only white woman in the mountains here was Elizabeth Brown, after whom the camp was named. Such was Elizabethtown at the time of whlch I write.

Two of the common miners of this little camp have been carried by the tide of affairs high into public prominence and affairs. They are Jake Neff and Alhert Hart.

There was a colony of lead miners, some of whom had struck the diggings at Wisconsin Hill. There were two brothers and their uncle of this colony—Thom and McKenedy and the uncle, Mr. Sitton. McKenedy was a worker and a good prospector. Thom and his uncle inclioed more to spades and diamonds than pick and shovel. I, in company with Jake and Burr Glasscock and others, were working in Refuge canyon, just south of Elizabethtown. In favorable weather I prospected for hill diggings. On one occasion, while out looking for a place to prospect, I discovered several holes a few feet in depth sunk at short intervals along on the rimrock, on the north side of the gravel range. I thought the gravel looked fine for pay, hut had no pan to test it. A few days after this, I met McKenedy. We always talked mining and prospecting when we met. I told him of what I had discovered; thought I would go over soon and test the gravel. A few nights after this meeting with McKenedy, it was confidentially whispered about Elizabethtown that very rich diggings had oeen struck, but no one but the discoverers knew where they were. The next morning about daylight I stopped on the ridge to rest a bit, after climbing the hill from Indian canyon. A clap of thunder would not have surprised me more than the sound I heard coming from the point of my destination. It was the sound of the ax on the stakes that were being driven around the holes that were sunk. The discovery of Iowa Hill was out, and all the ground that was then considered rich was staked off, and I was left. It came out that McKenedy had the ground well prospected and located several claims for friends at $100 a claim, the money to be refunded if the prospect and location was not satisfactory to the purchaser. Those claims proved to be very rich, and were known as the Jamison claims of Iowa Hill. J. F. TALBOTT.

Mining in Southern California.

Searching for "Lost Mines."

SAN FRANCISCO, CAL., Nov. 11, 1892.

TO THE EDITOR:—I am in receipt of news from the southero part of the State which may interest many of your readers. Mining is beiog pushed quite vigorously in Sao Bernardino county and the winter months promise some new developments in the desert country.

A new silver property is being opened in the Cajon pass, about 30 miles from the town of San Bernardino and not a great distance from Cajon siding. Report says the lead is 50 or more feet in width, consisting of alternate hands of hard and soft material, which returns by assay from $12 to upwards of $30 per ton, mostly silver. At least this is the claim made hy the owners. The mine is opened by a tunnel running in on the strike of the lead about 60 feet, where a crosscut extends "from wall to wall" as represeoted. At the face of the west crosscut a drift extends along the haoging wall a distance of 35 feet; at the face of this drift a vertical shaft is sunk 26 feet and a crosscut run again to the hanging wall 12 feet distant. The total cutting is about 200 feet.

Work is being done on each extension of this property, both north and south. If the reports reaching me concerning this group are reliable, the work now being done may result in the opening up of a mine of great value.

In Lone valley the Rose mine is producing bullion steadily and is also shipplng some high grade ore and building large low-grade dumps for future treatment.

At Silver Reef, 40 miles east of Victor, considerable ore has been mined and piled on the dumps during the past summer and fall months. The value of the ore is extremely variahle, running from 15 or 20 ounces to several hundred. It is mostly chloride and embolite; very little sulphide has ever been found. Iron oxides and copper carbonates, and particularly the latter, characterize the better grade of ore. Some of it also contains high value io gold. Most of the ore bodies thus far developed are small, but the claim owners all hope to open larger masses.

On the desert not far from the Colorado river and below the Needles some prospectors have discovered a copper prospect which will probably be opened the coming winter. As usual, the claims made for the new find are extravagaot, such as, for instance, "a lead 200 feet wide averaging 20 per cent copper, and growiog richer as depth is attained." Prospectors should refrain from making such statemeots as no one believes them and their chances for interesting capital are not enhanced but are actually decreased.

The Tiptop mine in the lava beds, not long since shipped up to San Francisco 85 tons of copper ore averaging 33 per cent copper and 15 ounces silver per ton. The ore was shipped to Swansea, Wales, for treatment.

The owners of claims in the newly discovered districts of Eagle mountain in San Diego county, and the Monte Negras in San Bernardino will put in the winter developing their numerous properties.

In the New York and Vanderbilt districts in San Bernardino county, north of the line of the Atlantic and Pacific railroad, mineowners are working, and these new camps are attracting considerable attention.

The craze to find the lost "Pegleg Smith" mine seems to have died out. Last winter and spring and up to the summer mooths, scores of men were out scouring the desert for this lost mine. Each and every one of them had "straight pointers," and felt confident of finding the long-lost bonanza, but it still remains unfound. I have been told by men whom I consider reliable, that this Pegleg story is a fabrication, pure and simple, and was first told to make a newspaper yarn. Being repeated over and over again for a period of several years, it became a "settled fact," and hundreds of men believed in its existence.

The amouot of hardship and expense, to say nothing of the loss of life which has resulted from the endeavors to find this Pegleg mine, it would seem, would deter men from making further search for it, but I expect the terrific

heat of summer bas nnly held tbem nff, and this winter will doubtless see a repetiton of the same scenes that might be witnessed last season nn the Colorado desert.

The search for the "Lost Lee mine" has also died nut. Lee was a poor, ignnrant prospector who had the most peculiar ideas about minerals. He at one time nwned what is nnw known as the Waterman mine, located not far frnm Barstow. Lee, in speaking nf the prnperty, used tn call it a quicksilver mine. He never suspected the existence of silver in the rock it seems, thnugh I am tnld in his discovery shaft chlnride cnuld be seen nn almnst every piece of nre. There was not a trace of cinnabar in the nre, though it was stained a deep red from iron nxides.

The "Lost Lee" mine is suppnsed tn be located east of Old Woman's Springs somewhere, and is sometimes spoken of as "Lee's white-metal mine." Lee called it a white-metal mine himself. One day in speaking to a friend of mine of his white-metal mine, my friend asked if white-metal was silver. "Oh nn," replied Lee. "It isn't silver, its this white-metal they make these fine stoves of, and is worth a heap more than silver."

The Good Hope mine near Perris in San Diego county is one of the most promising mines in the State. It has been opened by the present owners during the past two years from an abandoned mine with little value to a valuable property. There are three shafts on the vein, two of which are over 400 feet in depth; the center one reaches a lower level, but starts at a lower point on the surface. An ore shoot 800 feet long has been opened, and the workings as they are extended make the mine larger every day.

The mines of the North Fork district situated at the very head of the San Joaquin on the line between Mono and Fresno counties are attracting some attention. The claims are not very extensively developed but give considerable promise. They lie between the Mammoth on the south and tbe Tioga on the north. It is probably only owing to the inaccessibility of this district that it has not heretofore been extensively developed, but this trouble seems about to be overcome.

The coming winter promises considerable interesting development all over the State, particularly in the soutbern section. The northern portion does not suffer on account of scarcity of water and from the intense heat that make life a burden in the southern part during tbe summer months. W. H. STORMS.

Iron vs. Wooden Ships.

A Criticism of the Construction of Modern Iron Vessels.

SAN FRANCISCO, Nov. 12, 1892.

TO THE EDITOR:—Iron ships 20 years ago and iron sbips to-day are two different things. Are iron and steel going to lead in shipbuilding? How handsomely they float on the water and alongside of our docks; every new invention and method is introduced to make the working of them neat and complete. Engineers are fast taking the lead in the construction of iron ships in place of the sailor.

There is no question but that the Iron ships now entering our ports, as far as appearance goes, are perfection itself, and yet they are continually reducing the metal in construction and cost of building. How long are underwriters going to pay for these floating coffins in disguise, before they awaken to the fact that shipbuilders and owners are building these ships for them to pay for?

Books of any business will show profit and loss. With the enormous tonnage of England the insurance companies should get rich and pay large dividends, and they would if they had a fleet of wooden ships instead of iron, or iron ships built as staunch and substantial as they were 20 years ago. Twenty years ago the average size ship was about 1200 tons register; her hull constructed every way proportionately as in regard to depth of hold and so forth.

As shipbuilders in those days allowed so much depth of bold in proportion to lengtb and breadth of beam, the wall sides given the ship of those days gave sufficient longitudinal support, and in all cases larger and heavier material was used in their construction.

Since then, year after year, shipbuilders have increased length and breadth and reduced depth of hold in a great many instances, and in no case increased the depth. The longitudinal support of the long ships they are building today is not sufficient to bold them in a heavy sea. When tbey sit on tbe water and get the support equally distributed under them, anything will hold. But in a heavy sea when a ship sits down on a sea under her middle which has to bear the weight of her both ends as well as her cargo, it takes more to hold than the engineers figures can find a base for.

An iron ship steaming in a seaway is subject to the same laws that any iron is under a heavy strain, and it becomes crystallized through twisting and straining.

Let any insurance company in England overhaul its losses and see how many ships are lost annually that no one knows what becomes of them, or wbat was the deficiency in tbeir construction, or what the cause of their loss. All tbey know is, that tbey must have gone to the bottom and they have to pay for them. The engineer has the means of ascertaining the strength necessary for a piece of machinery or a boiler, but what means has he to determine the strengtb necessary for one of those long ships loaded, when laboring in a heavy seaway. A wooden ship, when sbe is straining, shows her weakness and commences to leak, and thereby gives warning; but an iron ship gives no sucb warning. She strains until the weak part goes; sbe opens out and goes to the bottom, and no one knows where the defect was, in her construction or material. She must have gone to the bottom and they have got them to pay for. How often do we see a piece of iron or a boiler come out of the ship, supposed to stand a certain strain; when but half of this strain has been applied, it gives way and breaks, caused by crystallization or some other defect in the iron.

A cable chain, when it cnmes from the factory, is put to a certain test before it is put on bnard nf a ship, and very seldom one single cable is put on the stretch and the strain put on that it is suppnsed tn stand, without one or mnre defective links being fnund, caused by a flaw in the iron nr crystallization taking place, which so nften has surprised engineers. One day a piece of machinery has been run tn its utmost capacity and stond the test, and the next day broken dnwn just by a wnrking strain. Take a cannnn, for instance; it is put tn the severest test before considered ready for service, and how many there are come from the factory that have prnved failures, although they all pass through the same prncess nf manufacture.

The breaking strain nf a wnoden ship tn-day is twice as great as an iron ship; the only difference is that a wooden ship commences to leak before she breaks entirely, but when an iron ship commences to leak it is usually fatal, and she goes to the bottom, while the wooden ship finds a port for repairs, as a rule, and is seldom a total loss to underwriters. Though they may be at times under expense for repairs, often weathering a heavy storm, they live to pay back; while an iron ship, if she comes into port at all, generally comes in a good condition, looking well, with no sign of weakness perceptible. Wooden ships can be built to last 20 years, and since galvanized iron for fastening has been introduced, can be made to carry any cargo as dry and safe as any iron ship that was ever built. But builders must change their mode of construction and pay more attention to strength in putting their material together. What means has the sailor, or the owner, or underwriter to know what strain an iron ship will stand when she is completed at the shipyard. The only time it is tested is in a heavy gale at sea, and that has proved fatal only too often, as records will show. If there was any method for finding the strength necessary in an iron ship, and any method known for testing them before they left their yards, I venture to say that many ships built in the last five years would have not been allowed to go to sea. Who can tell whether there is one, a thousand, or more rivets crystallized? Those long steel ships are known to spring so as to open several butts in their decks when pitching in a sea. Some of the iron and steel used nowadays in ship-building is much nf a cast-iron nature. The masts and yards are subject to the same laws as the hull. Wooden ships have been dismasted at sea, and rigged up again with what few spars and other material is usually carried aboard of any ship. In such case an iron ship is helpless and has to make port. A carpenter's broadax can do more at sea under difficulties than a cold chisel and hammer. Now, since the old way of building ships as to the dimensions has changed, the material used in construction must also be changed, in order to get the necessary strength for those long ships. A large ship should be timbered as customary, and before the keelson goes in, a diagonal ceiling of any width and thickness in proportion to the size of the ship should be put in. Then put in keelson and longitudinal ceiling as usual; outside diagonal planking to lay opposite to diagonal ceiling inside. Then put on the longitudinal planking and and proceed to knee and fasten the ship as usual. A ship built in this way, of first-class material, fastened with galvanized iron will certainly last 20 years and class A 1. There are on this coast of California vessels built of Oregon pine that have been in service for 20 years, and are still good seaworthy vessels, which goes to show tbe superior qualities of this class of wood for shipbuilding. The large lumber schooners built on this coast at a cost of $50,000 and over, are too shallow for their length, and need diagonal bracing for at least one-half their length amidships in order to make them strong enough to carry any kind of cargo. Even should the material intended, in the first place, be reduced sufficiently to give the diagonal bracing, the vessel would then be much stronger than she would be without. C. F. SWAN.

Gravel Mining in Placer County.

From Our Traveling Correspondent.

The Paragon or Breece & Wheeler.

TO THE EDITOR:—The B. and W., situated at Bath, a mile above Forest Hill, was the first to develop the Blue lead, and at its upper known extremity here it has been cut away by the Middle Fork. Two years and a half ago, however, the company had worked 8000 feet to the limits of their property. Since then they have been busied developing the cross-channel, or Orono, of the Mayflower. The extent of this latter channel is as yet quite undetermined, as it has only been developed at these two points. The supposition is that it is a continuation of the Hazard or Weske channel exposed a few milles farther up the divide.

The Orono does not seem to have cut entirely through the Blue lead, as in places the cement gravel of the latter is the bed of the former. The same tunnel that served to work the original channel is used in the present developments to a point 5000 feet in, and from which it is necessary to work by upraises of about 40 feet. This upper channel has been opened about 800 feet, and in places bas shown a width of 450 feet.

During the past three montbs $5000 have been spent in repairing and rebuilding the mill, putting in new batteries, self-feeders, etc. Ten stamps of 850 pounds, with 97 drops a minute, crush an average of 34 loads per day of 12 hours. A three-eightbs wire screen is used. The gravel averages $6 a ton, while the cost of mining and milling is put at $2 75, leaving thus a very fair margin of profit. Thirty men are employed. Mr. W. H. Grinnell, the general superintendent, stated that an electric-power plant would in all likehood shortly supersede the steam of the present.

THE HIDDEN TREASURE.—Mr. H. T. Power, late of the Mayflower, has been superintendent since the 1st of July and is the largest owner. About this famous mine has grown up the thriving little mining camp of Sunny South, five miles above Michigan Bluff. The channel is entirely distinct from those mentioned of the lower divide, not being generally traceable southward except on the extreme eastern points, the remainder of it having been entirely effaced by the erosion of present watercourses. The Hidden Treasure ran north 9000 feet to their bounds. Here a lava flow caused a break in the channel and its upper continuation of the old Mountain Gate, the channel being generally known as the Mountain Gate nr "White" channel from the quartz character of its gravel. For a great distance this old river-bed is divided by a high ridge of rock, razor-back and islaud-like, which turned the ancient waters into an east and west channel. It was in this western one that the old workings were, and when the end of that had been reached it was supposed that the mine was worked out. The discovery of the east channel two years ago revealed a second Hidden Treasure. At 5000 feet in an east drift disclosed this. Since then work has gone on here toward the face of the mine, a distance of 500 feet and an average 160-foot breast, the gravel being removed through the old tunnel. At the same time a tunnel is running from the front and is in 2300 feet. By the 1st of January it is expected to connect with the back workings, and the mine will then be fully and finely opened. One hundred aod fifteen men, for the most part Chinese, are employed.

THE EUREKA, eight miles above Sunny South, is a property regarding which I was unable to learn much. but for which much in the future is anticipated. Mr. Felix Chappellet is forming a company for its development.

THE RED POINT, situated five miles beyond Sunny South, is operated by a French company, and is under the superintendence of Mr. Chas. F. Hoffman of Oakland. The mine is in the channel known as the Golden River, and is distinct as far as known from those previously mentioned. At this point its course is east and west.

Gravel was struck here in 1888 and work has since progressed continually. The channel was reached by a south tunnel 2200 feet in length and a 20-foot upraise. It was worked west to the limits where it was very rich. East, it has been followed a mile, varying in width from 75 to 700 feet, but always paying best from 200 to 300 feet width. The average pay chute of gravel is about 8 feet in depth. Few pillars are left, all the gravel between the lava-capping and the bedrock being taken out, and timbering is consequently without its usual difficulties.

The gravel is blue and free-washing, and the gold is generally fine and scale-form. Since the mine was opened, Mr. Hoffman states that the average per car has been $2.50. That the gravel runs much higher than this in places may be judged from the fact that the day I visited the mine, I saw an ounce of this fine gold washed from a single pan of dirt from a portion of the mine just then being opened. At present about 100 carloads a day are taken from the mine by a force of 70 men. In the mine there is an unusual and continuous flow of water, amounting to 40 inches, which is carried off in pipes and furnishes the water for washing.

Adjoining the Red Point on the west, and where it proved richest, is the Bob Lewis claim of Mr. Robert Lewis, who seeks purchasers at a good, plump sum.

This completes the list of prominent gravel mines on the divide proper. The Iowa Hill section is distinct and has as its most important properties the Waterhouse & Dorn and the Morning Star.

THE WATERHOUSE & DORN, formerly known as the Harman, is operating two large Bryan mills, though owing to slackness of water, only one is running at present. A modern ten-stamp mill is to be built in the spring, for whicb much of the machinery is now ready. For the past six months the mine has been doing well, and the anxiety of the proprietors to sell has given place to a feeling of satisfaction and faith in the property. In early days the mine was worked a distance of about 2000 feet and 70 feet in deptb by hydraulicking, and could now be similarly worked even to the bedrock. With the present milling mode, it is developed by a 1200-foot tunnel nortbward, with the course of the channel on slight pitch. The present work is that of development. The pay streak runs from six to seven feet in length and 90 in width. Mr. Ellint West assumed charge as superintendent in April of this year.

THE MORNING STAR.—This is rapidly coming to assume among gravel mines a position similar to that held by the Idaho, in quartz, as a dividend-payer. Like the latter, it has a small number of shares—2400—whicb in a degree account for the four and five dollar monthly dividends. As shown by the last annual report of the superintendent and president, Mr. J. H. Neff, the mine has produced the past year $150,000, and the average of the gravel milled has been $7 a car.

The ten-stamp mill has run for the past 30 years, and is one of the oldest on the divide. It is intended to add shortly ten more stamps, put in self-feeders, etc., and remodel the works on a modern basis. Lately, the company has purchased the Iowa Hill canal of the Coleman Bros. of Grass Valley, and are now preparing to introduce water-power. In time the canal will likely be extended to some permanent water supply high in the mountains, as was contemplated by the original projectors. At present the mines of this whole section and of the divide are dependent upon the limited rainy season, and for three months at least water is unavailable for mining purposes and steam becomes necessary in consequence. Witb this intended introduction of water-power, the company has lately laid 2400 feet of lapwelded pipe, securing 460 feet of pressure.

The working tunnel of the mine is in bedrock and run in a southeasterly direction 3200 feet, and up the channel, which is reached by upraises. It is believed that the channel in which Waterhouse and Dorn are operating merges eventually into the Morning Star, while there is still another branch channel lying to the east of the former and toward which present developments in the Morning Star seem trending. The cbannel at present is 170 feet wide and 18 feet deep. Owing to the consequent higb breast, timbering is unusually difficult.

This about concludes the gravel interests of the county. In annther letter I shall give an account of Placer county in quartz. CHAS. E. TOWNSEND.

Mechanical Progress.

Cement Walks.

A correspondent writes and asks the *Operative Builder* to publish some rules or methods for making a cement walk for lawn or garden. As he lives in one of the central States, where the frost is not very severe, perhaps the following method may not only answer his purpose, but may also be of service to others of our readers:

This has been furnished the *Builder* by a practical worker in this department: First, remove all loose earth, and with a heavy earth rammer get the bottom well beaten, having a slight fall to the lowest general point. Then provide the best filling the locality can supply, such as brick rubbish, broken stones, or coarse gravel solidly packed to a sufficient depth from the finished surface required. Coat over this rough ground with a mixture of sharp coarse sand or gravel, six measures of same to one Portland cement. This I get a laboring man to lay on with his shovel, and roughly level I use a garden syringe to spray over the ground before I lay on. This helps to make it go together compact. I also give to the earth a good ramming. Having my rough prepared thus, I find the level for my finished surface and set two wooden rules about five feet apart. Their upper edge must be straight, and set level to height of floor required. I then fill in a mixture of four parts sharp clean gravel to one Portland cement between the rules, and with a straight edge I get a good level surface by rubbing same to and fro, taking down all mixture that stands over rules. This course I also beat gently to a solid body. If a medium finish is required, I merely hand-float, having a mixture of a finer kind to lay on for leveling up any hollows. I also at this point remove my inside or first rule and fill in its space. If a fine finish is required, I then coat over with neat cement, and trowel to a smooth surface. I always finish complete in one body any portion commenced on rough ground. If I cannot complete floor or path, I continue shifting wooden rules, as described, till I get to the finish. Be very careful at each joining to blend with old and new together by roughing up, then sprinkle with water, drudge in cement, and give a rub of stock brush. The strength or thickness of a floor is to be calculated by the traffic or weight it has to undergo. A great deal depends on the solidity of the bottom earth and packing. I have made very good paths and floors, as described, at four inches deep, including the coating of filling materials, the cost to be calculated by the locality where the work has to be done. I have often tested the weight of a cubic foot of cement as emptied out of the bags. On the average, I find it equal to 90 pounds; likewise coarse washed gravel at 99 pounds, four cubic feet of gravel and one cubic foot of cement, when mixed and packed in floors, will reduce to three and a half cubic feet. Knowing the price of these on sight, the quantity required will give the cost plus the labor. I make an allowance of five per cent for waste. The essential point is to have the gravel, sand, or any other mixture clean and free from dust. I generally wash all the sand I use with cement; bring it to a shallow running stream, throw it in, and turn till the water runs clear. In mixing, I lay down rough boards and form a floor. I then get any suitable old box, knock the bottom out and nail two pieces on each side as handles, have my washed sand close by, place the box on floor, and fill water measure, lift box with ease, the sand remains on floor. If a mixture of broken stones is to be added, I level the sand, place box on same, and measure as I did the sand. I then level over the stones and have the proportion of cement spread over evenly—a very handy tool for doing this is a coarse broom, by drawing it toward the workman. I then turn and mix till the cement is evenly distributed. I then wet with a large watering can having a good large rose. I do not mean this as instruction for professional men in towns, but as a hint to poor fellows like myself isolated in a country village.

LOCOMOTIVE FIRE-BOXES.—Some time since, at a meeting of the Master Mechanics' Association, the question of the material for locomotive fire-boxes came up. One of the leading western roads had locomotives whose steel fire-boxes had shown exceptionally good service, and since they were very old, the conclusion was jumped at that the steel must be crucible steel. One of the leading makers of both crucible and open-hearth steel urged the use of the former on the ground of this splendid record, and the opinion was widely accepted that after all, for real hard service, the good old crucible steel fire-box plates were undoubtedly the best. Unfortunately, an engineer of an inquiring turn of mind had an analysis made of the alleged crucible steel. A glance at the results showed the characteristics of open-hearth steel, and none of the distinguishing elements of crucible steel. It is probable that the plates were among the first turned out at the old Norway works.

A Big Sound Boat.

Last month, at the shipyard of the Delaware River Iron Ship-Building and Engine Works, Chester, Pa., the first section of keel was laid for a new steamer for the Old Colony Steamboat Company of New York, which is designed to beat the record for size, speed and carrying powers of any vessel of her size at present afloat. The new vessel is to supplement the company's Sound fleet, which includes the fine well-known boats "Puritan," "Pilgrim" and "Plymouth," all of which were built at the Delaware River Shipyard, and are splendid specimens of maritime architecture.

The following are the principal dimensions of the ship in question: Length over all, 440 feet (or 20 feet more than the "Puritan," at present the longest similar vessel); length on water-line, 424 feet; depth of hull, 20 feet 6 inches; depth from top of dome, 58 feet; beam, over hull, 52 feet; beam, over barge, 92 feet. The vessel will be constructed entirely of steel, and will be absolutely fireproof. She will have a double hull on the bracket system, divided into 58 water-tight compartments, which will render her nonsinkable. The motive power will be supplied by 8000-horsepower double inclined compound engines, working side wheels with feathering buckets, and the boat will be fitted with ten Scotch boilers and two smokestacks. The speed expected to be obtained is 22 knots per hour. Accommodation is planned for about 1500 passengers in between 400 and 500 staterooms, while the freight-carrying capacity will be 1000 tons or more. The general design and arrangements are almost similar to those of the "Puritan," with the exception of the saloon, which will be placed on the main deck aft, instead of below. The cost is calculated to reach the neighborhood of $1,250,000, and it is stated that the boat when completed will be far ahead of any hitherto launched for similar service. Work will be pushed on as rapidly as possible, all the resources of the shipyard being used to enable the vessel to take the water by next July, if possible.—Iron Age.

The Masonry of Boiler Settings.

The brickwork about boiler settings is, we fear, often very imperfectly laid. It is mostly done by contract, with no one to supervise it who understands the severe use to which it is to be put. The bricklayer, who may never have worked on a job of this kind before, builds good-looking inside and outside walls but the space between is apt to be filled with odds and ends in the most promiscuous manner. Furthermore, he puts the same joint in that he would use if he were building a house, and this is just what we do not want in a boiler setting, particularly in the fire-brick lining of the furnace. The joints throughout the setting should be thin, and the work should be done as faithfully inside as outside. Some sort of prepared fire-clay is used in laying the fire-brick, and it should be mixed up so thin that it cannot well be used with a trowel. Some millowners who may have had experience in this direction will not allow a trowel to be employed at all, but require the men to use iron spoons. The fire-bricks should be dipped in water as they are used, so that when they are laid they will not immediately "drink up" the water from the cement. They should then receive a thin coating of the prepared fire-clay or kaolin paste, and be carefully placed in position with as little of the kaolin or fire-clay as possible. Every sixth course, beginning with the grates, should be a row of headers, well bonded into the masonry behind. The headers are of little use unless they are well secured into the walls of the setting, for when the lower courses of fire-brick have burst away more or less, we have to rely on these headers to a considerable extent to hold the upper part of the wall in position. In repairing fire-brick linings, the lower courses, which burn out fastest, can be removed and replaced without disturbing the upper part of the wall, provided the headers are secure, while if they are not, the entire wall may have to be rebuilt, and this cannot be done without either removing the boiler or tearing down a considerable part of the setting.—Machinery.

Scientific Progress.

A New Carbon Filament.

Mr. C. Zudeking has recently made an extended series of experiments on the action of the electric discharge on the following gases and vapors among others, viz., carbon tetrachloride, chloroform, carbon disulphide, marsh gas, olafiant gas, and coal gas. All these substances furnish solid deposits. A remarkable fact was observed, which speaks strongly in favor of actual electrolysis. It is that the deposit of carbon always grows out from the positive pole in a way that would indicate its having been separated out at that pole and not mechanically projected against it. The experiment is most conveniently made with coal gas, and the sparking done in a cylinder over mercury. The carbon grows from the positive pole in form of a very fine filament, very hard and very brittle, and possessing most excellent conducting power. The film is very thin, indeed thinner than a horse hair. On examining it under the microscope it is found to be toothed in a very regular way, the teeth being sharp cones projecting towards the negative pole. This deposit could not possibly have been formed by mechanical projection of the carbon. From its character the carbon has not been carried to the pole and deposited there, but is, it seems, a true electrolytic separation. In any other way than this it would be difficult to explain the the dendritic forms. Another thing that speaks against the mechanical projection supposition is that the filament is a mere slender thread. These forms have the greatest likeness to, and remind one very much of, the dendritic forms of metals that grow out from one pole in electrolysis of metallic solutions, and the current in that case seems to act just in the same way as in the gas. Finally, when a slip of stiff writing paper is placed between the two poles, one does not observe, on passing the discharge, a blackening of the side of the paper turned towards the negative pole, which would certainly be the case were the carbon deposited by projection on the positive pole. There is, however, some carbon, in the form of soot that can be easily wiped off, depnsited on the negative pole, though only in small amount. This deposit is entirely different from that on the positive pole both in quantity and quality, and is probably a true projection deposit. Consequently the action of the electric discharge on this gas is not simple, but as might be inferred, almost *à priori*, of complex character. Firstly and chiefly, we have an electrolytic decomposition by virtue of which the carbon is deposited in a well-conducting form on the positive pole; and, secondly, we have the dissociation due to the heat of the discharge alone, which in quantity is by far inferior to the former. By the heat of dissociation, molecules of the carbon are set free and are attracted by both the poles by virtue of their constant static changes.

A TRIP TO A FIXED STAR.—Dr. David Gill lecturing recently on "Fixed Stars," hit upon the following adroit method to illustrate the distance to Centauri. The doctor said, as reported in the Boston *Globe:* "We shall suppose that some wealthy directors, for want of outlet for their energy and capital, construct a railway to Centauri. We shall neglect for the present the engineering difficulties—a mere detail—and suppose them overcome and the railway open for traffic. We shall go further, and suppose that the directors have found the construction of such a railway to have been peculiarly easy, and that the proprietors of interstellar space had not been exorbitant in their terms for right of way. Therefore, with a view to encourage traffic, the directors had made the fare exceedingly moderate, viz., first class at two cents per 100 miles. Desiring to take advantage of these facilities, a gentleman, by way of providing himself with small change for the journey, buys up the national debt of England and a few other countries, and, presenting himself at the office, demands a first-class single to Centauri. For this he tenders in payment the scrip of the national debt of England, which just covers the cost of his ticket; but at this time the national debt from little wars had been run up from $3 500,000,000 to $5,500,000,000. Having taken his seat, it occurred to him to ask: 'At what rate do you travel?' 'Sixty miles an hour, sir, including stoppages,' is the answer. 'Then when shall we reach Centauri?' 'In 48,663,000 years, sir.'"

SPIDER THREAD FOR TELESCOPES.—The ingenious astronomer captures a common garden spider and places him on the end of a twig. Then he startles the spider, who immediately drops toward the ground, throwing out a thread as he goes. The astronomer, when the spider has got a little way down, produces a doubled wire, on which he begins to twist the thread. The spider continues spinning and the astronomer goes on twisting the thread till he has enough thread for his purpose. Nothing remains for him but to break the thread, and when he requires it unwind it from the wire as he would cotton twist British astronomers, it may be added, envy their confreres in Australia, for there is a spider which spins a thread of three cords; the British spider's thread contains five cords and is appreciably thicker.—London Tid-Bits.

LISTERINE AS AN ANTISEPTIC.—Dr. A. Martinez Vargas, physician to the general charity hospitals of Madrid, professor of infantile diseases, etc., writes: "For two years I have frequently employed listerine in external and internal operations without having failed to obtain its antiseptic effect. On account of its agreeable odor, and the sensation of freshness that follows its use, it is a topical application that cannot be surpassed in nasal and guttural affections, and in running from the ears that is so common among children and so offensive on account of its fetid smell. In a case of hay-fever or spasmodic rhino-bronchitis, the intensity of the attacks of sneezing was diminished by treating the naso-pharynx with the listerine diluted and stopping up the nostril with cotton soaked in the pure listerine. Its antiseptic properties, demonstrated as they are, and combined with these its aromatic quality, listerine may be elevated to the first rank as the preferable liquid for the disinfection of the hands, face and mouth when there exists any danger of contagion from diphtheria or any similar affection. On account of its freedom from toxic and caustic properties, it may be used as a domestic antiseptic and utilized for external applications and to meet certain necessities where an antiseptic is required in intestinal disorders." The editors of *The Sanitarian*, who have been in the habitual use of listerine in like disorders to those named by Dr. Vargas, for more than twice two years, agree with him in his favorable opinion of it.

ELECTROLYTIC PROCESS FOR ANTIMONY. According to the *Moniteur Scientifique*, Koepp of Rheingau, Austria, has invented the following process for obtaining antimony from its ores. It consists in treating sulphide of antimony with certain salts of oxide of iron alone or in connection with haloid salts in an apparatus from which the antimony is deposited electrolytically. The trisulphide of antimony is decomposed in contact with ferric salts, sulphur is liberated, and the ferric oxide passes to the state of ferrous oxide, and at the same time antimonious oxide passes into solution. The reaction is rapid, and is complete when it takes place in the presence of free hydrochloric acid, or, better, in the presence of a haloid salt, such as common salt. The following reaction is explanatory: $2Fe_2Cl_6 + Sb_2S_3 = 2Fe_2Cl_4 + Sb_2Cl_4 + S_3$. The antimonial solution freed from the sulphur by filtration is submitted to electrolytic action, and the antimony is precipitated at the negative pole, the iron being oxidized at the positive pole, giving a solution of ferric chloride which can be used for the treatment of fresh quantities of sulphides of antimony. The anode and cathode are composed of lead plate. The bath is heated to about 50° and maintained in constant movement. In order to obtain a compact deposit of antimony, it is necessary to employ a current of 40 amperes or thereabout for each square meter of surface of the cathode.

THE MAGNETIC VARIATION.—During the last 40 years the Coast and Geodetic Survey has made numerous observations for the determination of the magnetic variation at the Presidio station. These observations are made yearly because the variation has now nearly reached its maximum movement eastward. It will probably attain its greatest elongation in 1897. Fremont Morse has just finished a very satisfactory series of the measure of the different magnetic elements. The variation is now 16 deg. 40 min. east. This is a quantity of daily use by our city surveyors.

APYRITE is a new Swedish powder of which the full composition is not obtainable. It is known, however, that nitrocellulose enters largely into it. It is claimed that this powder burns without flame or smoke, is not affected by moisture or heat and can be handled and transported without danger. After 800 shots the gun was still clean. With the new Swedish magazine gun it is said that 3 5 grammes will give an initial velocity of 2080 feet, with a pressure of 2260 atmospheres.

NEW DISCOVERY

Mines Revived and Miners Enriched

By the wonderful **MacArthor-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec'y; PARAK MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

(MACARTHUR FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; Champie's Mines, Humbug District, Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 026. Gen. Mgr and Secretary.

REMINGTONS

AT THE

COLUMBIAN EXPOSITION.

The Remington Secures the Exclusive Contract.

The Committee of Ways and Means of the World's Columbian Exposition has awarded to Wyckoff, Seamens & Benedict (Remington Standard Typewriter) the contract for furnishing all the writing machines to be used on the Exposition Grounds during the Fair. A large number will be placed at convenient points throughout all the buildings, and are intended for the accommodation of the general public, representatives of the press, and the officers of the Exposition.—*Chicago Sunday Herald, Aug. 7, 1892.*

The World's Fair Commission already use over 100 **REMINGTONS** in their own work.

Useful Information.

WATERPOWER AND ELECTRICITY. — In an article on the subject of utilizing waste waterpower, particularly in the South, the *Manufacturers' Record* says: Throughout this country there are rivers, streams and brooks which can be utilized and give to the cities and towns near them both power and light. In the South there are hundreds of streams, which, if harnessed, would supply all the electricity needed for years to come. Such power would be cheap, and within the reach of all, the farmer as well as the manufacturer. Few people who watch a stream running in its bed think of the good which might be accomplished by the force which is wasting itself, nor do they realize how much power there may be in it. Suppose a stream 12 feet wide, with an average depth of one foot, runs with a speed of eight miles an hour, if a fall of 20 feet can be secured, by means of a flume or canal, 318 horsepower per hour would be developed. A brook which would fill a flume 3x2 feet and give a fall of 20 feet would yield 160 horsepower per hour, and even though the flume be filled only one foot in depth and three feet in width, 80 horsepower will be secured. Five miles from a certain town in Tennessee there is a beautiful stream which falls 60 feet in one leap, and during the lowest water would furnish over 200 horsepower, while in winter, spring and early summer, or at any time after a heavy rain, over 1000 horsepower could be secured. At Mussel Shoals, on the Tennessee river, over 500,000 horsepower could be developed. There is power enough here to operate the Memphis & Charleston railroad from Memphis to Chattanooga and leave enough over to light every town and city along the line. It would be impossible to name every stream in the South which could be utilized in this way. Some are small and some large, but each could be made to serve in some degree.

THE BOTTOM OF THE OCEAN.—There is a common but eroneous notion to the effect that a human body, or even a ship, will not sink to the bottom of the profounder abysses of the oceans, but will, on account of the density of the waters at a great depth, remain suspended at some distance above the surface of the earth. This is an error. No other fate awaits the drowned sailor or his ship than that which comes to the marine creatures who die on the bottom of the sea; in time their dust all passes into the great storehouse of the earth, even as those who receive burial on land. However deep the sea, it is but a few hours before the body of a man who finds his grave in the ocean is at rest upon the bottom; it there receives the same swift service from the agents which, in the order of nature, are appointed to care for the dead, as comes to those who are reverently inhumed in blessed ground. All, save the hardest parts of the skeleton, are quickly taken again in the realm of the living, and even those more resisting portions of the body in time are, in large part, appropriated by the creatures of the sea floor, so that before the dust returns in the accumulating water to the firm, set earth, it may pass through an extended cycle of living forms.—Scribner's Mouthly.

THE HEATING OF STREET-CARS.—Many devices for heating streetcars are now being put on the market, some of the most practicable of which use a modification of the ordinary rheostatic coils placed about the car as radiators. A number of railways in the Northwest are making use of these very satisfactorily, claiming that they keep the cars comfortable during the coldest weather. The latest invention, however, proposes to employ tanks of water, supplied at the carhouse, renewed as often as the water becomes cold. Whether this will prove a practical method of car-heating remains to be seen, but if such a system of hot-water heating is not too cumbersome for streetcars, there is no reason why the heat usually wasted in the rheostat beneath the cars in necessary regulation should not be thus utilized in the car, either by means of a water-rheostat of the kind at present used in factories for testing purposes, or simply by having the rheostat in the car during the cold weather instead of under it.—Street Railway Gazette.

AN ASTRONOMICAL REVIVAL. — Prof. Barnard's recent lecture on Jupiter and Mars before the California Geographical Society has aroused quite an active interest in astronomical studies, and Prof. Davidson is daily receiving letters from amateur astronomers asking him for information as to the best telescopes in the market and where they can be purchased.

UTILIZING SMOKE.—In the carrying out of the recently proposed plan for utilizing smoke, a practical illustration of its value is cited in the fact that several Scotch iron works are receiving an annual rental from a certain gas company for the privilege of collecting the smoke and gases from their blast-furnaces. The smoke and gases are passed through several miles of wrought-iron tubing, diminishing in size from 6 feet down to 18 inches, and, as the gases cool, there is deposited a considerable yield of oil. At one of the smallest of these installations —a Glasgow plant—there are pumped and collected about 60,000,000 cubic feet of furnace gas per day, and on an average some 25,000 gallons of furnace oil are recovered weekly, using the residual gases, consisting chiefly of carbon monoxide as fuel for distilling and other purposes, while a considerable yield of sulphate of ammonia is obtained. In a small way, a small percentage of the British coke ovens are fitted with condensing gear and produce a considerable yield of oil, for which, however, in its crude state, there is but a limited market, the chief use being for lucigen and other lamps of the same description; also for treating timber for railway sleepers.—Scientific Machinist.

STEEL.—In a recent paper on steel, read by Dr. Anderson before the Iron Institute, England, he is reported as saying that when a piece of solid iron is thrown into a pot of molten iron or steel, the solid metal at first sinks, which shows that its volume is less than the melted substance, but soon the solid piece becomes heated, which causes it to expand, its volume is increased, and it rises and floats on the surface of the molten mass. The action is remarked as being the same both with iron and steel, and is exhibited at once on simply throwing a piece of iron into molted steel, when it can easily be seen to go down, a movement which might be thought to be due to the impetus attained by the piece of iron in falling that height, but as a matter of fact, the iron, if placed upon a fork and lowered without any such impetus, would go down; in the course of a few seconds, however, it comes up again and keeps on expanding until the piece of iron is a considerable distance above the surface of the metal, when it decreases in volume, and, of course, becomes of the same volume as the molten metal which it joined.

LIFE OF SHIPS.—Robert Thompson, president of the Northeast Coast Engineers and Shipbuilders' Association (English), says that the average life of an American-built ship is 18 years. The life of an Italian-built vessel is placed at 27 years. This comparison, says the *Maritime Register*, will startle many shipping people, and some may dispute its correctness. It is shown that the conditions upon which the comparison between the two was made have greatly changed and the table has little value now. In the new merchant marine which is being built up in this country, steel and iron largely take the place of wood, and as Americans rank high as expert shipbuilders, it is quite likely that the new vessels will be found to be equal in all respects to those built in foreign yards. The average life of the ships of other nations is given in the table. Those of France are placed at 20 years, the Dutch 22, German 25 and British 26.

DEVELOPMENT OF A "TOY."—A man once invented what the world considered "a toy." Capital, energy and inventive ability pushed the toy up to be "an invention of genius." At the Centennial Exhibition of 1876 the inventor utilized his "toy" for the transmission of speech over a brief distance. Royalty and science applauded. Scoffers claimed a limit to its usefulness, at the same time neglecting the natural American characteristic of progressiveness. Meanwhile, the inventor, assisted by others of ability, toiled in silence and in faith. At the celebration of the 400th anniversary of the discovery of America, the inventor projects his voice along a copper wire 1000 miles long, and his every whisper is distinctly audible at the far end. Conceive, if you can, a more romantic, interesting and wonderful bit of history.—Electrical Review.

ALUMINUM BICYCLES. — Several manufacturers in Europe are now using aluminum in the construction of bicycles, says *Iron*. The aluminum is alloyed with a small percentage of titanium, which is said to increase the strength of aluminum very considerably. The following are given as the results of tests of the alloy and metal used for this purpose. Tensile strength of aluminum 22,300 pounds per square inch; titanium alloy 73,500 pounds. The tensile strength of the alloy is very great if these figures are correct. It is greater than that of wrought iron and steel (48,000 to 67,000 pounds), but is not so great as steel wire, which has a tensile strength of nearly 200,000 pounds per square inch.

CRUSHED sea shells are proving a satisfactory material for pavements in Savannah, Ga. About six miles of the streets of the city are paved in this manner, and it is stated that after the shells are once thoroughly crushed and packed, the pavement becomes almost as hard as asphalt, and that all that is necessary to keep it in good order is a watering once a day and an occasional shovelful of shells placed where it is beginning to wear away. Its durability, even under a heavy traffic, is said to be very good.

GLASS TYPE.—The French newspapers are just now testing a novel sort of type, some made of malleable glass by a new process. The new types preserve their cleanliness almost indefinitely. They are said to wear better than those made of metal, and can be cast with a sharpness of line that will print more distinctly than is possible with the old style type.

ABOUT the last logging that will be done in Michigan, Wisconsin and other lumbering States, according to the *Woodworker*, will be that of reclaiming the millions of feet of sunken logs which now lie in the streams of those States.

THE largest county in the United States is Custer county in Montana, which contains 36,000 square miles, being larger in extent than Vermont, Massachusetts, Connecticut, Delaware and Rhode Island.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
BY J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

ACTUAL BUSINESS PRACTICE.

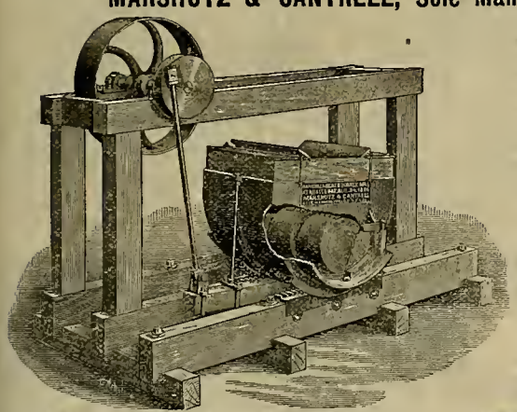
NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.

When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making **a saving of $150 per day**, and also, where it formerly cost me $5.50 per cord for wood delivered at mill, it now costs me but $3 per cord making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

Electricity.

Storage Battery Street Cars.

The Northern Tramway Co. of Paris is making some bold experiments with storage batteries in that city, the following details of which, from the *Bulletin International d'Electricite*, may prove of much interest:

It is proposed to place 16 cars in service on the two lines, the cars being of the ordinary type and accommodating 52 passengers. The body of each car is mounted on two independent axles arranged on distinct rectangular frames. Each axle is fitted with a motor of the Manchester type giving 10,000 watts (about 13½ e. h. p) when running at 1200 revolution. The E.M F. varies according to the speed, the maximum heing 200 volts. The reduction in the speed is effected in the proportion of ten to one by means of two pairs of wheel gearing, and the efficiency guaranteed between the motor axle and the terminals of the dynamo is 70 per cent. The speed of the motor, and, therefore, that of the car, is regulated by a switch having three handles. One of these allows of a change from high to low speed, the reverse operation only heing possible by the aid of a key, which is not in the possession of the driver, hut is kept at the barrier hy an employe who alone can perform the operation. The ohject of the second lever is to short-circuit one motor at low speed, if, owing to an accident, the use of one of the two must be discontinued. The third lever controls the direction of rotation hy the reversal of the current. Each car is fitted with a Chalou brake.

The accumulators, which are contained in six boxes, are arranged under the longitudinal seats inside the car. They comprise 108 Laurent-Cely cells, each having 12 plates and about 37½ pounds of active material, and presenting a side surface of eight inches by six millimeters (¼ inch) thick. The boxes are closed by india ruhber plates which prevent spilliog of the solution through the jolting of the car. The daily journey of a horse car in Paris is 62 miles, hut by the employment of storage battery cars it is expected that 80 6 miles will be covered hy each car, thus requiring five tons of cells. Each car will carry 2½ tons of accumulators, and as the half-day's work is about accomplished, the car will return to the depot for a freshly charged set. The cells are made by the Societe pour le Travail Electrique des Metaux at Saint-Denis, where they will he charged and transported to the cars on small Decauville wagons having movable platforms. The charging station will contain four steam engines with horizontal cylinders and Corliss gear, of 125 horsepower each, and running at from 70 to 160 revolutions; these will drive Desroziers dynamos of 60 kilowatts. This experiment is due to the enterprise of M. Broca, manager of the Northern Tramway Company.

Electricity in Chemical Industries.

Most of the numerous and various applications of electricity are of such a nature that engineers and the reading public soon become familiar with them, but this is not always the case with new developments in electro-chemistry, as chemical processes, when not secret, are, as a rule, of less interest and of little importance to the public, except in so far as they result in the cheapening of a product. Many people, there fore, do not know the great and important progress which is heing made in this field. The great cheapening in the price of pure aluminium and of the aluminium alloys, for instance, is largely due to electric processes. Electric bleaching is much more common than is generally supposed. Electric processes for extracting metals from ore are becoming of more importance every day, although comparatively little appears about it in current electrical literature. A cable dispatch just received from England announces the discovery of a new electric process for obtaining caustic soda, chlorine, and other commercial chemicals from salt water. It is stated to have heen pronounced a great success hy prominent chemists, and to cost but half as much as the present methods. The dispatch gives no other details, and until it is verified and accompanied by further details, little need be said ahout it here. That such processes are possible, however, is well known to all educated electricians, as they may be performed in any laboratory; it remained only to hridge the gap, which often is very wide, hetween the laboratory experiment and a cheap and practical chemical process. If these difficulties have been overcome, as the dispatch leads one to believe, and if such a saving is really effected, the result will doubtless he not only of importance to the manufacturing chemist, hut also to other industries in which such important chemicals as caustic soda and chlorine are used. The oceans are practically inexhaustihle mines of these products, which are and always will be free to the puhlic; this "raw material" can never be taxed by any artificial protective tariff, and monopolies and trusts for raising the prices of this raw material are forever beyond the control of politicians and legislation. A better source of supply could not be desired. It remains only for ingenuity and enterprise to develop processes for converting this free, raw material into commercial products, which, if this report from England is reliable, appears to have heen accomplished.—Electrical World.

Electric Quacks and Impostors.

In the early days of electrical engineering, when dynamos were invariably painted red, and when everybody thought electricity such a wonderful thing that nothing seemed to be too marvelous to be accomplished by it, many impostors reaped a rich harvest hy making use of the ignorance and almost childish confidence which the public had in new and startling electrical inventions, to force upon them all sorts of trash, claiming for it almost supernatural qualities. The great success which quack doctors have had with their patent medicines is very encouraging to a class of unscrupulous electrical impostors, whose name and reputation have no value to them, and the astonishing amount of confidence which an easily infatuated public has in high-sounding schemes aod claims, which a more conservative class of people tell them are not within the limits of possihility, makes the ignorant and confident puhlic excellent prey for these impostors. One of the achievements in the modern development of electrical engineering might be said to he the very material reduction of the number of such impostors, but as there are still plenty of willing victims left, there is even at present quite a field for such quacks, though it is appreciahly less than it used to be. One of the most striking features of the electrical exhibits in the Paris Universal Exhihition of 1889 was the total absence of the primary battery fiend who claimed to get more energy out of his hattery than was contained in the materials used. Many people who claim to be intelligent seem to think that money is easiest earned with things that are stated to be impossible by those who ought to know. In a case which came to our notice not very long ago, an inventor claimed to have devised a motor whose efficiency was 120 per cent, and he made the regular brake test hefore his capitalists, allowing them to make the readings and calculations themselves, to show that his claims were correct. His capitalists, who thought they had a prize, were at first afraid to consult an electrical engineer about it, fearing he would destroy their hopes, but they finally did so, and were shown by him that the speed-counter which had been used registered double, and that the motor was, therefore, a very poor one. Notwithstanding this exposure, however, the invention was afterward sold to some western victims for a fat little sum. In another case, which has just come to our notice, a quack, who is at present reaping rich returns for his dishonesty from among a class of sick women and ignorant men, is selling a $25 medical cell, small enough to be put into a vest pocket, which he claims will give current by placing it in cracked ice, but the most wonderful part is that it requires only one wire to lead off the current, there heing no provision, not even one ground connection, for the return circuit; the cell is placed on a carpet and the victim in a bed—no better insulation could be desired. If space allowed we might cite many other cases to which our attention is being called almost daily. No one can deny that there are manufacturers of primary hatteries who are doing an honest husiness with cells, the claims for which are not unreasonable, and it is to their interest that attention should be called to the impostors. The opportunities for fraud are particularly favorable in the primary battery husiness, and it is therefore to the advantage of those whose claims are modest but honest, to have the public know that their batteries are really better than those for which such pretentious claims are made. Our advice to the huyer is that when a battery company makes claims that seem unreasonable he had better first consult an electrician and follow his advice.—Electrical World.

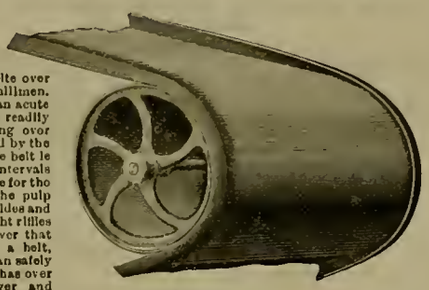
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved ncentrating Belt manufactured in San ancisco. We keep always on hand lts suitable for the Triumph and Frue achines, but can make any length or dth desired. The advantages of these belts over y others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute gle inclining toward the center, and therefore readily nform to the change of direction whil passing over e end rollers; thus the vexation and loss caused by the quent breaking of the flanges of the old style belt is actically done away with. Again, our belts, at intervals two to four feet, have a very slight rifled surface for the ace of three inches, which tends to equalize the pulp the belt, and prevents it from banking on the sides and ming channels through the center. These slight riffles o save very fine sulphurets and the quicksilver that uld otherwise escape with the tailings from a belt, surface of which is entirely smooth. We can safely that it is a better concentrator belt than has over en manufactured. It will last much longer and ll handle more pulp. We also manufacture smooth belts with same flanges when desired.

J. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street, - - San Francisco, Cal.

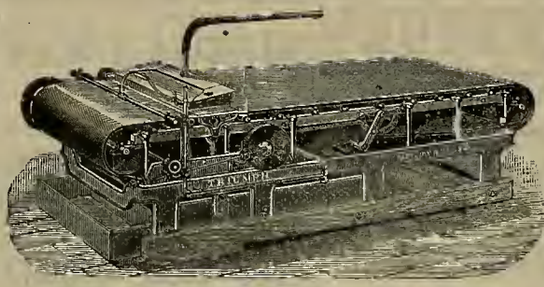
"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

The competitive trials which have been held between the Trinmph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Trinmphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Trinmph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed) Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Nov. 12: Contrary to expectations, sinking has not commenced in the South Eureka as yet, but they think it will be but a short time when three shifts will ba on and the sinking of three or four hundred feet will be pushed with all possible speed. Operations at the Hector have been checked, temporarily we trust. The mill is being run to its full capacity, but it is likely the company will take the water ont to the bottom, as they are very anxious to explore the lower levels, which will enable them to form some definite idea as to the extent of their mine, but will necessarily interfere with the operations of the upper levels during that time. At Belmont the prospects on the 200-foot level are encouraging, and it is the general opinion the deeper levels will make it a paying mine. The Blue Lakes Water Company still has 15 or 20 men employed, mostly at the head of the ditch, engeged in cleaning out and puttihg the ditch in repair for the winter.

Calaveras.

AT MURPHYS.—Cor. Calaveras *Citizen*, Nov. 12: The Beatrice mine, near town, is being developed with e push and energy never seon in mining operations around here before, bnt have had a beckset in the completion of the mill, owing to tha nonarrival of certain parts of machinery. The lengthy tramway leading from the immense ore bin at the top of the hill to the mill on San Domingo, is about completed. The ore thet is now being tuken out is of great mineral value und Mr. Herdy, superiutendent, has highest hopes of the ultimate snccess of his undertaking.

Inyo.

THE DEATH VALLEY COUNTAY.—*California Reporter*, Nov. 11: Messrs. Mack & Kimball have just returned from the Death Valley country, where they heve been doing assessment work on their group of mines, says the Redlands *Citrograph*. The mines are what huve been known in former times as the Goller miues. They have been prospected in a desultory sort of wey, end have always been considered rich. Dr. Mack has become interested with Mr. Kimball, and more thorough exploretion has reveeled many ledges that are rich in gold, silver and tellurium. Assays from the rock rnn very high. Shipments have been made as tests which are highly satisfactory, and steedy work is now expected to be done, and the prospects seem good for the ontput of selected ore to cover ell work of development. This group of mines is sitnated about 150 miles directly north of Redlands and about five or six miles over the line of San Bernardino county in Inyo. They are 80 miles from Daggett by the road. The two best prospected locations are called the Queen of Sheba and the Belmont. They are on the south of Goller canyon, and far np the hill, at the base of which is Mesqnite springs, which efford plenty of weter.

Mono.

THE BODIE CON.—*Miner*, Nov. 11: During the past week east crosscut No. 1, 550-foot level, was extended 7 feet. Upreise from No. 2 north drift 300-foot level, was extended 5 feet. North drift from above upraise was extended 9 feet. West crosscnt, 200-foot level, wes extended 7 feet. We are putting in a new pump-bob fonndation at the 300 Lent shaft; the timbers of the old fonndation ere all rotten.

THE MONO.—During the pest week, south drift, 550-foot level, was extended 10 feet. West crosscut, same level, was extended 9 feet.

Nevada.

GOON LEDGE.—Grass Valley *Tidings*, Nov. 11: The Live Oak mine, in the vicinity of the Lime Kiln, is now getting in fine condition. The mine is owned by some Sacramento parties. Mr. Wm. Werry, the well-known mining man of Colfax, has charge of sinking the shait, and he has sunk 63 feet in the past three weeks. The shaft is a double-compartment one and is timbered in the best manner. The angle of the shaft is 45 degrees. There has been a ledge discovered at the depth of 60 feet, end it shows free gold all through. The country down there is lined with qnertz veins of very large size, and they are easily worked. The company now owning the Live Oak will erect a ten-stamp mill immediately.

A BIG DIVIDEND.—Nevada *Transcript*, Nov. 15: The Champion Mining Company, whose quartz-mining property is located at this city, has just declared a divideud of 50 cents a share. It has heretofore been yielding monthly dividends of ten cents a share, which was doing very well, but now it beats its own record. The last and biggest division of profits among the stockholders is all the more notable when it is known that last month the company expended $17,000 in donbling the capacity of its 15-stamp mill and making other permanent improvements. Thie month it is constructing the heaviest hoisting and pumping rig in the district, and the plant that this is to displace is to be removed to the Merrifield mine (recently acquired by purchase), which is to be reopened this winter by the Champion Company, and which will no donbt be restored before many months to the list of dividend-peyers.

THE HERMOSA MINE.—Grass Valley *Telegraph*, Nov. 15: The Graes Valley Quartz Mining and Milling Company, working the Hermosa mine, held its annual meeting and elected the Board of Directors to eerve e year as follows: Rodger Sheckelton, W. A. Hawley, Thoe. Pierce, Rich'd Connolly, D. B. Marwick. The company has concluded to suspend operations so far es the present shaft is concerned, as the ground is so broken and "thrown over" where the shaft now is that the majority of the company deem it advisable to start another shaft soon. The company owns a large amount of gronud, and the stockholders have not at all lost their grip. In fact, the best miners in the company will stay with it until the last foot is p ospected. The company (all workingmeu) has spent thousands of dollars on the present shaft, and has very few dollers of debt. There will be a few light assessments in future to square up, and then work will be begun on the new shaft.

Placer.

San Francisco, Nov. 14, 1892.

THE MAYFLOWER.—TO THE EDITOR:—Your issue of Nov. 12th contains a report from your traveling egent on the Forest Hill divide. Permit me to say that the report on the Mayflower mine is incorrect. The Mayflower Co. did not yield $87,000 in one week, but it yielded $363,000 in 11 months. The Mayflower Co. has not worked its claim to its south limit The main tunnel is not 4000 feet long, but 5585 feet, and there is not an upward 90-feet-long incline. About the Orono, the company is running e single drift up chennei, first to escertain the value of the gravel; secoud, to drein the ground, which is exceedingly wet. No breasting has been done for nearly two months. The gravel is not of medinm quality. The Orono gravel pays $3.50 per ton when washed through 24 feet of slnices, and $5 to $5.50 per ton when crushed in the mill. The last retnrn of the gravel in the north breast is $14 30 per ton. I wish to know the application of the word "rapids," so profusely used. The assertion that the Mayflower Co. employed 50 men, a majority of them Chinese, is incorrect. The company employs 50 men, among them being 12 to 14 Chinemen. F. CHAPPELLET.

Plumas.

MINING NOTES. — Plumas *National-Bulletin*, Nov. 10: From Chas. W. Hendell of La Porte, a civil and mining engineer of note, we learn thet the mining outlook for thet section and Sierra county is becoming brighter. Several drift mines are operating now, and more will be etarted up in the spring. The Claybank, near La Porte, is owned and operated by an Illinois compeny, with Jes. Lilly, Supt. They now heve a tunnel in 6700 feet. The bedrock is pitching, and the indicetions of soon reaching the pey chennel are good. J. H. Thomas was up a few days ago with eome capitalists looking at mining property. At Thistle shaft, all the winter supplies are in, and the work of driving the main tunnel and gangwaye ahead continnes. They are in rich gravel. At Cedar Grove, 13 meu are employed in the Excelsior mine. The main tunnel is in 1400 feet. At the end of this is an upraise of 35 feet to another tnnnel, which extends 200 feet farther ahead and under 15 feet of gravel. This tunnel is being driven into the hill on the line of the channel. At the mouth of the lower tunnel the company has built a reservoir to husband the water from the mine. Of this property, W. N. Bissette is superintendent. At Wahoo, and opposite the Excelsior, is the Consolidated Golden Era & Suffolk mine, owned by W. S. Chepman and David Moore. Twenty men are employed here, and rich gravel is being worked. The Happy Hollow mine, which e year ago wes supposed to be worked out, has a large crew of men end is taking ont lots of money. From this mine over $750,000 has already been taken out. Mr. Miller is now the superintendent. Out of the old Pioneer hydranlic mine, at Grass Flet, more than $750,000 hae heen extracted. The owners—J. F. Cowdery and Chas. S. Diesen—are opening np the property as a drift mine. They have 15 men employed in running a tunnel, making an upraise for air and sinking en incline. The gravel in this mine is very rich.

Santa Barbara.

BITUMINOUS ROCK.—Lompoc *Journal*, Nov. 11: The bituminons mine on the Hill ranch has ehown such fair developments that Mr. E. B. Hill made up a stock company and had the mine incorporated while in San Francisco not long ago. It is called La Purissime Bitumen and Oil Company.

Shasta.

STAUCK THE LEDGE.—Redding *Free Press*, Nov. 12: The Reid Mines Consolidated Company of Old Diggings, which has been sinking on the old Spanish shaft, in a distance of 15 feet, has come upon the ledge rich in sulphurets. This shaft paid well on the surface, but the ledge petered out in a distance of 30 feet. Now it has come in again. Col. Stevenson is greatly encouraged, as this shaft is being sunk jointly with the Joshua Hendy Co., and will he extended down 500 feet and used as a main shaft through which to work the mines.

IOO NOTES.—Anderson Valley *News*, Nov. 10: Alex. Ludwig commenced Monday to haul the machinery from Anderson depot to the South Fork mining plant. The Bully Choop mines are doing extensive work, and tons of freight pass here every week for these mines. Mr. Ballou of South Fork is doing considerable work for mines in that locality. Wm. Gillon, Phil Martin and Doc Duuham, of the Black Prince mine, at South Fork, are getting out fine ore. W. F. Streater has some good ore in his mines.

Sierra.

ABOUND SIERRA CITY. — Plumas *National-Bulletin*, Nov. 10: Mr. C. W. Hendell, having recently been on a trip to Sierra City, from him we learn that the Young America qnartz mine has etarted ten stamps, with good proepects for a successful run. The Phœnix, below Sierra City, hae also started its mill of ten stamps. Having recently won the snit ebont the wire tramway, Geo. M. Pinney, many years ago well known in political circles, but now of New York, will start up the Mountain mine next spring. It hae a large ledge, and, if properly worked, will pay. The company has a fine mill and good waterpower. At Loganville, it is supposed that the Marguerite mine, owned by Boston capitalists, will be worked again, after suits now pending have been disposed of. The company recently telegraphed H. Barker, the former clerk, to bring its hooks to Boston. He went, and is expected to return in three weeks. A short time since, good quartz was struck in No. 7 tunnel of the Sierra Buttes. The Sierra Buttes mill has been running on quartz from a mine in Gold valley, 12 miles awey, the object of hauling the ore that distance being to meke e test of its value. The Gold Bluff mine, neer Downieville, was recently sold to New York capitalists, who have sent a superintendent out to erect a new 20-stamp mill on the property. The Alaska quertz mine, at Pike City, has been in litigation for some time, but the difficulties are about to be adjusted and the property sold to San Francisco parties. Through the influence of Messrs. Wehe and Van Clief, the owners will put up works to be run hy electric-power transmitted from Yuhe river. Mr. Hendell believes electricity is the coming power in the operation of many of our large mines.

Siskiyou.

GETTING READY.— Yreka *Journal*, Nov. 9: R. C. Crawford has a force of seven men at work near the summit of Scott monntain, at heed of Scott river, in rolling aside large boulders end cutting out roote, so as to be ready in the eerly spring for the commencement of mining, or when the snow does not prevent snccessful working. Mr. C. intends pushing the work of clearing the ground as fast as possible before the winter etorms commence, and as there will be plenty of water in the spring from the melting enow, he will undoubtedly reelize a rich reward for his enterprising efforts in developing a section known to contain rich paying gravel and quartz.

CLEAN-UP.—Yreka *Journal*, Nov. 16: Jas. E. Ironsidee has just cleaned up a crushing of several tons of quertz at his Cherry creek ledge on the divide bstween Yreka and McAdams creek, realizing about $20 to the ton, the qnertz being only such as taken out while doing dead work in sinking shaft and tunneling. When he gets ready to stope, he expects to do much better, and hes quartz enough in sight to yield thousands of dollars. Mr. Barnes, a persevering and energetic miner, elso hus a fine ledge in the seme locality, from which he has taken out some 120 tons to be crushed, and prospecting not less than an ounce to the ton. There are severel other ledges on Greenhorn, Deadwood, Cherry and McAdams creeks, in the seme vicinity, all of which will be worked during the coming winter, when the storms do not prevent. The placer mines on Cherry creek will also be ground-sluiced on an extensive scale, as soon as the snow and reinstorms come to furnish water, as these are dry diggings except during winter and spring.

Trinity.

QUICKSILVER MINES.—Shasta Co. *Democrat*: From Henry T. Bragdon, of Bragdon & Smith, merchants at Castella, we learn that business has been exceedingly good this fall. A pack-train of 35 mules hes been making two trips a week to the Altoona and Boston Quicksilver mines, and the qnartz-mining camp on the line of Shesta and Trinity counties, near the bend of Castle creek. The Integral Quicksilver Mining Co., owners of the Boston and other locations, have their 25-ton smelting furnace nearly completed—in fact, expect to start up the works in a few days. They are now sinking on a body of the richest cinnahar ore ever discovered. The ore hody now being snnk on by the Integral Co. is ahont 20 feet wide. The company intende to put np next summer two or three more 25-ton furnaces, and will employ at least 150 meu in their mine.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, Nov. 16: There has been extracted from all narts of the mine during the week 961 940-2000 tons of ore, which was ehipped to the Morgan mill, the average value of which, per car samples, was $25.69 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $21.03 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $15,537.76.

OPHIR.—1465 leval—We have continued to work north from the drift run south from the Mexican into the Ophir ground, 101 feet below the eill floor of this level, and have extracted and raised to the surface 27 tons of ore, the average assay value of which is $26.50 per ton.

MEXICAN.—On the 1465 level the drift run north from the crosscut rnn east from the bottom of the winze snnk 101 feet below the eill floor of this level, near the eouth line of the mine, has been advanced 16 feet; total length, 285 feet; continuing in a porphyry formation with lines of low-grade quartz.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift, has been extended during the week 27 feet; total length west from the joint shaft 2613 feet; face is in clay and porphyry.

UTAH.—340 level—The north drift from west crosscnt No. 2 has been extended 16 feet; total length, 166 feet, continuing in porphyry, clay and quertz formation.

SIERRA NEVADA.—West crosscut No. 2, from Kenosha tunnel, started from north drift, 800 feet in, has been advanced 29 feet; total length, 337 feet; face in porphyry. The intermediate tunnel has been advanced 23 feet; total length, 115 feet; face in eoft porphyry. In the Cedar Hill drift we have eaved 10 tons of fair-grade ore. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 27 feet, making the total distance west of shaft 2613 feet; the face is in porphyry.

ANDES.—North drift from end of east crosscut No. 1 north was advanced 10 feet; total, 92 feet; formation, clay and porphyry.

GOULD & CURRY.—200 level—The northwest drift, started 435 feet from shaft, has been advanced 14 feet; total length 546 feet; face in porphyry. West crosscut No. 5, in northwest drift, 452 feet from main west drift, has been extended 15 feet through soft porphyry and qnartz; total length, 86 feet. Have also done some repairing in main north drift during the week. On tha Sutro tunnel level, the joint north drift with Savage Co. has been advanced 15 feet; total length, 670 feet. Work was discontinued in the face for three deys, during which time the men did some needed repairing and timbering.

BEST & BELCHER.—900 level—West crosscut No. 2 has been advanced 15 feet; total length, 60 feet; formation passed through, seme as when last reported.

HALE & NORCROSS.—We continne retimbering main shaft above the 900 level. West crosscut No. 3 wes advanced 12 feet; total length, 92 feet; face in hard quartz end porphyry. Advanced mein north drift on this level 20 feet, total length 242 feet; face in porphyry.

CHOLLAR.—We are repairing the north drift, 450-foot level. The east crosscnt, 160 feet south of north line, 930 level, is out 207 feet; face in porphyry.

POTOSI.—The raise from No. 1 crosscut, 1100 level, continues in 2½ feet of $25 ore. The east crosscut, 50 feet sonth of the Potosi winze, 1150 level, is in porphyry and streaks of quartz. During the week we have been enlarging and retimbering 1800 station, Ward shaft. Extracted and sent to mill the past week 309 800-2000 tons of ore from the 550, 980 and 1100 levels. Milled during the week 300 tons. On hand at mill 59 tons, 1200 pounds. Average battery assay, $27.08. Average car semple assays, $27.57.

BULLION.—The west crosscut from north drift, from top of raise from east crosscut, 320 feet south of north line, 1300 level, is out 64 feet; face in porphyry. During the week we have been enlarging and retimbering 1800 station, Ward shaft.

OCCIDENTAL.—From the stopes on 350, 400 end 450 levels we have extracted and milled 175 tons of ore of the average value of $18.55 per ton, as per battery semples. The Zadig drift, Sutro tunnel level, has been extended 14 feet; formation, hard porphyry.

ALPHA.—Dnring the week we have been retimbsring and enlarging the 1800 station, Ward shaft.

EXCHEQUER.—During the week ws have been retimbering and enlarging the 1800 level, Ward shaft.

WAAN SHAFT.—Dnring the week we heve been retimbering and enlarging the 1800 station, Ward shaft.

NEW YORK.—The winze on the 650 level is down 65 feet on the slope; bottom in low-grade quartz. Are taking out from 8 to 10 cars of ore per day, assaying from $25 to $30 per ton. The west orosscnt, 55 feet north of sheft, 800 level, is out 15 feet; face is in porphyry.

SILVRA HILL.— Extracted and milled the past week 115 1640-2000 tons of ore from the 160 and 260 levels.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, Nov. 11: There is little change to report in any of the workings.

BELLE ISLE.—The stopes above the 250 and 350-foot levels are without material change.

NAVAJO.—The stopes above the 350-foot level are looking about as usual. The pump hes been put in order on the 350 station, and pnmping will be resumed dnring the coming week.

Pervine District.

RICH STAIKE NEAR RENO.—*Gazette*, Nov. 12: Cal Sellers was in town this morning with some very rich epecimens of silver ore. He brought them from a ledge that he discovered abont six weeks ago in the Peavine district, 25 miles north of Reno. Judging from the assey made of the first prospect, Mr. Sellers says the ore he has at present will go about $100 to the ton. He has only dng a depth of seven feet, and as the width of the seam increases, he has undoubtedly struck a bonanza and will have no trouble in getting capitel to work it.

Eureka District.

ORE SHIPMENTS.— Eureka *Sentinel*, Nov. 12: The Eureka and Palisade Railroad Company received during the month of October the following lots of ore for shipment to Salt Lake City and other points: Eureke District—Diamond mine, 1196 tons; Eureka Con. mine, 347 tons; Jeckson mine, 93 tons; Phœnix mine, 87 tons; Richmond mine, 81 tons; Bullwhacker mine, 60 tons; Hamburg mine, 46 tons; Williamsburg mine, 16 tons; Dunderburg mine, 14 tons; Delaware mine, 11 tons; and McGeery mine, 11 tons. Total Eureka district, 1962 tons.

White Pine District.

ORE SHIPMENTS.—Eureka *Sentinel*, Nov. 12: The following ore shipments were made last month from White Pine district, White Pine county: From Rocko Kragnazo, 53 tons; C. A. Mathewson, 48 tons; Tom Cornell, 30 tons; J. B. Mathewson, 20 tons. Total, 151 tons.

Ferguson District.

THE CAMP.—*Silver State*, Nov. 11: The latest reports from Ferguson mining district, Nev., are that this new camp is now in the height of its prosperity. The ore-bodies there are holding out well with depth, and new discoveries are of freqnent occurrence.

Montgomery District.

RENEWED INTEREST.—Elko *Free Press*, Nov. 10: Word has been received from Montgomery, in eonthern Nye county, that the interest in that camp is being renewed. A number of

buildings are being erected to be used as stores, dwellings and offices, and large quantities of goods and merchandise are being shipped in. Few men are employed in the mines, for the present, it being the intention of those interested to get other necessary matters in shape for a long and extensive run. Montgomery is in Death valley, and is in the supposed vicinity of the lost Breyfogle mine. No better gold-quartz ledges exist anywhere than in Montgomery district. The assay of an average sample taken from the Montgomery mine gave $31 in gold per ton.

Jackrabbit District.

VOLCANO MINE.—Ferguson *Lode*, Nov. 9: From a letter lately received from Wes Williams of Royal City, we learn that Wes has developed an immense body of high-grade ore in the Volcano mine, in that district. This discovery was made in doing assessment work, and is such a fine showing that a force of men will be immediately put to work to develop the bonanza. Some time in the eighties, Wes refused $10,000 for this mine, and several times since he has been made handsome offers for it, but he always felt confident of proving its worth, and for such reasons never entertained any of the propositions. This late discovery was made in a new place on the ground, at a depth of 12 feet, and proves conclusively the existence of an immense deposit. The ore is a soft carbonate, very heavy in lead, and of a most desirable character for smelting.

ARIZONA.

ANOTHER RICH STRIKE.—Mohave *Miner*, Nov. 12: One of the richest strikes yet made in Minnesota district is reported from the Horn Silver mine, owned by Jas. Smith, Jeff Shepherd, John Mulligan and others. Mr. Smith, while out prospecting last week, discovered a ledge about 30 feet north of the Horn Silver mine, running parallel with that vein, which for size and richness beats everything heretofore found in that locality since the discovery of that camp. The ledge is nearly three feet in width, over two feet of which is solid ore, running on an average from 350 to 500 ozs. in silver per ton, while one foot of the ledge, composed chiefly of rich chlorides, will run away up in the thousands. The boys, of course, are exceedingly joyful over the find, and we hope it may prove as valnable as the present indications would signify, for the boys are all hard workers and richly deserve their good luck. Eugene camp is not a year old yet and the development work on the Horn Silver is very slight, yet we are reliably informed that the owners have refused qnite a large sum for their property. There is quite a number of men in the immediate vicinity of the Horn Silver, all of whom are taking out rich ore, and, as a natural consequence, prosperous and happy. The *Miner* predicts a bright future for Eugene camp aod the hardy miners who have pinned their faith to the prosperity and progression of Minnesota district.

SOUTHERN MOHAVE.—The experts in southern Mohave are making a thorongh examination of all the properties in that section. They will find many good mines there on which to lavish their attention—the Burro, McCracken, Signal and many others. A branch road to Signal from Yucca would be one of the wisest moves a comoany could make should they purchase the Signal properties.

KINGMAN will become the great mining center of the Territory. The vast mining regions to the east, west, north and south will soon ponr in their wealth of mineral to this place for reduction. Narrow-gange roads will be built into the mines of White Hills, Mineral Park and many otber places in the county The vast body of water underlying the town makes it the only place in the conuty snitable for large reduction works.

VALUABLE COPPER MINES.—*Silver Belt*, Nov. 11: We learn from Mr. Oates, superintending the development of a number of claims for the Commercial Mining Co., that he has a splendid showing in the Ingot and Nevada. Considerable work has been done on the Ingot and in the main drift a large body of very rich copper ore was encountered and has been followed for a distance of about 70 feet. The ore-body is apparently doubling back and will be found to parallel the main drift, from which a crosscut will be run to intersect it. The Nevada claim, althongh not so well-opened as the Ingot, is hardly less promising. The shaft is in ore for a depth of 75 feet. The enormous amount of work performed by the Commercial Co. is now beginning to show favorable resnlts, and there is no donbt but that several of their properties will in time become large prodncers.

MONTANA.

FLINT CREEK DISTRICT.—Phillipsbnrg *Mail*, Nov. 10: The Puritan, the latest bonanza mine of the Flint Creek district, continues to improve with each day's development. At the 200-foot level in the west drift three feet of solid ore is now in sight and neither wall is visible. This ore body has developed from what was at first thonght to be only a stringer, and the main vein has not yet been disclosed, thongh a crosscut is under way to reach it. The mine ot the present time is supplying the mill with more ore than can possibly be treated with the 20 stamps in constant operation. The orehouse at the mine is filled with rich rock, and the bins at the mill contain an enormous reserve supply of the rich ore. A 60 foot cooling floor is filled with pulp ready for the pans, and bars of bullion are coming from the retort at the rate of six a week now. Bar No. 31 went to the market in the last shipment. Manager McKechney, who has been east for two weeks, is expected to arrive in a day or two with other members of the company. Soon after their arrival, the site for the new double-compartment shaft will bs decided npon, and the sinking of it will probably be commenced within the next 30 days. The progress of this new company is indeed remarkable, and every indication points to greater advancement and prosperity for a long time in the future. The confidence that the people of Hasmark have in the Puritan mine and the company is shown by the number of new buildings which are being pnt up, and most of them are large, substantial and costly.

NEW MEXICO.

BULLION.—Silver City *Enterprise*, Nov. 12: The Colonial Mining Co., of Mogollon, shipped two more bars of bullion from ore from the Maud S. mine, on Monday. This shipment makes eight bars, with two more ready at the mill to be melted. The bullion is worth abont $1500 each bar, making $15,000 taken out with two Huntington mills in a month. The company is making a large percentage of profit. C. S. Kellum came in from Gold Hill last Sunday, bringing with him 7¾ pounds of melted gold bricks, taken from ore milled from the Engineer mine, which is owned by Mr. Kellum. Harry Logue, who is leasing a part of the mine from Mr. Kellum, has taken out over three pounds of gold from his last mill-run, and will soon make a good shipment. The Engineer is showing up to be a first-class gold mine. On Silver creek the Maud S. mine and mill are working to the perfect satisfaction of the operators and owners. Four bars of bullion, which show a large percentage of gold, have already been melted from their first run. The ore-body in the mine continues to show up well. The Confidence mine is being worked steadily by the lessees, but, on account of scarcity of water, the mill had not been started at last reports, but soon will be, as the first storm of the season will assnre an abundance of water.

LOWER CALIFORNIA.

MARBLE AND IRON AT CEDROS ISLANDS.—*Lower Californian*, Nov. 12: Since the Cedros Island Mining Company's concession to all the mineral land on the island expired, says the San Diego *Sun*, there has been considerable interest manifested in the rich properties which are known to exist there and all of which have not been denonnced thus far. Considering its area, the island is known to be the richest mineral district within the domain of Lower California. Col. Lane, an old Nevada miner, and at present part owner of the Taoama gold mine, about 30 miles east of Tia Juana, holds that the Cedros island mines are the best properties on the southern coast, and that they compare favorably with any south of Alasks. The present company on the island is distinctively a San Diego institntion, and now that a new company, whose headquarters are to be here, is about to engage in mining there, San Diegans will be interested in knowing the real wealth of the island in a mineral way. The mines not only produce gold and a fair percentage of copper, but there are large deposits of marble and iron on the islands surrounding Cedros. The black marble found there is most beautiful in texture and lines, and but for its isolation would long ago have been mined.

OREGON.

THE CRACKER CREEK DISTRICT.—*Bedrock Democrat*, Nov. 10: W. T. Kinsey, who is interested in a number of valuable mining properties in the Cracker Creek district, arrived in the city yesterday morning. The gentleman informed a *Democrat* reporter that the mines of that section never presented a better appearance, and that the large amount of development done this year has had the effect of stimulating the miners in their work of opening up their properties until they have developed into well-defined mines. He is of the opinion that the extensive work carried on this season will be exceeded by that of next year's, and that the progress of the camp will be most rapid from this time on. Mr. Kinsey has a milling-plant on his Silver King property which has been in operation for several months, and reports that everything is working smoothly and he is satisfied with the results. The gentleman departed by yesterday forenoon's train for the East, where he goes on important mining bnsiness.

PROSPECTIVE MINING DEAL.—N. B. Larmour has a deal well under way for the sale of a group of claims in New Leadville district. The prospective purchaser has gone East to submit to his partners the proposition made him by Mr. Larmour and to display samples of the ore. The same parties also wish to purchase a controlling interest in the Vultura.

WILL DO DEVELOPMENT.—Messrs. A. R. Mattoon and G. W. Fought were in the city yesterday, and last evening left by train for the old Straw ranch on Lower Burnt river, in the near vicinity of which is located the Lena mine, owned by Mr. Mattoon and Adam Crossman of this city. It is the intention of the gentlemen to commence active development work on the property at once, continuing operations all winter. They propose to demonstrate the fact whether or not they have a mine.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

SENATOR STEWART and F. G. Newlands, of Nevada, both came here to attend the Miners' Convention. Senator Stewart is an enthusiastic supporter of the Caminetti bill, and the miners also have a firm friend in Mr. Newlands, who has just been elected to Congress from Nevada.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Nov. 17, 1892.

While the local money market is reported to be working close, yet the reserve held by banks is above the average at this season of the year. Exchange on New York is scarce and wanted, which goes to show that remittances are being made with considerable freedom. The demand for Eastern exchange does not come so much from merchants as from railroads and other incorporated companies that have securities at the East and abroad on which interest or dividends, as the case may be, will have to be paid the forepart of 1893. It is quite generally claimed that the requirements from the business community this winter will be less than usual, owing to the trade not carrying so much stock and also to merchants having made closer collections by reason of fears being expressed that we were to have unusually hard times in the near future. Eastern mail advices continue to report fairly easy money markets for the seasnn of the year. The bank reserve, which is moderately large, is being steadily added to. The very heavy imports of merchandise and a falling off in the value of exports, indicates, with all else being equal, a flow of coin to Europe. While the balance of trade appears to be against us, yet it will certainly be only temporary in view of the heavy stocks of wheat and cotton we have which are available for export. Besides this there is a steadily growing demand for American securities, and as this demand appears to be largely for investment, there will be very little arbitrage, which is favorable for a flow of coin to us after the turn of the year.

In trade circles there is a growing feeling of confidence and a more generally expressed opinion that we are entering upon an era of unusual prosperity. What this view of the situation is grounded on, very few are in accord, but the consensus of opinion is that the coming legislation will free the trade of this coast from the high local freight tariff under which business has so long staggered. Merchants claim that the local freights, that is by railroad from this city, are out of all proportion and when reduced within reasonable limits, trade will revive, with our merchants reaching out for a larger proportion of the business now denied to them, owing to comparatively better freights or inducements offered from other large distribution points. Other merchants contend that while the above is correct yet the fact is undeniable that the national election hung like an incubus over general trade, and now that it is past, a revival in business could be looked for in the near future, with a considerable degree of confidence. Continued dry weather is a serious drawback to trade in some sections, but in others it is not felt. The growing belief that Congress will act favorably for the hydraulic mining interest of the State is having a beneficial effect, and if it be fully realized, then the mining industry will forge ahead, and all industries be benefited either directly or indirectly.

The International Monetary Conference will meet at Brussels on next Tuesday. So far our information tends to confirm the general belief among better informed financiers, that the conference will act more favorably toward bimetallism than the most sanguine friend of the white metal had dared to think it would. This change of opinion is based on the growing belief abroad that something must be done to restore silver to its former standing, or else we will enter on a financial and general commercial stringency without a parallel, and that its full effect will be felt abroad and only its vibration visit the United States. This Government has a strong delegation, each member of which is well versed in bimetallism, and will, in consequence, present a strong front. The delegation is strengthened in the secretary to the delegates. The secretary, Dr. Roland P. Falkner, to the delegates from the United States, appears to have been a happy selection, for it brings to the front a man who, by education and training, is calculated to inspire respect, and whose opinions should have weight. Washington advices state that Dr. Falkner was educated at the Wharton School of Finance and Economy, and studied subsequently at Halle, Berlin, Leipzig and Paris. He is the author of numerous monographs on statistical subjects and is editor of Meitzen's great work on statistics, published by the American Academy of Political and Social Science. Dr. Falkner was appointed statistical expert to the finance committee of the United States Senate in its investigation into the course of wages and prices in the United States, and his report has attracted world-wide attention. Dr. Falkner was one of the founders of the American Academy of Political and Social Science, and has been its corresponding secretary since its organization. He is councilor of the American Economic Association, of the American Statistical Association, and is secretary of the American Prison Association. Another happy appointment was that of Thomas W. Cridler, chief of the diplomatic bureau, as the State Department representative of the commission. Mr. Cridler is one of the best informed and most popular of the State Department officials, and will be of valuable aid to the commissioners. As chief of the diplomatic bureau, he is well known all over the world, and consequently his knowledge and acquaintance will be valuable.

SILVER—The market has held barely steady the past few days. The action of the market seems to indicate that operators are waiting for fuller and more reliable advices as to the probable action of the International Monetary Conference. While the opinion gains ground that the conference will act favorably to silver, yet its action not being binding on each nation the metal will continue to fluctuate in value until the leading commercial countries raise it to its former standard. There is a growing conviction with a large class of usually well-informed persons that before the 52d Congress adjourns a free coinge bill will be passed, confining it, though, to the product of this country alone. This, they think, will be done so as to give the prestige of such a measure to Harrison's administration, by which it is thought a strong political point can be gained at the South, in the central States and on this coast. Exports by sea the past week aggregate $67,100 in bullion to Japan.

MEXICAN DOLLARS—The market has held steady at around 67¼ cts. Exports by sea to China the past week aggregate $514 582 The very heavy shipments to China for two months past indicate that dealers in Mexican dollars in that country expect better prices in the near future, and acting on this belief they are importing heavily.

QUICKSILVER—Receipts the past week aggregate 649 flasks. The market is fairly steady at quotations.

ANTIMONY—The market is steady. Eastern mail advices quote as follows in round lots: 11c for Hallet's; 11¼c for LX; 11½c for Crown, and 12c for Cookson's.

LIME—Receipts aggregate the past week 3874 bbls. The market is fairly active at from $1.25@ 1.50 per bbl.

BORAX—Reported receipts aggregate 220 ctls, while the exports by sea aggregate the past week 4030 ctls by sail and 2178 ctls by steamer to New York. The market is steady both here and at the East.

PIG LEAD—The market is barely steady. New York mail advices report an offish market, with consumers indifferent buyers.

TIN—In our market there is nothing new to report. There appears to be a feeling of uneasiness and an indifference to anticipate their wants. New York mail advices report buyers not bidding up for pig for delivery in this year, but for delivery in the first three months in 1893 they bid an advance, going as high as $20.95, without leading to business. London cables report free shipments of plate to this country.

COPPER—The market has been gaining in strength, but with no marked advance in prices. The general tenor of advices from New York and also from abroad indicates better prices later on. Late cable advices from London report as follows: Some undercurrent of firmness has been imparted by advices from Paris of a better feeling there, but consumers buy sparingly although their stocks are low. Inquiries from India have been suspended, owing to weaker market for silver. Adverse statistics, showing smaller deliveries last month than had been expected, restrain outside buying. Furnace material is scarce.

PIG IRON—New York mail advices report a shipment of 250 tons of Alabama to England. If reasonable freights can be secured to England, other and larger shipments will follow. *Iron Age* reports the New York market on Nov. 10th as follows: "From all the leading markets come cheering reports in regard to the situation in pig iron. Sales are not very large, since consumers are pretty well covered for some time to come, but there is no pressure and the recent advance is firmly established. Pittsburg records heavy transactions in Bessemer pig, the aggregate being about 22,500 tons. Most of it has been placed for delivery during the first quarter of next year at $14. Pittsburg, which is now the accepted figure, thus showing an advance from the lowest point of from 30c to 40c ₩ ton."

COAL—Imports the past week aggregate as follows: Nanaimo, 4709 tons; Departure Bay, 4100; Tacoma, 8650; Newcastle, N. S. W., 2405; total, 19,864 tons. The imports of foreign are light. The list of vessels on the way from Australia is quite small, and unless we have heavy rains soon it will not increase unless more money is bid for coal. The imports of domestic coal is not only free, but promise to be large throughout the week. The demand for household coal from the retail trade is increasing owing to colder weather.

Eastern Metal Markets.

NEW YORK, Nov. 16.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38 13-16	84⅜	11 65	3 80	20 60
Friday	38⅜	84⅜	11 70	3 83	20 65
Saturday	39	84⅜	11 75	3 80	20 50
Monday	38⅞	84⅛	11 80	3 80	20 40
Tuesday	38⅝	84⅛	11 90	3 80	20 40
Wednesday	38¾	84⅛	11 80	3 80	20 40

Quicksilver is steady. Pig tin is under manipulation. Copper has a fairly firm undertone. Pig iron continues in good demand. Antimony and borax are steady.

NEW MINING COMPANIES.—The Balaklava Mining Company has incorporated; capital stock, $600,000; directors—Martin Jones, John Henderson, F. C. Mosebach, Sylvester Gardner, T. E. Jewell. The same directors have incorporated the Cosmos Gold Mining Company, with $400,000 capital stock; the Flat Creek Mining Company, with $400,000; and the Bristol Mining Company, with $400,000 capital stock.

Mining Share Market.

SAN FRANCISCO, Nov. 17, 1892.

The market has been gaining in strength, with quite an advance in the shares of both Potosi and Bullion, and an advance of from 10 to 50 per cent in other shares. The higher prices are largely due to manipulation, for as yet the public is not in it; but signs, toward the close, point to more interest being manifested by chronic traders. Never before were there so many hull points out when prices were low as are now being put out; and these points are backed by news, correct or otherwise, from the Comstock mines reporting more ore, improving prospects and much more which is calculated to inspire the cupidity of the more credulous gudgeons. While the writer believes that prices will go some higher—but how much it is difficult to say—yet it is well for outside operators not to run away with the idea that the inside ring will sell them, unless as a bait, a $20 piece below its intrinsic value, but they would rather follow the "mock auction" plan, and, through cappers and paid tools, get all they can above what it is actually worth. While the move is highly colored, yet the conservative operators should look beyond and not be inveigled into the "spider's parlor." There is not the least occasion for doubting that in Belcher there is a good showing, and that, if the ore is properly milled and all the bullion extracted returned to the company, that quite a reserve fund can be accumulated to help to further develop the property. The same can be said of Ophir and three or four other mines. The showing in these mines is taken advantage of to force the share market up by cross-orders and other means, so as not only to unload the shares they have, but also to short the market, provided the gudgeons are not frightened too soon and stop buying. As soon as this takes place, then the usual heavy declines, dragging market and assessment-collecting can be looked for with the utmost confidence.

Conservative and experienced operators—those who have heat the inside at their own game—look with suspicion on the present advance. While they expect to see still higher prices, yet they look for much lower prices after the inside succeeds in selling all the shares they possibly can. This opinion is largely, if not entirely, based on well-authenticated information that in several of the mines much more dead work has to be done before the properties can be safely placed on a paying basis, and as dead work consumes both time and money, several assessments may have to be levied and collected in the interim. This opinion is strengthened by the way in which the Belcher and Potosi mines are being worked and held up as object lessons. These two mines are made to appear as coming bonanzas and the ore milled is made to give large assays and a nominal difference in the pulp and battery assays. The shares in these two mines are said to be well in hand, and therefore they can be the more successfully bulled without the fear of inviting short-selling from moneyed bears. By bulling the shares in these two mines, the ring evidently expects to be more successful in selling the shares in those which are marked for assessments. By referring to the financial statement of the companies, published in last week's PRESS, a fair idea can be formed of which companies are liable to levy assessments soon. The rise in the market in last September admitted of collecting several assessments, and the coming boomlet or advance will admit of repeating the dose.

The market opened this (Thursday) morning strong with Potosi and Belcher still in the lead. There are persons so evil disposed as not only to insinuate but to say that the person who is said to control the former mine is trying to sell his holdings so as to get more money with which to fight M. W. Fox in his suit against the Hale & Norcross directors. Be that as it may, we know that the points out on the shares in that mine are well out, and that each person has something big in the near future. When outsiders can or do buy, insiders must be the sellers,

Outside mining shares have been flat, stale and unprofitable. More assessments are to be levied soon, which are not calculated to improve matters, either.

Reliable news from the Comstock mines is still scarce, although the street is full of reports and rumors of ore strikes and other big things. While these reports may be correct, yet they are evidently put out to influence buying. Our own advices state that the reported development in Potosi is not a safe gamble for anything big. The ore which is being milled by the company, it is said, is taken out of adjoining mines. The Hale & Norcross north drift, when extended still farther into Savage, will admit of important work being done in both mines. In Ophir they are fooling around what looks like what will prove to be a kidney, yet it may turn out to be a bladder. In Sierra Nevada and also in Mexican they are in interesting ground, yet the work may turn out to be most too interesting for outside shareholders. That high-grade ore can be run into in either of the two mines is generally believed, but whether they will is the question that bothers mining men. In Belcher it is said that the work of developing the ore found on the 300-foot level is naturally slow, owing to the soft and treacherous character of the ground. Careful timberlog is in order, besides ex ra care has to be exercised against water when the ore is run into below the last level drained. The ore on the 400-foot level has not been reached yet, for no water has been struck on that level. In Seg Belcher they are running a west crosscut on the 1300-foot level. Belcher is milling ore, as are Savage, Con. Virginia and Potosi. The other mines do not report milling ore.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 8, 1892.

486,019.—STEAM TRANSMITTER—Baker & Laffaw, Tacoma, Wash.

485,832.—TRANSPLANTER—H. Baldridge, Highlands, Cal.

485,602—PRODUCING STENCILS—W. H. Bell, S. F.

485 828.—VALVE AND FAUCET—A. H. Dauchy, San Diego, Cal.

485,932—MUSICAL INSTEUMENT—A. Gylfe, Sonth Bend, Wash.

485,937.—SCRAP-BOOK—J. V. Houston, Linkville, Or.

485,940.—FBUIT-BLEACHINO APPARATUS—E. Ireland, Winters, Cal.

486,053.—BANJO ATTACHMENT—W. L. Roberts, S. F.

485 663.—WATER-WHEEL NOZZLE—C. A. Scharff, S. F.

485,718.—KITCHEN CABINET—E. F. Smith, Stockton, Cal.

485,998.—CASH-REGISTER—E. T. Taylor, Oakland, Cal.

The following brief list by telegraph, for Nov. 15, will appear more complete on receipt of mail advices:

California—Ellen A. Black, Beckwith, hose-supporter; Frederick W. Dohbel, Purissima, wagon brake; William Filmer, San Francisco, clamps for securing stereotype plates; Abe B. Gunzendorfer, Monterey, cash carrier; Pedro de Nspoles, San Francisco, ore concentrator; James T. Smith, Oroville, safety harness; Horace H. Taylor, Fresno, tray for drying fruit; Cahill & Hall Elevator Company, San Francisco, trademark for operating machinery for passenger and fright elevators.

Nevada—Samuel Emrich, Reno, railway spike.

Washington—George H. Garrison, Sumas City, gun swab; John J. Herring, Seattle, double piano stool; John W. McCorkle, Lexington, lubricator.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CARBURETOR.—Daniel Best of San Leandro, Cal. No. 485,526. Dated Nov. 1, 1892. The particular use of this device is to supply gas engines with explosive vapor. It is adapted for oils of heavier grade than can be ordinarily employed for this and other purposes. In the usual methods of carbureting air, the air is passed over or through a body of hydrocarbon oil, from which the lighter vapor passes off first, leaving the remainder so reduced as to be of no value as a vapor-producer. The principle of this apparatus is to take the heavy oil and pass it in small quantities over or through a mass of material, to thoroughly subdivide it, and then, while in this condition, to expose it to a current of air passed through it. The apparatus consists of vertically disposed concentric tubes, outer, middle and inner, peculiarly connected and related, a metallic packing in the middle tube, a means of supplying hydrocarbon to the middle tube, whereby it passes through the packing and is subdivided, and a discharge pipe for the carbureted air passed through the hydrocarbon. The efficiency of the process is increased by raising the temperature of the containing chamber to obtain a larger proportion of the vapor, which, on account of its greater expansive force than that obtained from the lighter oils, is especially valuable for use in gas engines.

ORE FEEDER.—Ernest A. Langford, of Grass Valley, Cal. No. 485,501. Dated Nov. 1, 1892. This device belongs to the class of belt feeders, in which the endless traveling belt receives the charge from a hopper and carries it forward to the mortars. The belt is made of separate metallic sections, peculiarly fitted and hinged together, so that it is practically indestructible, is self-supporting, capable of sustaining itself and its load in a straight line without other support between the pulleys about which it travels, and presents no openings between the sections as they pass around the pulleys.

BOX-NAILER.—James A. Cain of Markham, Cal. No. 485,530. Dated Nov. 1, 1892. This machine is especially intended for box-nailing. It consists generally of an axially rotary carrier provided with concentric rows of nail holes, a fixed plate below the carrier upon which the nails are supported, a regulatable gate for exposing the nail holes successively and allowing them to drop, a chute for conveying the nails to a holder, a hammer operating in the holder to drive the nails, a reciprocating sash for carrying the hammer, and power-transmitting connections between the sash and the nail carrier, whereby the latter is operated. The whole machine is simple in construction and effective and rapid in operation.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F JOURNALS.

"Footprints in the Sands of Time."

Quarrymen operating in the Portland sandstone quarries in the Connecticut valley, recently blasted out a block 130 feet beneatb the earth's surface that was spotted with very interesting and curious marks. The marks, according to scientific men, are footprints of the *anisichnus deweyanus*, whicb was very common in the valley several million years ago, the beast being a combination crocodile-bird.

It is the opinion of Prof. William North Rice of Wesleyan University, to whom the fossil slab was sold for $100, that at the time the *deweyanus* flourished there was no Connecticut river, but in place of it a bay tbat was 15 miles wide, extending from the sound to tbe border of Massachusetts. In tbat epoch, a good many million years since, this crocodile-bird used to batbe in the bay, then come out of it, sbake himself and gambol awbile on tbe plastic micaceous sand, then on top of the earth; and so be left his mark on it. In time the sand became gelid, tbe world grew over it and now workmen toiling in the bowels of the earth, 130 feet below its surface, come on the playground of the *anisichnus deweyanus*, and a professor studying the tracks imprinted in the sandstone is able to tell just what kind of a creature strode about in the Connecticut valley when Time was a babe. Wonderful, indeed, is tbe eye of science, even when it wears spectacles and follows the humdrum vocation of teacbing the modern dude.—Stone.

A PRACTICAL MINER, OWNING A WELL-DEVELoped Quicksilver mine, 100 miles from San Francisco, wishes to enlist capital to work the same on shares, or sell. Principals only need apply. Address

Cinnabar, P. O. Box 2517,

The Hydraulic Gravel Elevator System.

The banks of gold-bearing gravel which are worked in the mining region of this State by the hydraulic process, are washed down by streams of water, under great pressure, being thrown against them through nozzles. One of the problems is to get rid of the tailings or debris after the gold has been taken out in its passage through the sluices, undercurrents, etc. In fact it is easier to find the gravel in place than to find a place for it after it is washed down.

It is this mass of waste material which has brought up the debris question in California, since is has been thrown into the streams and done some injury to them and to adjacent lands. At this time plans are being tried to restrain or impound this debris and keep it from getting into the river. It must be understood that in order to properly work one of these hydraulic mines, means must be provided for the washed-down gravel, dirt, rocks, etc., to be carried away. This cannot be done by hand, the volume being too great. Accordingly, the miner, in working such claims, runs deep bedrock cuts up to the face of the bank, so as to give suitable fall for the water to carry the waste off. In other words, the "dump" must be lower than the bottom of the gravel, which rests on the bed-rock. Without sufficient down-grade from the mine to the dump the mine cannot be worked under ordinary conditions. Sometimes long bed-rock tunnels have to be run (as at North Bloomfield) in order to get this fall, but generally deep cuts in the bed-rock serve the purpose, and in them the sluices to save the gold are placed.

A plan has been devised, however, to overcome some of the difficulties, and this has been applied with success in a number of instances. This is the use of the hydraulic gravel elevator, by which the debris or waste is lifted and run off through a flume. By this means low ground, without fall, may be worked; or, what is more important, the debris can be thrown back into old workings and kept out of streams. Two cuts on this page, made from photographs in a mine, show the application of this system where the mining ground is lower than the dump. One of the views shows a hydraulic giant and its stream of water playing upon a bank of auriferous gravel, and the wash flowing down over the ground to a sump wherein the throat or entrance section of the elevator is securely set. The second view represents the elevator in place, with its outer discharge flume conducting the washed material of earth, sand, gravel, etc., to a final dumping point.

WORKING A HYDRAULIC MINE ON THE ELEVATOR SYSTEM.

THE DEBRIS FROM A MINE PASSING FROM A FLUME.

The principle upon which the operation of these hydraulic gravel elevators is based is the simple fact, which is well-known by hydraulic miners, that water and gravel can be driven uphill by hydranlic force, and that in a flume it is only necessary to give the impelling water more velocity to make it carry more earth or gravel before it. Miners, to accomplish this, give their flumes more grade. It is, therefore, only necessary to give water more velocity than it has through an ordinary flume to make it acquire sufficient force to carry gravel up an inclined plane. This fact suggested the construction of a form of machine which should so direct and confine the inherent hydraulic force of a stream of water as to impel before its power masses of earth or gravel or other heavy material, and the cuts here presented illustrate the features of the machine devised for the accomplishment of that purpose.

Comment.

During the past few weeks, a number of plans for restraining mining debris have been given or sent to the editor of the MINING AND SCIENTIFIC PRESS, with the request that they be submitted to the consideration of the State Miners' Association or its executive committee, with a view to their adoption. In each case reply has been made that the Miners' Association is formed to urge and obtain legislation favorable to hydraulic mining, but has nothing to do with the details of methods of restraining the debris. It should be remembered that a commission of U. S. engineers was appointed by Congress, at the request of the legislature of California, to investigate this debris problem and report a remedy for existing evils. In their report to Congress they recommend a system of restraining dams. On the basis of this report, the miners formed their organization and brought their cause before Congress. Thereupon a bill was drawn up and presented, which provided for the construction of such dams and restraining works, the whole, however, to be upon the plans and under the supervision of the U. S. Commission. This bill has passed the House and is now pending in the Senate. It would be manifestly improper for the Miners' Association to offer to the engineers any plans or systems for restraining the debris. They know what is wanted and know best how proper restraining works should be built. The Miners' Association has no desire to interpose and make suggestions as to methods to be adopted. Therefore it has never considered any plans and would be slow to recommend or indorse any. The plans submitted to the editor, as stated, have not been thus far of a practical character. They have in every instance been designed by people who are not miners, and who have no detailed knowledge of hydraulic mining. In fact, most of them show an entire ignorance of the main difficulties to be overcome. The U. S. engineers, who will supervise such works, are the proper persons to consider plans, and doubtless they have already received more than they have any use for.

The State Miners' Association of last week, though less important than that of last January, was more satisfactory to the quartz and drift miners, in that it considered matters relating to their branch of the gold-mining industry. A movement has been commenced looking to remedies for the defects in the existing mining laws. When these matters are brought to the attention of Congress, backed as they are by such a large association of practical miners, they cannot be pigeon-holed and ignored. As to the hydraulic-mining issue in the convention, it was in the main satisfactory; and had the meeting been held two weeks later, there would have been no friction whatever. That is to say, the heat of a political campaign had not yet entirely gone, and opposition to some measures savored slightly of politics. However, this will pass off and sober judgment prevail in time. The executive committee of the association is a conservative body, and will try to so conduct affairs that the miners' interests will be served without any other being injured in any way.

It is very probable that within the next year or two there will be a very decided revival in the gold-mining regions of California. This State is still the leading producer of gold in the United States, and its capacity can be readily doubled by suitable efforts. The nation needs the gold, and the mines of this metal are more and more in demand. Silver is rather too plentiful for its own good, but gold is getting scarcer. Here our placers are practically exhausted, but the gold-belt of the State is very extended in its area, and there is plenty of room for people to develop the mines. Men with good claims will find it easier to dispose of them in the future, particularly if they are in any forward state of development. Quartz is worked here cheaper than anywhere in the world, and there is plenty of it. More capital is, however, needed in the business, to open the mines and equip them. But there is good inquiry for developed gold mines, and this is bound to increase. Then, too, there is every sign that some means will be found to permit the hydraulic mines to be worked, and these should add from six to ten million dollars to the annual output of the State. With most of these mines again at work, our total gold product would again attract attention and cause still more mines to be opened. These are the signs of the times, and they are hopeful ones to the California gold-miners.

Mineral Lands in National Parks.

In all the Pacific Coast States and Territories where the Government has reserved large tracts of land for any purpose,—mainly for the Indians—there has been more or less trouble keeping settlers out. Both agriculturists and miners want to get into such tracts and utilize the lands. Of late years the Government has adopted the policy of reserving as national parks such sections as have remarkable natural wonders or exceptional scenery, and this greatly adds to the area of the Government reservations. Where such parks have been created after the region has been partly settled, certain injustice is done to those who had made homes or opened mines within the boundaries. We have such a case in this State in the Yosemite National Park. The Government set aside nearly a million acres in the Sierras, and within this area no one may take up land whether mineral, timber or agricultural.

This Yosemite reservation of nearly 1512 square miles, or of 976,000 acres, has 36,111 acres known as the Yosemite grant, which is owned by the State of California, is located within the boundaries of Fresno, Mariposa and Tuolumne counties. The southwest corner of the park is within four miles of the town of Mariposa, the county seat of that county. Some mountain ranches on this area have been cultivated for forty years. About one-third of this vast area is known to be mineral in character. Of this area over five townships, aggregating more than 100,000 acres, are in Mariposa county in the gold mining belt of the foothills and embrace many mines which in years past have yielded enormous returns, and whose prospective values can only be approximately estimated. That portion of the park in Fresno county includes the Minarets and South Fork district, tributary to the San Joaquin, a rich mineral country only partly developed. The miners of this State are anxious for Congress to amend the Park Act so as to exclude from its territorial jurisdiction all lands known to be mineral in character, so that mining may be carried on in conformity with the laws and usages of mining districts the statutes of the U. S., and the settled policy of of the Government. Congressman Caminetti introduced a bill in Congress curtailing the area of this park by about 400,000 acres, leaving 600,000 acres. The present area comprises not only the forests and watershed country of the Sierras, with many picturesque valleys, but a large mining district, with over 200 mines, many of which are now being worked. It includes seventy-five or a hundred actual farms, and these settlers can demand either their land restored or its purchase by the Government at a price as fabulous as they may demand. The Sierra Club of this city has denounced this bill, but Mr. Caminetti explains that the present conditions do great injustice to his constituents in Tuolumne, Merced, Fresno, Mariposa and Kern counties. In all probability Congress will act so as protect the settlers and miners. At all events the possible mining area of this State should not be curtailed. There is too much of that sort of thing already without the Government going into it wholesale, and keeping back several hundred thousand acres of mineral land simply for people to look at and not use.

On the Well Recognized Mineral Belt.

Some of our contemporaries in the valleys are needlessly worrying themselves over a resolution passed by the second Miners' Convention, which asks Congress to pass an act recognizing certain lands as mineral, until the contrary is clearly shown. The resolution reads as follows:

Resolved, That the interest of the gold-mining industry of California requires that Congress should pass an act the force and effect of which shall be that all *lands which have ever been returned by the United States Surveyor-General as mineral in character, or lands within the well-recognized mineral belt*, shall be presumed so to be before the Land Department until the contrary is clearly shown, and that the chairman of this convention be requested to appoint a committee of five to draft such legislation as will reach the wishes of the miners of California upon this subject, report the same to the executive committee of this association for their adoption, and that the same be transmitted to our Senators and Representatives in Congress.

The italics in this paragraph are ours, and the words are thus emphasized to call attention to the fact that the proposed act refers only to a special class of lands, and not to all lands. Certain tracts have been returned to the Surveyor-General by his deputies as mineral, and therefore should be so considered until the contrary is proven. A recognized mineral belt is readidly designated as a place where mining is going on, as in Nevada, Placer, and other mining counties of the State. Any such change as is proposed would not affect in the slightest degree the agricultural counties or regions in many counties better adapted for agriculture than mining.

Surely the miners of the State have some little rights which might be recognized by the departments. The Government reserved the mineral, both from the State and from railroad grants. By so doing it showed an intention of having it utilized by the miners. But under present rulings much of this mineral land is passing from the domain of the prospector into the hands of railroad companies and of ranchers, for whom it was never intended. If an agriculturist can prove that certain land on the mineral belt is no good for mining, he can get it. Under present rulings even when on a mineral belt with mining going on near by, the miner is forced to prove the presence of paying mineral, or else the agricultural claimant walks off with the mines and all. This is manifestly unjust. The miners do not want any additional legislation for agricultural regions, but do want some for the mineral belt which will give them an opportunity to prospect and develop the mineral intended for them by the Government.

There is now no definition of what is mineral ground and what is not. Under present rulings a man can only prove valuable mineral after he has worked his claim out. What is ahead of him, on his claim he cannot prove, though he is called upon to do it by the Department rulings. This seems absurd, and is absurd, but it is a fact. The miners simply call for some just recognition of their rights, which under present conditions they do not get. The farming community has plenty of chance to get agricultural land without entering the miners domain and fencing in the minerals. No harm could be done to any farming interest by the passage of such an act as referred to above; while much good would result to the mining interests of California.

The Hydraulic Gravel Elevator System.

[*Continued from preceding page.*]

An inclined pipe is connected with the flume and one end led to a "sump" or depression in the ground. The open end of the ground section of the pipe is concave in shape, or a lower half-section of pipe flaring outward, into which the earth, sand, gravel, etc., are sluiced by hydraulic giants; the elevator entrance and throat sections are set in a chamber excavated below the bedrock surface. The material sluiced into this entrance is taken up by the stream issuing from a fixed hydraulic nozzle, which, by its impinging force, impels it forward and upward through the pipe to its point of discharge into the open flume above, whence it is carried away through a line of sluice-boxes to a final dump. Confined as this material is, within this tight iron pipe, it is necessarily impelled forward with the velocity of the stream itself, and as each particle of gravel or other material is directly acted upon by the full force of the stream discharged through the hydraulic nozzle, it is considerably disintegrated by this action, as well as by the friction along the pipe in its ascent, and the pulverization is complete.

Of course it costs more to work a mine on this plan than on rough hydraulicking. A great deal more water must be used, for one thing, for there must be a nozzle for the elevator to force the water up, as well as a separate one to wash the material down from the bank, and each of these nozzles must have a supply of water under pressure. But by using this system the vast areas which have been piped out in the past can be utilized as reservoirs for impounding the debris from the remaining banks. This system has been adopted in this State, Colorado and Montana, mainly for working ground too low to provide suitable fall, but as stated, it can also be used, where circumstances favor, for working mines where the debris can be thrown back into reservoirs and kept out of the streams. It should be stated that the waste water is also forced up with the gravel and debris; though sometimes an injector, also operated by water, is used to lift this waste water to the flume that it may flow off.

Coast Industrial Notes.

NEARLY all the whalers have arrived from the North, only three more of the fleet being now due at this port.

THE people of Vallejo, by more than a two-thirds vote, have decided to issue bonds to the sum of $250,000 to build new waterworks.

THE steamer Emily brought down this week the first consignment of shingles from the big shingle mills lately started up at Trinidad, on the North coast.

WITHIN a month the cars of the Metropolitan Railway Company will be running to the grounds of the Olympic Club, on Carl street near Seventh avenue.

THERE is considerable activity in Southern California over mining properties and the chances are very favorable for considerable development being done during the coming year.

STATE Prison Directors De Pue, Hayes, Devlin, Sonntag and Neff audited bills for supplies to San Quentin amounting to $13,695.53 at their last meeting and approved bills for the new jute mill of $2,259.27. The purchase of 300 tons of bitumen for use in paving the new jute mill and the warehouse was ordered.

THE Paraffine Paint Company has been awarded the contract for coating the piles at ferry slips 3 and 4. The contract price is 35 cents a lineal foot. The company is to give a bond to the Board of Harbor Commissioners in $5000 guaranteeing the efficacy for five years of the coating. About $50,000 will be the total cost of the work.

IRVING M. SCOTT, President of the Union Iron Works, is getting ready to leave for Washington so as to be in the capital of the nation before the 15th of next month, on which day the bids for the construction of a new line of battle-ship of 9000 tons and one 8000-ton cruiser will be opened, and the contracts for their building awarded.

THE steamer Noyo came in from Fort Bragg Tuesday having in tow the fourth big lumber raft launched at the Fort. The first of these rafts broke up after launching and was brought down here by installments; the three others have arrived safely. The one which was towed in Tuesday contained about 1,500,000 cubic feet of lumber.

THE Atlas Iron Works, at the Potrero, have decided to rebuild the works that were destroyed on the 7th inst. The loss by the fire exceeded $70,000, and over 150 workmen were thrown out of employment by the conflagration. The delay in liquidating the insurance prevented an earlier decision to rebuild, but the work is now about to be begun.

From Superintendent Houda of Korbel, the Blue Lake *Advocate* learns that iron enough is now on hand for six miles of track on the Canyon creek extension. Three miles have been completed and trains are now running over the extension. Seventy-five men are employed on the railroad and grading will proceed without unnecessary delay. W. X. Miller has charge of the piledriving for the company. The Humboldt Lumber Mill Company have forty-five men in the woods at Korbel.

WORK on the new armored cruiser Olympia has been expedited to the utmost since she was launched on the 5th inst. Only the detention of plates by the Homestead strike can prevent her being towed over to the Government navy-yard by the 15th of June, 1893, which will be in advance of the time called for by the contract by several months. The engines are now in position, and next week the ponderous boilers will be placed in the hull. The Olympia looms up in magnificent shape, and looks larger in the water than she appeared on land.

A boat to trade between Scotia and South Fork on the Eel river, Humboldt Co., is being built by Kneass of this city. She will be 40 feet long, 9 feet beam, drawing 9 inches light, and but 15 inches when loaded. She will be able to make 8 miles an hour in still water. She will be supplied with 15 horsepower engines, and will cost $2,800. She will be brought up on a schooner, taken to Scotia on the cars, when she will be baptized in fresh water. There can be no reason why such a boat if started and run in connection with the ocean steamer entering the mouth to Port Kenyon, should not form a most important feeder.

THE Fish Commissioners' steamer Albatross is under the large derrick at Mare Island, and has had her main and auxiliary boilers, smokepipe and steam drum removed. She is to receive two of the boilers originally intended for the Monadnock. Her machinery is to receive a much-needed general overhauling. She is to be given two new propellers of composition instead of her castiron ones, and work on them has already been commenced in the foundry. The prospects for the employes in the steam engineering department for the coming four or five months is quite bright, and employment will be steady for all during that time at least, and then—

L. W. BUCK, president of the California Fruit Union, came down from Vacaville. In an interview with a reporter, he said: "The shippers received good money for their orchard products during the past season. While some lots brought poor prices, the general average was good; and the growers are well satisfied with the result. We did a large business, and California fruit found its way into all the retail markets of the East. We shipped 1700 carloads of twelve tons each, making 20,400 tons, delivered at our different agencies. This is 400 carloads in excess of the shipment of any previous year. The stockholders will hold a meeting for the election of officers in this city on the third Wednesday in January."

REPAIRS having been completed on the keel of the Mohican, she has been taken out of the stone dock at Mare Island and hauled in alongside of the quay wall. Orders having been received to proceed with her repairs, mechanics are now at work upon her boilers and machinery. Five of the boilers are to be retubed with iron tubes, it being impossible to secure enough new composition tubes for the purpose, and the time allowed not admitting of piecing out the old ones. The necessary repairs outside of boiler work are comparatively trifling, being confined mainly to reparing various cocks and valves, renewing copper pipes and putting new feathers in the intermediate shaft for the after-clutch coupling. The same accident that caused the injury to the keel broke two large steam escape pipes, and they will be replaced by new ones. All the repairs will be completed in a short time, and the Mohican will then be ready for sea, and in as good condition as ever.

THE California Starch Company was organized at Petaluma last week. The capital stock is $200,000, divided into 2000 shares at $100 a share. The directors outside of Petaluma are: John M. Streining, Edwin C. Austin, John Burkart, Henry J. Summer, and Hayes and William J. Adams, all of San Francisco. The proposed factory will be of inestimable value to the producers around Petaluma. Potatoes are grown in great abundance in Sonoma county, and a ready market is assured the farmers. After the potatoes have passed through the factory a pulp remains which is good for cattle food.

THE bids for the completion of the Cascade Locks, Oregon, were as follows: Oscar Huber, Spokane, $1,679,540.41; Dickinson & Co., Tacoma, Wash., $1,525,303.00. N. J. Blagen, Portland, Or. $2,305,882 00; J. G. & I. N. Day, San Francisco, Cal., $1,519,765 00; C. D. Vincent and John Mahoney, San Francisco, Cal., $1,997,212.25. J. P. M. Phillips, et al., San Francisco, $1,799 598 87 To these figures $175,000 for contingencies such as inspection, overseers, etc., must be added, so that there will not be much, if any, saving under the contract system. The trouble heretofore has been that Congress did not appropriate the necessary sums to push the work, but doled out miserable pittances, just about sufficient to pay for the damages wrought by the elements during the winter season. Had the estimates of the engineer officers been approved and appropriations made accordingly, the great canal would have been completed years ago.

MESSRS. STEVENOT & DUHRING are organizing a chemical company in Sonoma, and now have upward of $1000 subscribed. At present there are only two chemical works in the United States that manufacture chrome. One is located in Baltimore and the other at Philadelphia. Both are purchasing the chrome iron ore in California, as it cannot be found in any other part of the United States except on the Pacific coast. This ore is to be found in abundance in Sonoma county and in fact in half the counties of the State, therefore works of this kind cannot fail to be more profitable here than those established in the East. Chrome is used for dyeing purposes, for the manufacture of colors, for electric batteries and a number of uses in the arts. Besides the total production by the Baltimore and Philadelphia works, nearly 1,500,000 lbs are annually imported from Scotland into the United States. Price of chrome in New York 10½ to 11 cts per pound; in San Francisco 13 cts per pound.

THE new Vandercook-Sessions line of electric railway which started up in Oakland this week is about seven miles in length. Starting at the corner of Eighth and Broadway the line runs east on Eighth street to Clinton Station, then on Fifth avenue to east Eighteenth street where a branch runs to Fourth avenue and out on that avenue past Peralta Heights, Merritt Park, and Lake View to Oakland Heights. At the end of this line an attractive park and resort are to be fitted up. At Fifth avenue and Eighteenth street another track runs east on Eighteenth to Commerce and out on the last named street to the powerhouse and car shops, at the intersection of Twentieth. Here transfers to the Highland Park and Fruitvale lines will be given. At the junction of Eighth avenue and Eighteenth street another branch will run out on Eighth avenue to East Twenty-fourth street, and along the latter street to Eleventh avenue, from which point it will be still further extended very soon. All of the appliances are of the latest design, the cars comfortable and of very handsome appearance. The remotest point on the lines can be reached for a five cent fare, with transfer arrangements as indicated above.

COLONEL E. G. WHIPPLE of Eureka, formerly editor and one of the owners of the Humboldt *Daily Times*, is in the city, with several leading men of Humboldt. He and the entire delegation were especially gratified over an award of Chief Government Engineer Mendell and Assistant Engineer Heuer last week. It will be remembered that after a long struggle the people of Humboldt county managed through the recommendations of the Government engineer and the California delegation in Congress to have Humboldt harbor placed in the list of those throughout the country requiring $1,750,000 to complete the harbor improvements. This, though not an appropriation, is considered equivalent to it, and yesterday the contract for all of the work was awarded to J. C. Bull, Jr., of Arcata, and he will take hold of the work of extending the two jetties immediately. "The awarding of this contract means a great deal for Eureka and Humboldt county," said Colonel Whipple. "From $50,000 to $100,000 will be expended in the way of wharves, scows, etc., at once, and a large force of men will be employed continuously till the jetties are completed. It means that $1,750,000 is to be expended there. I suppose it will take five years or such a matter to finish it."

WORK on the dam for the Nevada County Electric Power Company on the South Yuba river is being rapidly pushed ahead, and there is no danger now of the structure being damaged by the winter floods or spring freshets. Dr. H. H. Clark, the treasurerer and general manager, has been in Grass Valley, says the *Tidings*, and he is gratified at the progress made. Victor Dorsey has made some excellent photographs of the work done, showing that the heavy timbers have been laid. The dam will be constructed upon the principles of an inverted Howe Truss bridge. The lumber for the flume has been ordered, but as it is a difficult matter to get the lumber in place, the work of building the flume will be necessarily slow. A large amount of blasting will be necessary to secure proper foundations for the flume. The machinery for the plant has been ordered and the company has received notice that the manufacturers cannot supply the same before April next. By this time the dam and flume will be completed and it will take but a short time to place the machinery in position and run the wires to this city. The company has already secured some contracts for furnishing power, but some of the mineowners are rather "backward in coming forward" with their estimates of the amount of power needed. The Gold Hill mine has secured 100 horsepower, and it is thought that 50 horsepower more will be needed.

SEVERAL applications for street railroad franchises came before the Supervisors in this city at their last meeting. Five applications were acted upon, two of them being extensions of lines now in operation, and the others new enterprises. The number of streets sought to be secured for railroad purposes have a length of many miles over sand dunes, and down valleys to the shore. The application of Marc W. Connor, John O'Ryrne, E. Avery McCarthy, Raymond A. Perry, W. A. H. Connor of San Francisco, and Charles McCarthy and D. H. Austin of New York, for a franchise was passed to print. The right of way asked for commences at the intersection of Circular and San Jose avenues, and continues thence over various streets to the ocean house road, and thence westerly to the ocean. There will be a branch running from the intersection of Masonic avenue and Page street to Ashbury street and Caselli avenue. Other branches begin at Market and Eleventh streets, Forty-seventh avenue and ocean house road and Surrey and Edna streets, all converging to a point south of the Park and near the ocean. The whole right of way covers more than 100 streets. The application of the San Francisco and West Shore Railroad was also passed to print. The right of way begins at the crossing of Twenty-fifth street and Potrero avenue and thence runs across Utah, Nebraska, Army, Vermont, Barneveld and Loomis avenues, and thence southwesterly over various streets to Worcester avenue, the terminus of the road. The third application passed to print was that of W. H. C. Fowler, Louis F. Durand, and John W. Eisenhush. The right of way asked for commences at Twenty-fifth street and Potrero avenue, thence on Twenty-fifth to Harrison, to Twenty-second, to Folsom, to Seventeenth, to Dolores, to Market, to Octavia, to Fulton, to Buchanan, to Eddy, to Steiner, to Greenwich, to Broderick, to Jefferson, to the eastern line of the Presidio; also beginning at Sanchez and Thirtieth streets, thence along Sanchez to Twenty-fourth, to Dolores, to Twentieth, to Church, to Nineteenth, to Sanchez, to Seventeenth and Dolores. The Market street Cable Company filed a petition for a franchise to extend its road from the intersection of Seventeenth and Castro streets, along Castro, Ridley and other streets toward the Presidio Reservation and the waters of the bay. An application was also received from the City Railroad Company to extend its line along Silver avenue, Mission and other streets to the county line.

Personal.

SUPT. THOS. H. LEGGETT, of the Standard Cons. Bodie, is in the city.

D. GRITMAN has resigned the management of the Clinton Co's mine, Amador Co., and W. E. Rogers is in charge.

SAMUEL JAMES, who has acted as superintendent of the Pioche Con. Mining Co.'s smelters, has gone to Salt Lake to live.

MAJOR WM. TOMS, formerly superintendent of the Ridgeway mine, New River, Trinity Co., is quite ill with pneumonia.

T. J. OSBORNE has been appointed as general agent for the Pioche Con. M. & R. Co., and took charge of matters last week.

F. A. FULMORE and J. B. Skewes, two well-known mining men of Bodie, have gone on a prospecting trip to Arizona and New Mexico.

C. T. RYLAND JR., the electrician, who has been superintending work on the Standard Co.'s electric plant at Bodie, has returned to the city.

ASSISTANT ENGINEER EMIL THEISS, who has recently been attached to the Bureau of Steam Engineering, Mare Island, reported for duty at the Union Iron Works during the past week.

MARTIN JONES, secretary of the Belmont and other mining companies operating in Amador county, was in Jackson last week, and visited the Astoria and other mines near Middle Bar, in which his company is interested.

J. H. TIBBITS, Superintendent of the Belmont mine at Sutter Creek, Amador county, has been appointed manager of the Albany mine, which is situated near the Hardenburg, on the Mokelumne river, and this week put several men to work getting the property in shape for extensive operations.

JAMES FINDLEY, the prominent mining man, is at Harshaw, A. T., engaged in superintending the shipment of the Huntington mill to the owners of the Antelope mine at Tucson. The mill will be taken by freight wagons to Tucson. This is the same mill which has ground out so much wealth for the Hermosa.

CHRIS JOCHER is prosecuting work at Park City, Utah, on the old Wasatch mine alone. His partners got tired and quit, as the ore they were taking out did not pay large enough returns; but Chris's faith is of different texture, and he is still strong in his conviction that rich ore is to be found there. His lease has one more year to run, and in that time he expects to see his hopes realized.

MR. JOHN C. EAMES has severed his connection with the Pioche Con. M. & R. Co., and left for Colorado last week. Mr. Esmes has acted as general manager of the company since early last spring, and on a cessation of active work by the company leaves, but expects soon to return to Pioche, as he has great faith in the future of that section, especially when the railroad builds in.

The Mining Outlook in Washington.

SEATTLE, Wash., Nov. 15, 1892.

TO THE EDITOR:—Barring some desultory work in the lower mountain ranges, the mining season in the State of Washington is now closed. Prospecting for claims has been followed generally, and comparatively little actual development done. A number of new and excellent finds have been made, so the coming season of '93 will doubtless result in exploiting some of the many promising prospects to a successful issue, for Washington has, to a remarkable degree, most favorable natural facilities for economic development and mine-working.

The ore channels cut across the precipitous mountain ranges, and may be opened by tunnels, so tbat a judicious expenditure of a moderate amount of capital would place thom in a condition for immediate and cheap mining. Concentrating ores are the rule. The metal to be extracted is diffused in grains and patches through a compact quartz gangue, or in strata, veinlets or seams, more or less refractory.

The gold and silver (gold predominating) is found in an iron-copper pyrites or sulphide, accompanied in many instances with the compounds of arsenic, antimony, galena and zinc in the order named and in a quartz gangue. The gold values are found in the mispickle or "white iron" ore of the miners. Very many feeders, or stringers, have been located that are not worth the recording fee, and extravagant prices are asked for three or four inches of this rebellious mineral. Yet in all of the districts known to the writer there are more than the customary number of claims that give every surface indication of strength and regularity of the ledges. These ledges run in parallel systems, cutting across the country formation and strata, the ore being in chutes or channels varying from 50 to 200 feet in length and from 1 to 20 feet wide, with a clay aelvage or gouge, in some cases on both walls. There is every promise that the ore will hold in depth and will be mined profitably for years to come.

Nature generally equalizes matter—a beautiful man must needs rely on his loveliness, or shape, to carry him through; for, as a rule, his mental holdings are not specially dazzling. Very rich and free ores are found in small seams, pockets or chambers, and very few "go down" to the 500-foot level. On the contrary, the refractory or low-grade ores are usually found in immense chambers or chutes, with a continuity and depth assured. As an illustration, in 1870 the writer mined in Gilpin Co., Colorado. The Bobtail and Gregory mines were then payers, and had been for yeara.

They declare dividenda to-day, and the character of the ore is very like tbat of Monte Cristo and Silver Creek districts of Washington. The immense money expenditures preliminary to opening the Monte Cristo prospects has advertised that district widely. The natural ore exposures are commensurate with the expenditures. No practical mining engineer would fail to be impressed with the parallel system of huge veins, and the prodigious amount of ore in aight, atripped by nature, and practically ready to break down. Besides the several bonanza groups that are capitalized in aix and eight figurea, controlled by the Colby, Hoyt and Wilmans ayndicate, favorable mention may be made of the Packard-Lockery group of twelve claims led by the Rantoul with two to ten feet of ore in place. Also the Peabody group of seven claims, with the favorably situated and promising Hannah in ore. These groups are held by the original locators and are excellent propertiea. In the Silver Creek district no development of moment was done the past season, the confident ownera biding their time until cheaper tranaportation rates, via. the Great Northern R. R. would permit them to work at a reduced cost. The hopes having been realized, they ahould the coming season read their title clear to demonstrated mines of value. This diatrict ahowa the blighted result of misapplied capital, worae than any other locality known to the writer in Washington, and that ia saying much. It ia the aame old, old story familiar to all old-timera, unsuccessful busineasmen, broken-down aporta and amall-calibered relatives of the promotera, with a sprinkling of alfalfa minera, pensioned off. These people are literally blowing good money into valueless holes, with the insane idea there are no barren zones. They drive at the most convenient place and auppose that pay rock ia certain if they are on a mineral vein. The good people of Washington are uot educated up to the fact that it requires a special and practical experience of years to acquire that most important preliminary atep, the proper place and way to open a mine, and that one must be governed almost entirely by each individual propoaition.

Tronblesome creek to East creek, Elk creek, Sultan baain and Index mountain country weaterly from Silver creek have excellent ore ahowinga in clearly-defined ledges, and have a bright future. In the Stilaguamish district work ia progressing in two camps that report they are in a workable grade of ore, and expect it to continue all winter.

Near Mount Baker, Skagit county, new discoveries have been made that promiae well. In King county the district of Snoqualimi has a auperior grade of ores, and considerable development haa been done, but unfortunately the "rule of thumb" and not the "rule of reason" prevailed, so a really meritoriona district ia passed by for less valuable and distant fields. On the head of the Skagit river ia situated the Cascade district. This ia a aure winner for a coming camp, with the best grade of soft, free-smelting ores—a galenite with a good value in gold and silver; a premium fluxing ore. Ita future is beyond cavil. It ia really an assured dividend-paying camp. These diatricts are more directly tributary to Seattle. Other diatricts will be described in a future letter.

TAYLOR D. MACLEOD.

Unless the mining community gives aome voluntary aasiatance to the California World's Fair Commissioners in the matter of aending in apecimens, etc., the exhibit of this State at Chicago will fall far short of expectations, Colorado will lead next year in the matter of an exhibit, and thus advertise herself in a way to bring good returns. The Commissioners here could only spare $15,000 for the mining exhibit, and much of this will go for freight, attendance, etc. They have thus far failed in getting satisfactory response to their request for exhibits. The mining counties have done very little indeed, and small effort is being made by them. The agricultural counties will doubtless have a creditable showing, but the prospects now are that the mining show will be far from satisfactory. If in each of the counties a few men would take up the work, collections of specimens, etc., could readily be made; but some one man or some few men must undertake the thing and make a start.

The Miner's Influence on Civilization.

Senator Stewart's Speech Before the California Mining Convention.

During the session of the State Mining Convention in this city last week, Senator Stewart of Nevada, who had been invited to be present, addressed the delegates as follows:

Mr. Chairman and Gentlemen of the Convention:—It is with great pleasure that I respond to your call. I am always at home and in good humor among the miners.

It is nearly 43 years since I commenced mining in this State. A generation has passed. Great changes have occurred. In early times mining was not only respectable, but it was the principal busiaess of the Pacific coast. To be a miner then was a passport to the best society that existed here. An honest miner became an honored man. Since then great changes have occurred. Mining has been depreciated and disgraced in the home of its friends. San Francisco was created by mining and maintained by mining. [Applause.] It is now exceedingly dull. Some have said that the dry-rot had even set in for want of mining.

For 30 years it was a well-established law of this State that the streams as well as the hills were dedicated to mining. Of course some injury was done by mining. An unnecessary clamor was raised after pretty much of the damage had already been done, and mining for gold was practically stopped. Any reasonable proposition to renew it was resisted not only with force hut with venom. No compromise, no matter whether harm was done or not, was entertained. The rule of reasonable use was trampled upon. It was denied that a party might use his own property, provided he did not materially injure his neighbor, but it was declared that he should not use it at all. That extreme was indulged in with regard to gold mining in this State.

You have locked up in these mountains a bed of gold gravel extending from 150 to 200 miles north and south, cutting through the tops of the ridges extending down from the Sierra Nevadas. You have just commenced opening that great gravel bed. Millions of money have been expended in tunnels and excavations and in ditches and canals to utilize it. While these millions were being expended the State encouraged it and endorsed it and rejoiced at it. When the money had been expended, then it was demanded by San Francisco and Sacramento that this property should be confiscated, and homes of the people of the mountains were destroyed—ruthlessly destroyed. I am not in favor of destroying the valleys; I am not in favor of injuring the harbor, but I am in favor of reason; I am in favor of such concessions on the part of the valleys and of the cities that the miners, too, may live, and that the world may have the benefit of the vast treasures that are stored away in your mountains. [Applause.]

I am glad to see the people of this State waking up to this, their paramount interest, and that there is a spirit of compromise; and a way will soon be devised whereby the mines can be worked and the valleys protected. There is no doubt about it. [Applause.]

It is within the range of science, it is within the range of practical engineering, and now you will accomplish it. The passion has passed away and the people of San Francisco and the valleys realize that they have as much interest in the mountains as they have in their own homes.

I am sorry that the people of San Francisco have not realized it earlier, and I am also sorry that the people of California have not realized that there is another class of mining important to the State, while we see vast buildings in this city erected by silver mining. I regret that anybody should come from this State desirous of destroying silver mining. I regret that this State should be represented as hostile to silver mining, because upon silver mining, as well as gold mining, the prosperity of this coast depends. [Applause]

It was the miners of the Pacific States and Territories that laid the foundation for this western empire; it was the miners and pioneers of this country that made it possible to obtain a sufficient metallic basis to give credit to the Government and save the Union. [Applause]. This vast region between here and the plains of Missouri would still be uninhabited if it had not been for gold and silver mining and tbe hardy race of pioneers that developed those mines.

Now, few persons realize the importance of mining. They even compare it to other minor pursuits. Mining for the precious metals is the most important avocation in the world. Without it civilization must cease. You can get farming land anywhere. Not one-fourth of the farming land of this earth is cultivated as it should be. Vast regions are untouched, but mining for both gold and silver is confined to narrow limits, and there can he no successful agriculture without gold and silver, no successful business of any kind so long as metallic money is the basis that measures all credit and all property. So long as money is a necessity to man, mining is the most important of all occupations.

If you trace the history of the world you can write the rise and fall of nations by the production of the mines. Give me a history of the mines and I will tell you the state of civilization at the time. No nation has ever advanced in civilization without gold and silver mines. Why is that? It is because money is as essential to civilization as is language. By language we interchange thought: by money we interchange commodities, the fruits of labor, and without such interchange there can be no civilization. In isolation neither language nor money is necessary, but individuals cannot become civilized alone. It is by the division of labor. It takes money to perform the various functions of civilization; it takes money to interchange the commodities and the fruits and labors of each. Upon money everything depends.

When Egypt built the pyramids, Nubia yielded up her treasure of gold and silver. When Babylon and Persia, the Egyptians, the Israelites and the Phœnicians prospered they had their mines of gold and silver. We now find where they had their Ophir and their other mining fields. The ruins still remain. When Greece was the cradle of learning for the world and when she made such an advance in art, science and literature that it is the pride of this generation and all other generations that succeeded to to imitate her, Xenophon recorded where she got her gold and silver. It was from the mountains of Thrace. When Rome was mistress of the world she had thousands of soldiers tearing down the mountains of Italy and Spain, and the ruins remain.

Then mining ceased and then came 1400 years of gloom and despair. The people had no money. They submitted to slavery. The dark ages prevailed. The feudal system was inaugurated. The lands fell into the hands of the few. They were morigaged. The people became weak and poor and they were destroyed. Civilization was blotted out. No reform, no progress, no invention was made while they had no money.

The New World was discovered 350 or 400 years later, and then Mexico and South America commenced pouring their treasures into Europe. The race had not been destroyed, but it was impoverished, and when new life was breathed into that country hy more money a new civilization sprang up and it moved on. Modern civilization was created, and was dependent upon the money that was furnished from the Western continent. For 300 years, from 1500 to the commencement of this century, the stream of gold and silver from the New World to the Old World was uninterrupted. Progress went on.

When the Spanish-American wars broke out and cut off the supply by stopping mining, a money famine ensued, and from 1800 to 1850 the people realized what the world is now realizing—falling prices and hard times. I remember that struggle. I was then a boy in the midst of it. I remember the wages of labor and the difficulty of paying taxes. Eight dollars a month for a strong workman on the farm was ample compensation, and it was sought for by the most enterprising. Hard times prevailed. Every invention was resorted to. Every theory of finance was discussed—high tariffs and low tariffs, every economical device, and the people were taught this and that. This went on until 1850 without relief.

Then came the glorious discovery nf gold on the Americao river. [Applause.] Following that came the discoveries in Australia, and the world was then set in motion, and the venerable historian, Sir Archibald Alison, who had been engaged for 50 years discussing various economics, declared that we were all mistaken, that it was the want of money that made hard times. In proving his assertion, he said that we find to-day (tbis was writing in 1853) that the free-trade States and the tariff States are alike prosperous. The world is moving on. There never was such a hoon extended to man as the California discovery. After that discovery, civilization advanced more in 25 years than it had in any century. [Applause.]

Talk about farming lands. Why, the little narrow space that you mined developed more farming land throughout the world than had been developed in centuries. It gave new life to everything. [Applause.] They penetrated the wilds of the West. Population spread like a prairie fire over the vast plains of Missouri. People had money with which to do something. They penetrated every clime, because they had money to purchase their ambition. It came from California and Australia. You went on furnishing the sinews of war so far as gold was concerned. They made you stop because you were destroying a few acres of farming land. Through your efforts you extended farming over millions of acres of uncultivable land and made it possihle for the emigrants of the Old World to make homes throughout the vast West and make an empire here.

During this time you penetrated the mountains and found silver mines. The Comstock was discovered and otherwise followed, and all the world rejoiced. I remember very well when I was first elected to the Senate. During the war, calling on Lincoln, he took me by both hands and said to me: "I am glad to see you. I am pleased to meet a representative of the Pacific States and Territories that enabled us to prnsecute the war, for without your gold and silver we would have been helpless. [Applause.] When gold-mining declined, we were particularly encouraged at the discovery of silver mines, because silver is always the money of the people."

We were held as benefactors. We had discovered these mines. We had invested our all in them—predicated upon what? Upon tbe use of silver from prehistoric times; upon the fact that 1,200,000,000 of people use silver and only 50,000,000 use gold—predicated upon the fact that silver was used as money before gold; predicated upon the fact that gold and silver were hoth money of the Constitution. We made the investments on these assurances. Your fellow miners spent their lives, their fortunes, and all they had was in silver mines. In an evil hour silver was rejected as money for the purpose of producing contraction and destroying one-half of the world's money. The first step in demonetization was taken by the United States by the passage of an Act to codify the mint laws, which omitted the silver dollar from the list of coins. The sixteenth section of the bill which omitted the silver dollar was never read in the Senate. It was smuggled through. I have charged it in high places, and will continue to

charge it and prove it from the record. Germany followed the action of the United States, and then the Latin Union also demonetized silver, aud silver was excluded from the mints the same as your gold mines were excluded from the rivers.

Silver bullion fell in price because the market therefor was cut off, and then the bankers and money loaners of the world discarded silver coin as reserves. There were at the time $7,500,000,000 of gold and silver coin in the world which was the basis of circulation and credit. Upon that sum rested the aggregate indebtedness of not less than one hundred thousand millions, which was payable in either gold or silver coin at the option of the debtor. As soon as silver bullion fell (for the reason of want of market and for no other reason, because there was no overproduction of it) they commenced discarding silver as reserves until silver is not considered a good reserve in Europe or America, except in France, which country has two hundred and sixty millions of silver which she pays out on demand. Our silver is reserve, but the administration will not use it as money.

By the demonetization of silver one-half of the reserves in which every debt has to be redeemed has been destroyed, and to-day instead of having $7,500,000,000, we have only $3,750,000,000 of metalic money upon which rests the credit and business of the world.

What has been the result? A fall in prices of 40 per cent. to correspond with the diminished basis. Farm lands in Europe and America, where there is no local cause to counteract it, such as emigration and building of cities, have fallen in fifteen years fully 50 per cent, and still they are going down. Money is growing so valuable that it cannot be used in enterprises. Your city is stagnant. Behold! It is a fair example of what the whole world is.

You will say that you have plenty of money in banks. There is where it goes when it is too dear to use in business. Falling prices discourage enterprise. A man who goes into debt sells money short. No prudent man will go into enterprises now, because while he is working his plant, property will fall and he will be ruined. There is too much money to invest in gilt-edged securities, but there is not enough money to move the country. Business is stagnant, millions of people are out of employment; everybody is hesitating and the gold ring is curtailing credit to increase their reserves. The business of every great financial institution in the world to-day is to curtail credit and increase reserves to save itself from bankruptcy. This is the situationi What we want is more silver. [Applause.] If all that had been produced of both during the last eighteen years had been untilized there would have been enough. In 1852 the output of gold and silver was over $200,000,000. $196,000,000 of gold alone. That was a sudden increase from 1848, when the aggregate was less than $40,000,000. It is said that that increase created great inflation. Did it do any harm? On the contrary, did it not bring forth the energies of all mankind?

From that time to 1873 the product continued to be about $200,000,000 a year. The year that silver was demonetized there was $81,000,000 of silver produced and $96,000,000 of gold. There was no excess then, nor has there been since. There has not been an increase of silver, and now the joint product of the two metals reaches $250,000,000.

Do not rely on statistics for information, for they are fixed for political purposes. They have no means of collecting statistics in Mexico and South America and in this country. If it were not for Wells, Fargo & Co., they would not get within a mile of it. There is no accumulation of silver bullion anywhere in the whole world, but the price is fixed by speculators with a view of degrading it and excluding it from the mints and making the gold which they own exceedingly valuable.

The money question is paramount to all other questions. Give the people plenty of money and they will take care of themselves. They will erect good schools and educate their children. They will take hold of the storehouse of nature and bring forth the hidden forces that exist in the elements. They will enslave the elements, not men. They will liberate the people and give them money to maintain civilization and business. They will make the lightning subservient to the use of man. They will make light, heat, water and all the other elements do the labor of man, if you will not cramp them. But when you reduce your independent farmers to tenant farmers, when you destroy the producing classes you stop civilization. The money kings will invent nothing but ways and means to rob the masses.

It is the producing classes, it is the miner, the mechanic and the scientist that unlock the storehouse of nature and let us progress. Why will man take from the miner and the mechanic the key whereby he can unlock these vast resources? Why stop mining? Why make war on the producing classes?

Let San Francisco take warning. If she continues to adhere to the gold standard and continues to make the gold standard smaller by closing up the mines, stagnation will follow and bankruptcy will be inevitable. [Applause.]

With your glorious State and glorious climate, with the vast resources that you possess, all the intelligence and energy of the people of the Pacific coast, you will make California the greatest State in the Union. If you are true to yourself and your manhood there is no such thing as fail. You will take the gold from those mountains, you will join us and restore silver to to the place it occupied as money under the Constitution before the crime of 1873 was committed. [Applause.] If the Pacific coast States and Territories will unite in one grand effort they can lift the cloud that hangs over the energies of the civilized world and give them new life. It will be like the great discoveries that happened in California and Australia, that made the heart of man glad and did more for civilization than any other event that has transpired in all the centuries.

Let us unlock the mountains and enjoy the heritage given us. Let us open our silver mines and restore that metal to its rightful place. Let the people have more money and you will have more prosperity and more wealth.

At the conclusion of the Senator's speech three rousing cheers were given in his honor.

Meadow Lake Mines.

The Work That Is Now Being Done In That District.

J. B. Gray writes to the Nevada *Transcript* the following letter concerning the Meadow Lake district:

Notwithstanding the signal failure that in almost every instance has attended the attempted development of the famous Meadow Lake mines, there are yet a few miners and prospectors who still have faith in the district and believe the quartz found there can be profitably worked. Considerable prospecting has been done there the past two or three summers by John Clark, Frank Cook and F. E. Shute, all of Sierra City. Messrs. Cook and Clark have put up this season a small prospecting mill with which to make a practical working test of the ore. The mill will contain four stamps and a Frue concentrator, and was, at the time this writer visited their works three weeks ago, about ready for operation. Power is supplied by means of a water wheel. The plant, though small, will be adequate for the purpose, and is put up in a very substantial manner, all of the carpenter work and much of the other work having been performed by the owners. The mill is situated on what has been called the Hercules mine, which is one of the locations held by Clark and Cook. They have two locations, the ledges varying in width from 5 to 50 feet and the ore averaging $10 per ton. On one of the ledges a shaft has been sunk to a depth of 113 feet. Considerable rock has been taken out in different places and several hundred tons are already available for crushing.

It is the intention of Messrs. Clark and Cook to crush the ore and pass the pulp over the Frue concentrator without using quicksilver in the battery or on the plates. Experience has demonstrated that most of the gold contained in the quartz is of a peculiar nature and refuses to amalgamate when quicksilver is used. There seems to be a fine coating or film upon the gold, which will not allow it to unite with the quicksilver, and consequently when this sort of amalgamation is tried the gold becomes scattered and the greater portion is lost. It is expected that the concentrator will not only save the sulphurets but will also catch most of the free gold that is found mingled with it, as is the case when tests are made by pounding the rock in a hand mortar and "horning" it out. Splendid prospects are obtained in this way. The concentrates saved at the Clark & Cook mill will be worked by H. H. Hartley, the veteran prospector and millman, who has been a resident of Meadow Lake nearly 30 years and who claims to have a practical process for working the concentrates at a profit. What his process is nobody knows. It is a secret with himself and he will not even have it patented. By crushing the rock in the manner described and the concentrates treated by Mr. Hartley's process, they expect to make their mine pay; at any rate they will find out whether it is a paying proposition. If so, the capacity of the mill will be increased next year. On the other hand, should it prove a failure, they probably will try the cyanide process. They are determined to give the ore a thorough test by all the latest and most improved methods. We trust their efforts will be crowned with success, which means a fortune not only to themselves but to all others interested in the district, and a revival upon a more certain basis of some of the old-time activity in that section.

H. H. Hartley, the pioneer of that part of Nevada county, is the principal mine owner in the district, many of his locations being covered by patents. He is owner of the Excelsior mine, the largest and richest ledge in the camp, running from 10 to 50 feet in width, the ore paying by mill process from $8 to $20 a ton. It has been prospected by numerous cuts, shafts and tunnels. The Excelsior mill and reduction works, in the construction of which over $100,000 was expended first and last, belongs to Mr. Hartley, and it is here that he works, single handed and alone, crushing and reducing ore from his mine. Of course he cannot accomplish much working this way, but he claims that he makes it pay and is contented with the world.

"Old Man" Hartley, as he is familiarly called, has passed nigh on to 30 winters within the snowy fastness of that wild and rugged country.

F. E. Shute is doing some prospecting in the district for Sierra City parties, and has made two or three locations that promise well.

George Clark, brother of John, is living at Meadow Lake and is engaged in prospecting.

O. S. Holbrook, another old-timer in the camp, is still there. He has several ledges located and goes up every summer to look after them—the boys say to see that no body takes the claims off.

In examining the various mines, ledges and prospect holes that abound in Meadow Lake district, we were shown the famous Pacific mine, now called the Diamond. The mine was discovered and located in 1865 by John Kistle of this city. Eighteen tons of the ore taken from this ledge were hauled from Nevada City that year by ox teams, and crushed by the old Charonnat mill at Canada Hill. The first five tons yielded $56 per ton, the remaining 13 tons paying $47 a ton. In those days no sulphurets were saved. It cost $30 a ton to have the quartz hauled here. Kistle and his partners afterwards sold the mine to James Blood of Plumas county, who expended a large sum of money in endeavoring to develop the property, but without success. A large three-compartment shaft was sunk about 100 feet, the rock being hoisted by means of a large windlass operated by hand power. After getting down on the ledge, the quartz could not be made to pay, nor did it prospect anything like it did near the surface where Kistle & Co. took out their rock. It was decided by experts that the gold could not be extracted, owing to the ore becoming more and more refractory as a greater depth was reached. A mill that had been erected failed to save the gold, and a heater was put in to heat the water used in the batteries, hoping thereby to facilitate amalgamation. This experiment necessitated the outlay of considerable money, and nothing availed. Blood, like hundreds of others, finally abandoned the mine, and no work of any note has been done on it from that day to this. There are probably 300 tons of ore piled up near the mouth of the shaft.

Opinions differ as to the worth or worthlessness of the mines of Meadow Lake district. Experienced metallurgists cannot agree regarding it, while old miners and prospectors have numerous pet theories. Some hold that there is no gold in the quartz to speak of after a certain depth is reached. Others claim that the gold is there but is so mixed with base metal that it cannot be profitably worked by any of the ordinary methods employed in the treatment of refractory ores. Dozens of processes have been tried, but so far no means have yet been discovered by which the ore has been worked to any extent at a profit. Samples of the quartz have been sent all over the world to different reduction works, even to the far-famed smelting works at Swansea, in South Wales. Satisfactory returns were received from this latter place, we believe, but the cost of shipment was too great to make it a paying venture.

It may be that Clark & Cook have struck the right system and that, with the aid of Hartley's process in working the concentrates, they may make the ore pay. Or it may be that the new cyanide process will solve the problem. In either event we hope that their efforts will prove successful. There is plenty of rock in sight in Meadow Lake to keep 20 big mills running, and once a profitable way of working it is found it would not be long before the mills would be in operation.

Working the W. Y. O. D. Mine.

GRASS VALLEY, Nov. 7, 1892.

TO THE EDITOR:—In your issue of Nov. 5th your correspondent stated that a year ago the W. Y. O. D. mine was a prospect, and that capital and intelligent enterprise took hold of it and made it one of the big mines. The fact is, this has not been a prospect for more than two years. Over one year ago there were four dividends of five cents per share. In the present year there have been six dividends of ten cents per share. On the 15th day of August, 1892, there was in the treasury $15 000, which would amount to five monthly dividends of ten cents per share were it paid that way. There is also as good a plant above and below ground as on any mine in the State, and all paid for. Allow me to report that the intelligence which started this mine in 1886, from the grass roots down to the depth of 940 feet, did all the management of the mine up to the 15th of August, 1892, and they intend to hold their record against any who try to claim it.

If those who own and manage it now can show the same energy and use the same judgment the starters did, this ought to be one of the biggest of mines for an unknown time. Yours respectfully, THREE OF THE ORIGINALS.

Mr. Aaron's Articles Appreciated.

FORBESTOWN, BUTTE CO., CAL., Nov. 9, 1892.

TO THE EDITOR:—Having seen one or two comments upon Mr. Aaron's articles in the PRESS which show anything but a proper appreciation of them, I take the liberty of saying that I, for one (and doubtless there are many more), feel that all the PRESS readers are actually benefited by his contributions.

The total lack of dogmatism, coupled with genuine worth of the information imparted, is almost characteristic of Mr. Aaron's papers. His articles upon the cyanide process are, to my mind, unexcelled for lucidity, and invariably make me wish for more, especially of the chemistry of the process. Sincerely, M. H. B.

THERE are 300 men at work on the great Pine Ridge flume, Fresno Co., or on the mills which supply lumber to the flumemakers. The dam across Stephenson creek, about a mile below Bennett's mill, is built in a narrow gorge of the creek, between two points of hills. It is faced with large blocks of granite, in the manner of two walls across the channel, and between them loose rocks are piled. The upper side of the dam will be faced with lumber. When the dam shall be completed, it will cause the water to collect above in a reservoir that will cover about 1200 acres, at an average depth of 30 feet. Work is being pushed forward under the superintendency of Mr. Shaver. The flume is double, the V flume that will carry the lumber being above the large flume which will transport the water. The large flume for the water will be dropped when the head of Dry creek is reached. The water will flow down the channel of the creek from that point. But the V flume for the lumber will be continued to Fresno, and will be finished next season. The mills on Pine Ridge, that usually close before this time of year are still busily at work cutting lumber for the flume. The Bonanza mill, owned and operated by C. D. Davis, cuts from 40,000 to 50,000 feet a day. The Bennett mill, a mile beyond, is also running at its full capacity. All is in operation and everybody is busy.

W. S. KEYES, mining engineer, vice-president of the California State Mining Bureau, left on the steamer of the 18th to investigate a system of mines near Rosario, in the State of Sinaloa, Mexico. Mr. Keyes' address until February next will be care of agent Pacific Mail S. S. Co., Mazatlan, Mexico.

EXTENSIVE prospecting has been going on in the foot hills of the Siskiyous, and some very promising finds have been made on the California side of the divide, says the Yreka *Journal*. There can be little question that the hills are full of mineral in every direction awaiting discovery.

A PROPOSITION is to be considered as to adding a labor employment bureau feature to the State Miners' Association, so as to provide superintendents with competent men and give the working miners a place where they may look for work.

Mechanical Progress.

The Brown Segmental Wire-Gun.

Mr. N. B. Wittman, at a recent meeting of the American Institute of Mining Engineers, read a paper, of which the following is an abstract:

The system consists essentially of the subdivision of the inner core or tube of the gun, which takes up the initial compression into longitudinal segments of such size that a higher physical condition and degree of special elasticity may be set up therein than it is possible to produce in the larger masses of metal heretofore used for the tube of the modern high-power cannon. The process consists in winding layers of square steel-wire, subjected to a constant tension of 130,000 lbs. per square inch, around these segments, which, when so held together, form the tube of the gun. A lining-tube may or may not be used.

The steel segments used in the gun now under construction are 18 feet 4 inches long and 3 inches thick at the breech, from which they taper to 0.8 inch at the muzzle. The physical condition of the segments has been determined hy a test piece, cut from each end of each segment, which showed the following characteristics: Tensile strength, 165,000 lbs. per square inch; elastic limit, 105,000 lbs. per square inch; elongation at rupture, 14 per cent in two inches. They are of crucible chrome-steel, made by the Carpenter Steel Works of Reading, Penn. The wire which holds them together has 0.005 square inch sectional area and is wound under a constant tension of 650 lhs. on each strand, equivalent to 135,000 lbs. per square inch. The winding has been done by a machine designed for the purpose by Mr. J. A. Brown, the inventor. It consists essentially of a windlass and series of rollers, which act as a clutch, hy which a weight is attached to the wire, and which is fitted with a friction-brake, automatically regulating the speed of the passage of the wire through the machine. This speed being kept the same as that of the winding, the weight is thus held at a fixed height, insuring a constant and absolutely uniform tension upon the wire.

The wire used has the following physical qualities: Tensile strength, 250,000 lbs. per square inch; elastic limit, 200,000 lbs. per square inch; torsional strength, 30 full turns in eight inches before breaking. Following the curve of maximum pressure, the segments are wound at the breech with 33 layers of wire, making a total thickness at that place of 2.31 inches of wire, and a layer is dropped at each ten inches, so that there are but ten layers at the muzzle, giving at that point a thickness of 0.71 inch. Altogether, 3256 lbs. of wire were used, equivalent to a single strand extending in a straight line for 37 miles.

The wire was anchored at each end by a special device invented by Mr. Brown. As no flow of metal will occur below the elastic limit of the steel of which the segments are made, enlargement of the bore will not take place below a pressure of 94,000 lbs. per square inch, this being 94 per cent of the elastic limit, if that limit be taken at 100,000 lbs. per square inch (the minimum obtained from any one of the test-pieces). As the pressure between the segments at the surface of the bore, induced hy winding, is 100,000 lbs. per square inch, it will require a powder pressure of 63,200 lbs. per square inch to reduce this compressisn to zero. In order to demonstrate practically the truth of this proposition, a stub representing the powder-chamber of the gun was made and encased in a steel-jacket, into the ends of which heavy plugs were screwed, entirely closing the powder-chamber, with the exception of an aperture 0.2 inch in diameter, to serve as a gas-vent and firing orifice. This has been fired repeatedly, with a charge which generated in all cases over 50,000, often over 60,000, and on four occasions over 66,000 lbs. per square inch, and in every instance without the slightest indication of displacement of the segments or enlargement of the bore.

The trunnions are attached to a trunnion-jacket, which is screwed to the breech of the gun. The major portion of the longitudinal thrust produced by firing is taken up by this jacket, and not oy the inner tube. This is one of the special features of this system of construction. The chase of the gun—that is, that part in advance of the trunnions—is protected from the effect of small-arm and machine-gun fire by a steel-jacket shrunk upon it. The breech-hlock presents some novel features in the way of simplicity of design and the maintenance of efficiency, in view of probable rough usage in actual service. A continuous thread is used, and when the block is thrown open for charging, a latch locks it, so that it cannot be turned until it enters the breech. This insures proper centering of the threads under all circumstances, and a consequent minimum of wear. The service-charge of a gun of this size, made in the usual way by shrinking steel hoops over a central tube, is llmited to a powder-pressure of 37,000 lbs. per square inch, while in the Brown gun the ordinary charge will generate 50,000 lbs. pressure, and 60,000 lbs. per square inch can be reached with entire safety.

How Wire Glass is Manufactured.

Last week reference was made in the *American Manufacturer* to the factory at Tacony, near Philadelphia, for the manufacture of wire glass. It appears that the process and machinery employed were invented by Mr. Frank Shuman of Philadelphia. A glass rolling-table has a three-roller carriage moving over it running on the side ledges. The glass is rolled out upon this table, the ledges regulating its thickness. Two of the rollers are smooth; the central roller has a series of grooves running around it. Between the leading roller and the corrugated roller a slide is placed for the reception of a sheet of wire gauze. A proper quantity of melted glass is poured out upon the table, the hot sheet of wire gauze is placed in its carrier, and the roller carriage is started. As the carriage progresses a little, the wire is dropped. The first roller has rolled out the glass. The wire gauze strikes the partly fluid glass, and is drawn under the corrugated roller. This seizes it, and by its corrugations, forces it into the pasty glass to the required depth. The compound mass then goes under the third roller, where it is rolled smooth, and the operation is completed. The sheet is now annealed in the usual way, and is ready for use.

By modifications in the apparatus, various products may be obtained. The wire gauze may be heated so hot as to receive a corrugated contour, which it retains in the glass. It may, on the other hand, be worked at so low a temperature as to lle quite flat in the finished product. The corrugated roller may be adjusted to give it any desired depth in the glass. I: is stated that sheets of wire glass six feet long, two feet wide and three-eighths of an inch thick have been rolled at the experimental plant in 35 seconds.

It is now announced that the doors, windows and ports of the new cruiser New York, at Cramp's shipyard, shall be fitted with wire glass, a newly-devised material for the manufacture of which large works are being erected at Tacony. It is held that as a result of the wire netting in the glass, the shock and jars resulting from the discharge of guns or collisions do not shatter the pane, but leave it intact.

Compound Engines.

The idea has been advanced that the compound engine, to be efficient, need not be in one machine, nor necessarily attached to the same work. When a sufficiently high pressure is available and suitable conditions as to work exist, two entirely separate engines, whose sizes bear the proper relations to each other, may, according to *Power*, be run together upon the compound principle. It costs but little more to make a pound of steam at 120 pounds pressure than at 60, and obviously the higher pressure steam is capable of doing more work.

Suppose an engine has been running at 60 pounds pressure, which pressure is best adapted to the range of expansion in that cylinder under the conditions of its work. Suppose now it is found possible to carry a pressure of 120 pounds. Another engine can be run from the hoiler at this higher pressure and exhaust at a pressure of 60 pounds into a receiver, which can take the place of the boiler that supplied that pressure to the original engine. The problem is to so proportion the cylinders that the low-pressure cylinder shall take as much steam out of the receiver as the high-pressure cylinder delivers to it in a given time.

Where both engines are connected to the same load this is easily done, for, supposing the load to be lessened, the first cylinder will take less steam from the boiler and deliver less to the receiver. If the point of cut-off on the low-pressure cylinder is fixed so that it takes the same volume of steam from the receiver as before, the pressure in the receiver, and hence the initial and mean effective pressure in the low-pressure cylinder, will fall, or if the cut-off in the low-pressure cylinder is controlled by the governor it will take less steam, preserving a uniform receiver pressure, in either case reducing the work done in accordance with the demand of the lesser load.—Manufacturers' Gazette.

Scientific Progress.

New Chemical Processes.

Mr. Ludwig Mond has published particulars of a method nf utilizing the chlorine which has hitherto wasted in the ammonia process of manufacturing caustic soda. The process is extremely ingenious. The preliminary treatment of the brine with ammonia and carbonic acid leaves the manufacturer with bicarbonate of soda, which crystallizes out, and with a solution of ammonium chloride, or sal ammoniac, as it is commonly called. Hitherto the ammonium-chloride solution has been boiled with lime, in order to recover the ammonia, the resulting products being gaseous ammonia and chloride of calcium. Up till now, the latter has been allowed tn run off, carrying with it, of course, the chlorine derived from the brine (chloride nf sodium). The new system begins when bicarbonate of soda and ammonium chloride have been formed. The first having crystallized and been removed, the second is frozen by means of liquefied ammonia until it also crystallizes. It is next dried and sublimed, the vapor being passed over magnesium oxide, which parts with its oxygen to form water with some of the hydrogen of the ammonium chloride, seizes the chlorine, thus becoming magnesium chloride, and allows free ammonia to pass on. Up to this point, therefore, the operator has recovered his ammonia as before, but is left with magnesium chloride instead of calcium chloride. The next step is to pass hot air over the magnesium chloride, the result being that that compound is again converted into magnesium oxide, while the chlorine is set free, and is turned into bleaching powder in the usual way, but at what cost we are not at present informed.

The discovery of a new and simple process of producing caustic soda, chlorine, and other chemical products direct from the brine by electricity is also announced. The problem is one which has long occupied the close attention of chemists and scientists. The chemical fact that caustic soda and chlorine can be produced from a solution of common salt by means of electricity has long been known, but hitherto the process has been too costly to enable it to be worked on a commercial scale. The great difficulty has always been found in regard tn the expensive anodes required for the decomposition of the brine, and which in turn were themselves rapidly disintegrated by the absorption of the nascent chlorine given off during the process. Another difficulty was to prevent the recombination of the products when once they had been separated. Mr. James Greenwood, the eminent electrochemist, has patented an important new departure by which both these difficulties are claimed to have been overcome. He has invented a compound anode of even greater conductivity than those hitherto employed, but treated in such a manner as to render it nonporous and unattackable by the chlorine, and therefore much longer lived, while he has also devised a patent diaphragm which renders the recombination of the products impossible. The process has been worked on a commercial scale with success for some time in London, where an experimental plant was laid down. A still larger installation is at present under construction near the metropolis, where the working of the process will be subjected to the most rigid tests for a considerable period. Should these prove satisfactory, arrangements have already been completed for the erection of a very large plant for the manufacture of caustic soda and chlorine, or bleaching powder, by the new method in Germany. The process has been favorably reported upon by many eminent electricians and electrochemists, including Dr. G. Gore, F. R. S.; Mr. W. H. Preece, F. R. S. (electrician to the General Post Office); and Messrs Cross & Bevan, consulting chemists, London.

DECORATIVE GLASS.—The use of decorative glass in modern buildings is becoming more and more widespread everyday. Stained glass is used not only in transoms and dome lights, but the ordinary clear glass used in windows, doors and partitions is either embossed by an acid process or etched by a sand blast, creating a new world of decorations. There is the ordinary ground glass on which one can write with a pencil, but this method of decoration has been superseded hy the silver embossed process, which renders the glass at once obscure and translucent, and which will not receive pencil marks or finger stains. The decoration consists of scroll, diamond, square and oircular repeats, decorated borders, monograms and numbering and lettering of all kinds for commercial purposes. A panel of chipped glass that seems to be sliced from the irregular face of a crystal rock is a brilliant accompaniment to its decorative surroundings.

Spectrum Analysis of Planetary Atmospheres.

Mr. Jansen, the well-known astronomer, is, according to *La Lumiere Electrique*, at the present moment engaged in some highly interesting researches on the constitution of the atmosphere of Venus, and in these researches the application of the electric light plays a most important part. The recent discoveries made with regard to the planets Mars and Jupiter, have invested the subject of the constitution and nature of other planets with fresh interest; and it is clear that if the presence of water vapor could be proved in the atmosphere of Venus, we should be justified in concluding that seas and rivers exist in that planet, and that the organization of that brilliant heavenly sister of the earth is similar to that of our own planet.

The basis of these protracted and difficult researches Is the well-known property of electric light of presenting brilliant rays only, and not a single dark ray. Starting from this assumption, Mr. Jansen passed a powerful ray of electric light through a tube containing a considerable quantity of water vapor, heated to a temperature of 300° C. By using a tube of 170 feet length, he succeeded in accurately determining the rays of water vapor. In possession of these valuable results, he profited by the two oppositions of Venus which took place a few months ago, in order to study the light of that planet. The aim he had in view was to determine whether in its characteristic rays those rays could be found which indicate in an unmistakable manner the presence of water in the state of vapnr. The exceptionally favorable position in which the planet then was enabled Mr. Jansen to carry out his investigations with a rare chance of success, but for all this he could not arrive, in Paris, at entirely conclusive results. The reasnn for this is not very far to seek. Although the star was at a considerable height above the horizon, its light traversed a part of the atmosphere charged with water vapor, and consequentlyshowed in the spectroscope the characteristic rays of that substance. It was therefore difficult to dlstinguish in the total effect, as shown by the spectroscope, what portion of it belonged to the planet and how much to our earth.

Now, matters are different on the top of Mont Blanc, where all the watery vapor contained in the upper layers of the earth's atmosphere is reduced to the form of snow, a form in which it does not effect in the least the nature of the light rays. This is the reasnn why the learned astronomer attaches so much importance to the erectlon of a large observatory on the top of a mountain, which, for a long time, had been considered inaccessible. The work of construction is being actively pushed on, under the superintendence of Mr. Jansen himself, and the observatory, when completed, will doubtless enable him to bring to a successful issue the researches which he commenced at the Meudon observatory and which, as already stated, are based upon a characteristic property which electric light possesses in common with sun light. It is known, in fact, that none of the innumerable rays we perceive in its spectrum belong to it; they are all produced by metals held in suspension in the photosphere. In a similar manner the dark rays of electric light are entirely due to metallic substances contained in the electrodes, and have really nothing to do with the light itself. However this may be, it is, thanks to the employment of the electric light, that we have arrived at the conclusion that the various hodies of the solar system are of identical composition. This important conclusion naturally leads to the idea that the different planets, at least those which, like Mars and Venus, show so much similarity with ours, are covered with plants and animals differing from those with which we are familiar no more than plants and animals of the torrid zone differ from the glacial zone. As soon as Mr. Jansen has finished the researches in which he is at present engaged, we shall give an account of the ingenious apparatus devised by him for making an exhaustive study of the spectrum of watery vapors. It is not sufficient, as we have seen already, to trace more or less slight indications, showing the presence of substances to be found in our own atmosphere. The proof is not complete unless we can perform a sort of quantitative analysis, so as to determine not only the presence but also the quantity of the substances contained in the planetary atmospheres. Then, and then only, will the man of science have a safe guide in regions where hitherto poets and dreamers have held undisputed sway.

DUNCAN'S
Practical Surveyor's Guide.

A New, Enlarged and Revised Edition.

JUST READY.

The Practical Surveyor's Guide, containing the necessary information to make any person of common capacity a finished land surveyor, without the aid of a teacher. By ANDREW DUNCAN, Land Surveyor and Civil Engineer. A new, revised and greatly enlarged edition. Illustrated by 72 engravings.

In One Volume, 12mo., 214 pages, price $1 50. By mail, free of postage to any address in the world.

PREFACE TO REVISED EDITION.—As shown by the constant demand for it, "The Practical Surveyor's Guide" still maintains the popularity and reputation it has, for so many years, enjoyed. The issue of a new edition having become necessary, a considerable amount of new matter has been added in order to make the work still more useful to the reader. No changes, except necessary corrections, have been made in the original text. The greater portion of the new matter has been translated from "Katechismus der Feldmesskunst," by Dr. C. Pietsch, a very popular German work which has passed through five editions. In making these additions, the aim of the author of the original work—to prepare a work sufficiently concise and instructive in the several details—has been constantly kept in view. It is hoped that this new edition may prove of value to surveyors, professional and unprofessional, in giving them the needed information in a clear and simple manner, unburdened with unnecessary matter.

ABSTRACT OF CONTENTS.—Introduction; Object of Surveying; What a Survey Should Include; Definition of Points; Determination of a Straight line and of a Plane Surface; Map of a Survey; Scales According to Which Maps of Surveys are Drawn; Instruments for Measuring Distances and Their Use; Instruments for Setting out Right Angles, and Their Use; Survey of Smaller Tracts with the Assistance of the Previously-Described Instrument; Problems; Trigonometrical Surveying; Tables of Surveys; Systems of Rectangular Surveying for Surveying the Public Lands of the United States; Index.

WE HAVE ALSO RECENTLY PUBLISHED

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages.

Price $1 50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury. Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo. 367 pages.

REMINGTONS

AT THE

COLUMBIAN EXPOSITION.

The Remington Secures the Exclusive Contract.

The Committee of Ways and Means of the World's Columbian Exposition has awarded to Wyckoff, Seamens & Benedict (Remington Standard Typewriter) the contract for furnishing all the writing machines to be used on the Exposition Grounds during the Fair. A large number will be placed at convenient points throughout all the buildings, and are intended for the accommodation of the general public, representatives of the press, and the officers of the Exposition.—*Chicago Sunday Herald, Aug. 7, 1892.*

The World's Fair Commission already uses over **100 REMINGTONS** in their own work.

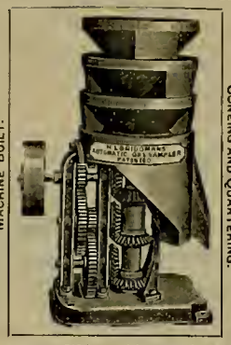
H. L. BRIDGMAN, PATENT ORE SAMPLING MACHINE,



AUTOMATIC IN ACTION. RELIABLE IN RESULTS. IT IS THE ONLY FIRST-CLASS ORE-SAMPLING MACHINE BUILT.

THIS MACHINE FURNISHES DUPLICATE SAMPLES, AND SAVES THE EXPENSE OF MIXING, CONEING AND QUARTERING.

Among users of this machine are Cia Metalurgica Mexicana, San Luis Potosi, Mexico; Chicago Copper Refining Co., Blue Island, Ill.; Hemenway & Brown, Antofagasta, Chile; Francisco M. Coughlan, Catorce, Mexico. It should be used by Lead, Copper, Zinc and Iron Works, Concentrating and Leaching Works, Gold and Silver Mills, and Sampling Works. Investigate it. Send for Catalogue.

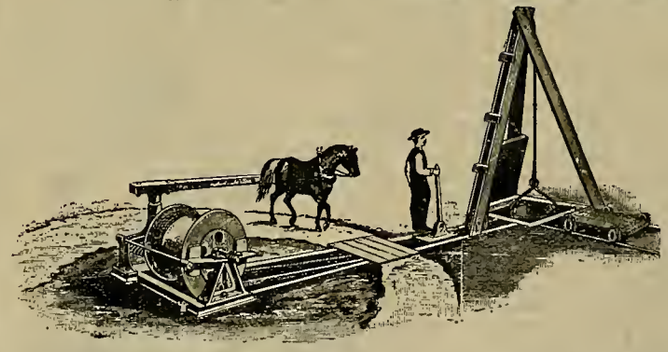
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not effected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

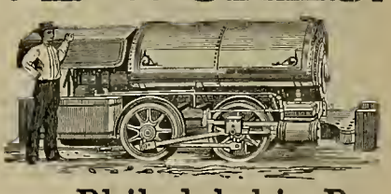
Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!



Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Electricity.

A Perfect Overhead Electric Construction.

At the recent convention of the American Street Railway Association, at Cleveland, Ohio, a report on "A Perfect Overhead Electric Construction" was read as follows by Charles H. Smith:

Iron or steel poles have proved to be the most desirable. I would therefore recommend the following: The poles to be of tubular iron, 32 feet in length, and made in three sections, in the usual way. The lower section should be at least seven inches in diameter, and the other two sections six inches and five inches respectively. The poles should be set in concrete and at least six feet in the ground, and should not be more than 125 feet apart. The top of the pole should have about two per cent of rake away from the curb, and should be fitted with a suitable pole clamp, so that the span wire can be easily adjusted to the required height, which should be 22 feet above the track. On top of the pole should be a malleable iron cross-arm to carry the feeder-wires and guard-wire spans. This cross-arm should be insulated from the pole by means of a wooden plug inserted in the top of the pole. The insertion of the joints of the pole should be at least 18 inches, and the joints should be made solid throughout their entire length by means of shims or other contrivances.

If these joints are not properly made, the poles will not stand the strain. For curves, or extra strain, there should be larger poles of the same make.

Span wires should be of No. 4 B. W. G. silicon bronze wire, and should be fastened to pole clamps by means of insulated turn buckles. Great care should be taken in insulating these turn buckles from the poles.

All well-built lines should be sectional, and the trolley-wire should not be of too great a size, as it would then call for clumsy supports. As it is not the main-current wire, it can be of a smaller size. I would therefore recommend No. 4 B. W. G. silicon bronze wire, which affords sufficient carrying capacity, and has great strength and durability.

Sections should not be of a greater length than two miles, and should be separated by trolley-breakers, of which there are now a number of good ones in the market. In cities and villages, where there is a great liability of fires, it would be advisable to put trolley-breakers at shorter intervals. Trolley-wire hangers and pull-off brackets should be of the lightest make possible, and still have the required strength and the very best insulation. There is a variety of such hangers and brackets now in the market.

As it is important to have as small a number of joints as possible in the trolley-wire, it should be put up in mile lengths, and twisted splice joints should be made, and brass cone-shaped tubes slipped over the wire before the splice is made. After completing the splice, the larger ends of the tubes should be brought together over the splice and a little solder dropped through a small hole made in the tubes for that purpose, in order to keep the joint in place.

Overhead switches or switch-pans should be avoided, if possible, as they become a source of great annoyance. I would strongly recommend a double-trolley-wire for a single-track road.

Great care should be taken in erecting the guard-wire spans. They should be properly insulated from the cross-arm by means of a strain insulator, or something equally as good, and should be of at least No. 6 best galvanized-iron wire. There should be two guard wires over each trolley-wire, at least three feet apart and four feet above the trolley-wire. The guard wire must be well insulated from the guard spans; in case of other wires falling, this would he of great importance.

Pull-off and anchor-guy-wires, or other wires for the same purpose, must be of the very best material and of at least No. 8 galvanized-iron wire.

Feed-in taps must not be more than five poles apart and should take the place of the trolley-span-wire at the point. They should be of at least No. 0 insulated wire.

The trolley-wire being sectional, it is necessary to run a feeder-wire to each section. I would therefore recommend that the feeder-wire he at least 30 per cent larger than the occasion demands. It will be found that this is money well invested. The insulation on the feeder-wire should be the best that can be procured, and I would advise using locust or iron pins with mica insulators, or something equally as good, for the purpose of fastening the feeder-wire to each pole, and great care must be taken to protect it from trees and other obstructions.

A cut-off box should be located on the pole at each trolley-breaker, and should not carry a fuse. It should have the same wire running through it as there is on the outside. The fuses should be at the station, with ampere meter and cut-out switch for each section; then, in case of trouble on any section, the location can be easily seen and that section cut out, if necessary, until repaired.

Lightning arresters are of great importance on the line, and I would strongly recommend using them at least every thousand feet. They can easily be attached to the poles, and can be protected by means of a box.

In conclusion, I would say that no matter what expense is incurred for material, or care used in constructing, a good line cannot be insured without a thorough dally inspection.

It is to be hoped that in the near future a perfect overhead electric construction will be realized in some of our large cities, for the example or fact will be of much more value and interest than any paper on the subject.

New Westinghouse Lamp.

The *Western Electrician* illustrates the new Westinghouse incandescent lamp, of which so much has been said since the decision of the United States Circuit Court of Appeals in New York, upholding the validity of the claim of the Edison General Electric Company as the possessor of the first patent on a practical incandescent lamp. Mr. Westinghouse has met this decision by asserting that he has a new lamp "which not only does not infringe the Edison patent nor any of the patents of the other companies, but is fully covered by patents of our own."

There is no brass at the base of the lamp the butt being of glass. No platinum is used for the leading-in wires, its place being taken, it is said, by an alloy which is claimed to be a satisfactory substitute, and to have a proper coefficient of expansion. The nature of this wire composition is, of course, kept secret. The lamp is a separable one; that is, the filament can be removed and the bulb used over again. This is accomplished by attaching the burner to a ground-glass stopper, which is tightly inserted in the bulb. Then, after the air is exhausted, the lamp is sealed by a peculiar brownish paste. To remove the filament, the lamp is soaked in hot water, which softens the sealing compound and allows the removal of the stopper, which, when refitted with a new burner, can be replaced in the manner described, it being necessary, of course, to again have recourse to the pumping process.

The connection with the socket is made directly through the leading-in wires. The base is of porcelain, and is of extremely simple construction. The binding posts are connected to two spring clips, which are arranged to receive, in the middle portion, the two wires leading from the lamp. Contact is made by turning the lamp so that the wires are at right angles with the spring clips, which are thus forced farther apart, one wire pressing against each strip. A quarter turn of the lamp places the wires parallel and between the strips, which spring back to their normal position, and the light is thus extinguished. The lamp is not screwed into the shell of the socket, but simply pushed in, being retained by springs. It is asserted that that these lanps can he sold at wholesale for 30 cents each.

A PHYSICAL EVIL OF ELECTRIC WELDING.—A section of the men employed at the Kolomna Iron Works, situated near Moscow, has lately had some unpleasant experiences with electric welding, which, with the aid of 500 accumulators, is there practiced according to the Benardos process. While engaged on the trying work, the artificers' eyes were, of course, protected by tinted glasses, but the skin being exposed, the following symptoms were manifested: Burning sensation on the skin and in the eyes; in from three to four hours, discharges from the nose and the eyes; three to four hours later, a dry cough; four to five hours later, swelling of the skin and development of other symptoms; eight to ten hours from the commencement of the disorder, continuous irritation of the eyes, lasting from four to six hours; and finally, coloring of the skin. Then the various effects ceased, and the skin began to peel. On the third day the cuticle had completely decorticated, and by the sixth all the painful symptoms disappeared, but for weeks afterward the skin remained colored. These effects, it would seem, are exactly the same as those which are induced under scorching by the sun. The hest protection which can be afforded the workmen against the evils mentioned, Mons. Maklakoff, the manager of the works, believes consists in a covering of yellow waxed cloth or red and green veils. The electric welders, however, object with characteristic Russian dignity to the assumption of the feminine facial appendages, alleging that, although they may improve the general appearance of the fair sex, they will rather excite ridicule when they are worn by stalwart workers.—Iron.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Cricibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Mines Revived and Miners Enriched

By the wonderful **MacArther-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

DENVER WORKS: On the P. & R. G. R. R., near the Broadway Electric R. R. Depot.

OLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Gro Grande, San Bernardino Co., Cal.; Champie's Mines, Humbug District, Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,

P. O. Box 936. Gen. Mgr. and Secretary.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

—MANUFACTURERS OF—

BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,

Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.C.° BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the **Morgan Crucible Co.,** Battersea, England. Also for **E. G. Denniston's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

GAS WORK A SPECIALTY.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

M. A. GRAHAM,

Inventor and Manufacturer,

Useful Information.

Allard's Copper-Tempering Process.

Ferdinand Allard's method of tempering copper appears to have soon attracted the notice of our naval and military authorities, says *Iron*. Major-General Herbert, the commander of the Canadian militia, and other officers have examined the cutting tools made by the Quebec blacksmith's process, and they are stated to have expressed surprise at the wonderful edge and hardness which had been attained. It was at the General's suggestion, offered in view of the possibility of the discovery being utilized in connection with the armoring of British war vessels, that the inventor despatched a sheet of his hardened copper, 1¼ of a line in thickness, to be tested under the direction of the Lords of the Admiralty, who are alleged to have evinced great satisfaction with the result of the experiments which were conducted with the metal. At a preliminary trial of similar sheets at the Canadian rifle-ranges, the bullet, fired from a distance of 40 yards, was, it is said, shattered into fragments by its first impact with the hardened copper. On the second essay the missile, striking the plate more fairly, was completely flattened, but it remained embedded in the sheet, which it merely dented a trifle, without causing the slightest cracking. Mr. Allard's friends and supporters, who are now numerous, declare that all the tests so far made have proved eminently successful, and that the inventor, amongst other things, has made by his method a copper razor equal in edge and temper to the best article that Rodgers can turn out. How the French-Canadian artificer discovered the secret of his process is related by himself. The narrative has its corollary in the story of Bernard Palissy. "Thirty years ago," Mr. Allard says, "when working at my trade in the United States, I heard a comrade in the same shop remark that the man who could rediscover the lost art of tempering copper would make a fortune. Ever afterwards this saying haunted my mind, and for over 30 years I sought the secret in vain. I made thousands of experiments which ended only in failure and disappointment. A hundred times I vowed that if the next trial failed I would abandon the search, which was wasting my limited means, and seemingly proving a veritable will-o'-the-wisp. At last I decided to make one more attempt, and if that did not succeed, to give the whole thing up forever. An idea of a new combination suddenly occurred to me, and victory was at last mine."

Horses Should Wear Light Shoes.

Horses are commonly made to carry too heavy shoes. The shoe is designed merely to protect the hoof, and the lighter it can be made and still serve its purpose, the better for the horse. Horses that are devoted to farm work, and on land where there are few or no stones, may dispense with shoes, except while the ground is frozen. This would be of great advantage to the horse, to say nothing of the saving in the horseshoer's bill. But most horses require shoeing, and the shoes worn are heavy iron ones. Steel shoes can be made lighter, will wear longer, and the first cost is not so much more that it need prevent their being used. Light horses and driving horses should always use them. For horses of 1,100 pounds weight, and with well shaped, upright feet, the fore shoes should weigh about one pound each, and the hind ones twelve ounces. If four ounces are added to each shoe, let us see what a difference it will make. In plowing, cultivating, mowing reaping and many other farm operations, a horse will walk from ten to twenty miles a day, and advances about four feet at a step. At each step the horse lifts half a pound extra on its two feet, or six hundred and sixty-six pounds in every mile. In a day's work of fifteen miles the horse would lift nine thousand nine hundred pounds extra, or nearly five tons. If the force required to lift this five tons of iron could he expended in the work the horse is doing, much more could be accomplished. In the light of these facts, is it any wonder that when young horses hegln to wear shoes they soon become leg-weary, have their step shortened and acquire a slower walking gait?—American Agricuturist.

LIQUID FUEL.—Another engine fitted with liquid fuel has been running on the Great Eastern Railway, England—one of a class of ten similar express engines—and, as compared with the other nine engines doing the same round of duty, is reported as doing efficient service; that is, the oil-burner has consumed about one-third the weight of coal per mile, and about as much oil as coal in weight, her total fuel being thus about two-thirds by weight what it would be if all coal, and the liquid practically giving an efficiency of double its weight in coal. The engineer's account is interesting in relation to this engine when burning mixtures of plain gas, tar and creosote residua's, warmed up in the tank, which is placed in the rear of the tender, to a liquidity sufficient to cause it to flow freely through the injector-pipes, and to destroy its viscosity so that it would spray finely from the nozzles. Its behavior in the furnace he states to be satisfactory, filling the fire-box with white flame, the air rings also admitting of the most delicate adjustment of the supply of air for effecting combustion without air excess.—*Manufacturers' Gazette.*

Steamers of the World.

The new list of the merchant marine compiled by the Bureau Veritas, which is now in press, gives some interesting statistics concerning the great ocean steamship companies of the world.

Some people will be surprised to learn that the transatlantic lines are not the leading ones in aggregate tonnage or number of vessels. The British India of Glasgow and the British India Steam Navigation Company and the British India Associated Steamers, all one concern, head the list with 103 steamships. Their aggregate measurement is 293,635 tons.

Next stands the Peninsular and Oriental Steamship Company with 36 steamships, representing 216,887 tons. Next in order comes the Compagnie des Messageries Maritimes with 61 vessels, whose aggregate tonnage is 202,522. The fourth on the list is the Norddeutscher Lloyd of Bremen, some of whose vessels ply to this port. This company has 66 steamers, measuring in all 197,169 tons.

Other important lines are the Navigazione Generale Italiana, 106 steamers, 170,755 tons; the Compagnie Generale Transatlantique, 66 steamers, 167,487 tons; the Hamburg-American Packet Company, 56 steamers, 165 442 tons; the Wilson Line, 86 steamers, 158,089 tons; the Austrian Lloyd, 73 steamers, 128,359 tons; the Allan Line, 39 steamers, 123,038 tons; the Spanish Compania Transatlantica, 34 steamers, 94,163 tons; the White Star, 20 steamers, 95,370 tons, and the Cunard, 26 steamers, 85,913 tons.

STEEL FRAME BUILDINGS AND FIRES.—A Chicago building of the present style of steel frame construction has come safely through a severe fire test. The nine-story fireproof building of the Chicago Athletic Club caught fire Oct. 31st, and the fire was very hot, owing to the quantities of barrels and lumber in the lower floors, while the upper floors were in the hands of the carpenters and plumbers. The following is the published statement of an official of the insurance patrol: "As far as we can see, the building itself is all right. The big girders are not bent, the brick floors are not broken, and nothing has gone up but the slight brick partitions and the brick casing around the pillars. A few unimportant scantlings, that held the partitions in place, are bent and must be replaced. On the whole, the building is as sound as ever." The following remarks are credited to Mr. Charles Clark, the superintendent, who has represented Mr. Cobb, the architect, during the construction of the building: "I never knew a building to stand fire so well in my life. Of course the lumber and stuff inside burnt, and, everything being unfinished, there was nothing to prevent the fire rushing from the bottom to the top. As to the stone front falling to pieces, there is no stone which will stand fire and water combined."—Engineering News.

CLEAR, CONCISE STATEMENT IN DEMAND.—A professor informs us, says the *Baptist and Herald*, of Dallas, Texas, that science has now immediately before her three great prolems to tackle. The first is to produce electricity directly from coal; the second is to produce for illuminating purposes the "beautiful, soft beaming light of the firefly and the glowworm," which illuminates without heat; the third task is air navigation. With these undertakings inventors must wrestle victoriously before there is any remarkable improvement in mechanical science. That is all well. But there is one problem as mighty as any which it does not mention. That makes four for the coming man of science to solve. The fourth problem is to find a way to make professors of science and philosophy write plain, short, decent sentences, such as people can understand. The tremendous waste of gray matter, brain cells and "potential energy" involved in the attempt to make head and tail of scientific and philosophical writing as far exceeds the waste of fuel in producing steam as 10 exceeds 1. Take a sentence in this very magazine article. The reader begins it. He gets muddled and glances back to the beginning. It is so far off that he has a curiosity to count the words in it. There are 185; nearly half a page, and it wasn't a very very good day for sentences either.

SOLDERING ALUMINUM.—The property of aluminum which renders soldering so difficult is very probably its easy evidation. Although apparently resisting oxidation very strongly, yet if we take the word of those who have studied the subject closely, this resistance is not a simple process. It is believed that the instant a clean surface of aluminum is exposed to the atmosphere, it is instantly covered with a film of oxide, which, being continuous and unalterable, protects the metal beneath it from further oxidation. The film of oxide acts effectually to prevent any other metal from coming in close enough contact with the aluminum beneath to alloy with it, and thus soldering is prevented. The use of a flux to dissolve this oxide was tried under all conditions, but none have been found practicable. In casting about for a practical solution of this problem, Joseph Richards, of Philadelphia, reached the conclusion that the solder should contain its own flux, so that the instant the film of oxide was removed, the solder proper would be simultaneously present to take hold of the aluminum surface at the same instant that it was cleansed from oxide. Upon adding a percentage of phosphorus to the alloys heretofore used, far more satisfactory results were obtained. The nature of the work which could thus easily be performed with these solders led to the issuing to Mr. Richards of letters patent to the use of a deoxidizing agent, such as phosphorus, in solders, and on the strength of his experimental work, Mr. Richards now presents the claim that he has made a satisfactory solution of the problem of aluminum soldering.—Am. Manufacturer.

IN experiments on the influence of food and surroundings on the color of animals, Mr. E. B. Poulton reared caterpillars of the pepper moth under different conditions. Those confined among green leaves and twigs become green, those having black or brown twigs mingled with their food were brown or black, and others were turned light-colored by white pepper. With artificial colors, red and blue tended to produce a dark coloration, though, very strangely. painted twigs had not the same effect as those with the same natural tints.

THE year of greatest growth in boys is the 17th; in girls the 14th. While girls reach full height in their 15th year, they acquire full weight at the age of 20. Boys are stronger than girls from birth to the 11th year; then girls become physically superior until the 17th year, when the tables are again turned, and remain so. From November to April children grow very little and gain no weight; from April to July they gain in height but lose in weight, and from July to November they increase greatly in weight, but not in height.

PHOTOGRAPHY is now being made to record the movements of the growing parts of plants. Especially curious are the results with certain climbers, such as the hop convolvuls, isomoea, etc. The young stems move in a succession of irregular circular or eliptical curves, which vary every moment, even in direction, and are due to irregular growth in different parts of the stem. During the sleep of plants movements do not cease, but consist of alternate upward and downward vibrations.

IRON SLEEPERS.—In appears probable that Iron sleepers will in due time be used on an extensive scale in Austria. The State Railways Administration, it is reported, has contracted with the syndicated Austrian railmills for a large supply of metal sleepers at a price but slightly inferior to that paid for steel rails, with the proviso, however, that a lower rate is to be accepted should the demand exceed 25,000 tons. It is stated, moreover, that the Southern railway is inviting tenders for the supply of 35,000 iron sleepers.

THERE are 13 stars, 13 letters in the scroll held in the eagle's beak, 13 marginal feathers in each wing, 13 tail feathers, 13 parallel lines in the shield, 13 horizontal bars, 13 arrowheads in one foot and 13 letters in the words "quarter dollar."

NEW ENGLAND has $405,036,497 invested in textile industries; the Middle States, $205,436,578; Southern States, $62,558,729; Western States, $28,491,057.

RENDERING BOOTS AND SHOES WATERPROOF.

The same is a superior article for Preeerving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

Testing and Working Silver Ores

A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of ths work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ors is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat o furnace, want of sulpbur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

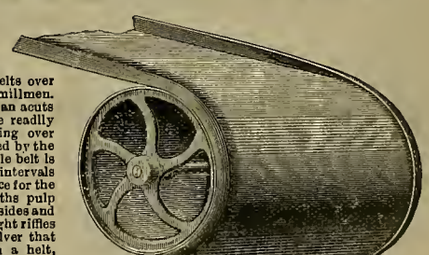
BEST CONCENTRATOR FOR ORES OF ALL KINDS.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

BAY STATE.—Amador *Record*, Nov. 19: The fine outlook at the Bay State mine is creating considerable stir in Plymouth district. Things bad been going wrong so long that people thereabont were pretty badly discouraged, but now they seem to be taking a turn for the better and everybody is talking quartz. There are a number of good ledges around Plymouth, and the people who own them are taking active measures to develop them. It would not be surprising if Plymouth became a livelier town than any of its neighbors in the near future.

PIONEER DISTRICT.—Amador *Ledger*, Nov. 14: This district is experiencing something of a boom in mining matters. The Pioneer mine, under its new owners, who are also connected with the Clinton Consolidated, is being developed with vigor. The work now in order is sinking. The shaft is going down on the ledge, and is at present 150 feet deep, and it is the intention to go at least 100 feet more, and from that depth to do considerable prospecting, with the view to ascertain the chances for permanency. The sinking so far has shown a ledge of fine-looking rock two or three feet wide. They are running with an air-compressor and machine drills, operated by a small engine. A large boiler, 25 feet long, arrived on the ground last week for the purpose of replacing the old one. There are from 15 to 20 men employed about the mine. The Modoc is also sinking, with fair prospects. The ledge is five feet wide. Gracey's roller mill is being fitted up to crush ore from Joe Leduc's claim, which is the south extension of the Modoc.

PINAVETTA.—This mine is situated one mile above West Point bridge, and is owned by Scott & Stirnaman. They are down 90 feet, with an ore-body of excellent pay rock two feet wide. Some of the rock has been shipped below for treatment.

AMADOR VIEW.—This mine is northeast of Pinevetta, and is owned by Messrs. James & Stirnaman. The shaft is 70 feet deep, and the vein runs from ten inches to two feet in width. It has been followed a distance of 90 feet, and holds its own in strength and quality. Several crushings have been made at the five-stamp mill on the property, which yielded an average of over $100 per ton. The mill is idle at present for want of water.

VOLUNTEER.—This property, which adjoins the Kennedy on the east, was lately bonded by A. P. Minear. Mr. Minear has made arrangements for the development of the claim, and operations were commenced this week. There is a shaft, about 150 feet, and this is to be repaired at once. The timbers are found to be utterly worthless, above water level, and will have to be replaced with new ones. Timbers for this purpose are being hauled, and the operations are to be pushed ahead as fast as possible. Mr. Minear is sanguine of opening up a paying mine here. It is not claimed that the Volunteer is on the line of the Kennedy ledge, but is a parallel vein. This, however, is no reason why it should not be a rich property.

MISCELLANEOUS.—J. T. Wheeler has commenced work on a deep gravel mine, about half a mile west of Pine Grove. The gravel is 50 or 60 feet from the surface, and can only be operated by drifting, on account of lack of water. It has not been worked for many years, although believed to be very rich.

Butte.

BANGOR.—Oroville *Register*, Nov. 19: The Morning Star Company has struck bedrock and is now drifting to reach the gravel channel. The bedrock is pitching to the north. The Grove Company is now down 150 feet and will have to sink the shaft about 50 feet farther before bedrock will be reached. The Turner Company sunk a shaft, but the water came in so rapidly that it could not be worked to advantage, and this was abandoned and a second shaft sunk 150 feet farther west. Bedrock has been reached in this, and the company is now drifting toward the east to tap the gravel beds. The Catskill, Bishop, and Hay & Clark mines are now taking out gold and getting good returns. Work is being pushed ahead in the Wheeler gravel mine on Wyman's ravine, and the shaft is now down 110 feet and drifts are being run in different directions to develop the channel. The paygravel is from three to four feet thick, and the bedrock is still pitching. There is no water to prevent work, and the machine will soon be completed and ready for operations. Mr. Wheeler says it will be about two weeks before they begin washing gravel. Wm. Conner, or "Wild Bill," as he is better known, found a silver lead in the hills last summer that promises to yield big returns when the lode is developed. He is going up in a short time to do some work on the ledge, for he had two assays made, and one of these showed the ore to contain $1863 and the other $2223 a ton. The company that was sinking the shaft upon the Mansfield mine near Wyandotte will shortly put in a power pump, and then run drifts from the bottom of the shaft to prospect the gravel.

ATTACHED.—Oroville *Mercury*, Nov. 18: Hay & Clark's mine at Bangor, the Blue and Gold, was attached yesterday by the Sheriff on an execution issued out by George Batts for $450. Of course this had the effect of closing down the mine and a number of men who have been employed there came to town to-day. In conversation with a *Mercury* reporter, one of them stated that the firm was considerably involved to laborers and other parties, probably to the extent of three or four thousand dollars. He says that the mine is rich, but the process employed in saving the gold does not work satisfactorily and the mine has been operated at a loss for some time. It is believed that by using a different process the mine would pay large dividends. Two of the miners employed, Ed. H. Riley and W. P. Jones, have filed liens against the property for wages due to the amount of $134 and $118 respectively.

Calaveras.

MILL STARTED.—Calaveras *Chronicle*, Nov. 19: The Herrold mine, formerly known as the "Leavitt," has got a five-foot Huntington mill running in good shape, and, as we are credibly informed, all indications point favorably to success. This mine has, in former years, paid large dividends to its owners for the surface workings, the rock extracted and packed to the Mokelumne river and worked by arrastre process yielding from $20 to $50 per ton. Capitalists have, for some unexplained reason, steered clear of this property until about one year ago E. J. Elzy, of Oakland, Cal., secured a bond and finally formed a company to purchase the mine for a mere song. Good management has prevailed, and to-day the developments show a tunnel 750 feet in length on the lead exposing a fissure filled with blue-ribbon quartz averaging 7½ feet in width. The mill has been running but five days, the plates of which are heavily coated with amalgam, which indications are far better than the anticipations of the owners. The usual activity is shown in and about the mine in the way of improvements. New houses are springing up, and in a short time the outside equipments will be all furnished. The principal owner of the property, Mr. Joseph Davis, of San Francisco, is at present at the mine and will arrange his business to spend a portion of his time at the property. At present he is having erected a residence and office.

TO START UP.—We learn that active operations are to be resumed at the Riverside mine at West Point, under the direction of San Francisco capitalists. The mine, which is said to be a good one, has been idle for over a year.

Inyo.

THE CYANIDE PROCESS.—Inyo *Independent*, Nov. 18: Frank Mathews arrived last Monday at Lone Pine from Eureka, Nevada. He is interested in the new cyanide process for the reduction of gold ores, and is connected with mines where it is in operation at Eureka and in Utah. Mr. Mathews is now arranging with J. Wilson to work ores in his mines in Coso district. The Hirsch mine, the mines in Hunter's canyon and other mines in Beveridge district will also be examined, with a view to work ores by the new process. Mr. Mathews left Independence yesterday with Mr. Wilson for Darwin, with intention to begin work as soon as possible. In different parts of the country there are gold ores in abundance that may pay good profit by the new process. Should the result prove successful it would be of much local benefit.

Mono.

THE BODIE CON.—Bodie *Miner*, Nov. 19: During the week east crosscut No. 1, 550-foot level, was extended 7 feet. Upraise from No. 2 north drift, 300-foot level, was extended 5 feet. North drift from above upraise was extended 9 feet. West crosscut, 200-foot level, was extended 7 feet. We are putting in a new pump-bob foundation at the 300 Lent shaft; the timbers of the old foundation are all rotten.

THE MONO.—During the past week south drift, 550-foot level, was extended 10 feet. West crosscut, same level, was extended 9 feet.

Nevada.

FINE GRAVEL STRUCK.—Nevada *Transcript*, Nov. 19: Rich gravel has been struck in the Odin drift gravel mine, situated on Selby hill, near this city. The strike was made in the upraise from the main tunnel that leads from the incline, at a point about 150 feet from the incline. Prospects made of three different carloads went at $1.50, $16 and $29 per car, which is exceedingly rich, and from the pitch of the ground it is thought that the channel will prove to be very large. The upraise already extended along the channel 100 feet, and the character of the gravel has improved steadily as work progressed. From all present indications, the Odin will be one of the best-paying mines in the county before long. There are now only 16 or 18 men employed, but as soon as the mine is opened, so that more men can be put to work, the force will be considerably increased. The new machinery at the hoisting works is working smoothly, and everything about the mine is being done in first-class manner under the efficient superintendence of Carl Hesse, C. E.

IMPROVEMENTS AT THE NORTH BANNER.—Grass Valley *Union*, Nov. 20: The North Banner Mining Co. has purchased an air-compressor and power drills, which are to be put in with the least delay possible. The reason for introducing this machinery is to expedite the work of crosscutting and drifting on the veins that are now being opened on. For months past the company has been engaged in crosscutting from the Banner vein into a series of veins that parallel it. One of these veins was cut at a distance of about 200 feet, and a pay shoot struck which gives good-milling quartz carrying free gold. The drift is being extended on this vein, which averages a foot in width. At the same time a crosscut has been run a distance of 60 feet for another vein in the series, and 100 feet more will have to be run before the vein is struck. Beyond this is another vein to which the crosscut will be extended. All of these veins have been prospected on the surface with good results, and at the depth at which they are now to be opened will furnish a large quantity of ore that will mill profitably. The country rock between the veins is hard, and because of this, and to expedite the work, the compressor and power drills are being introduced. The compressor is to be set up in the adit level of the mine at the head of the incline shaft, and will be operated by waterpower. At the present time all the work on the mine is carried on at a level with the tunnel, and no hoisting or pumping has to be done. The present plans of the company contemplate a very extensive development of the several veins belonging to the system, and which will give a large output of ore at a moderate cost when the crosscut is completed and the different veins opened upon. At the present time the ground is not opened sufficiently to furnish ore to keep the mill going constantly, but the clean-ups that are made are very satisfactory.

Plumas.

A RICH MINE.—*National-Bulletin*, Nov. 19: From R. L. McGill, one of the owners of the McGill & Standart Consolidated quartz mine, who was in town Wednesday, we gleaned some interesting news concerning that important mining property, which is situated west of Greenville, near the head of North canyon and a short distance below the Round Valley reservoir, the property of Messrs. Bidwell & McGill. The mining property consists of five locations, all patented. Connected with it is a tract of timber land comprising 640 acres. The work of extracting ore from tunnel No. 2 has been progressing all the past summer. The quartz is hauled to the Kettle mill, a distance of one-half mile, at a cost of 30 cents per ton. The ore is mined very cheaply, only three men having been employed in breaking sufficient ore to keep the 20-stamp mill running, and it crushes 30 tons per day. The average yield has been $6 per ton. Tunnel No. 2 is in 1500 feet, and about half-way across the Pacific location. Good ore is in the face of this tunnel, and Mr. McGill says there is a three years' supply in sight in this tunnel alone. During the progress of work in tunnel No. 2, a lower tunnel, No. 3, nearer the bed of North canyon, has been pushed forward, and is now into the mountain 800 feet. A chimney 80 feet long, and containing $20 ore, has been run through. Owing to the steepness of the mountain, the ore from this tunnel cannot be hauled to the Kettle mill; hence, as early as possible next spring, Messrs. McGill and Standart will erect below the mouth of tunnel No. 3 a 20-stamp mill. By so doing they will have command of a body of rich ore which should last for years.

JAMISON.—From Sam. W. Cheney, Supt. of the Jamison mine, we learn that active work, except contract work, will not be prosecuted in that mine during the winter months, but will be resumed next spring.

Shasta.

MINING NOTES.—Redding *Free Press*, Nov. 19: On Thursday of this week Charley Bailey and H. M. Perham hauled a couple of loads of machinery to the Flat Creek mines. Mr. Simoni, owner of the Gem mine in the Lower Springs district, is pushing ahead an 800-foot tunnel from the Middle creek side to tap his ledge at great depth. The Iron Mountain Mining Company shipped this week by Wells, Fargo & Co. 13 silver bricks or 2145 ounces. It is scarcely a month since the last shipment was made. The Crown Point Co. is preparing to put in concentrating works at the company's mines on Mule mountain. A force of men is driving ahead on the tunnels and general activity is reported. The Connor group of mines on Salt creek have been bonded to Mr. Miryansky for $15,000, the money to be paid in installments. Mr. Miryansky has two shifts of men working day and night. Captain Clark of the Gladstone Company put 60 miners to work this week taking out ore and prosecuting tunnel work, and the mill is running night and day. The shut-down last week, it appears, was only temporary. Connor & Son are opening up the Phœnix location, a short distance from their former operations on Salt creek. In a depth of 12 feet they have run on to a strong ledge of quartz, rich in coarse gold and easy to work. It is claimed that since the Sierra Buttes Mining Company purchased the Uncle Sam mine a net profit of $148,000 has accrued to the stockholders. This speaks well for Shasta county mines and for the able management of the company. Peter Scherer has succeeded in disposing of a large block of mining stock of the Eureka tellurium, and will erect a 10-stamp mill, put in concentrators and proceed to work the ore. In fact, grading for the mill has been completed, and he has built a tramway to the mine. Colonel Lyons returned from St. Louis Thursday morning. He was accompanied by his family. He informed us that while in St. Louis he organized the Rich Gulch Gold Mining Company; place of works, Old Diggings, Shasta county. The capital is $1,000,000; number of shares, 100,000, at $10 per share. The company was organized under the laws of Illinois. The first work to be done by the new company is the running of the tunnel from the west side of the mountain, which will open up the mine at a great depth and tap all cross ledges. Upon opening up a good body of ore the company will erect a mill and put in the necessary machinery required to work the ore. Mention was made last week of the discovery of ore highly charged with sulphurets in the bottom of the old Spanish shaft of the Reid Mines Consolidated Company. Colonel Stevenson, the superintendent, being anxious to know the value of the ore, had the samples tested by two reliable assayers in San Francisco, and the returns far exceeded his most sanguine expectations. One sample went $552 in gold and 11 ounces in silver; the other, $603 in gold and 29 ounces in silver. The ledge, which started in at 18 inches wide, has increased to two feet, the shaft being down about 70 feet, or 20 feet below where the ledge came in. It is the intention of the company to sink this shaft 500 feet and then crosscut their six ledges for 1000 feet, which will give them 1100 feet of ore backs. The company has $55,000 of treasury stock, the proceeds from the sale of which will be used in developing the mines. The rich ore discovered makes Colonel Stevenson feel quite elated, as he will be able to ship the ore at good profit and thus pay a dividend on the stock sold.

Sonoma.

HEALDSBURG PAINT MINE.—Sonoma *Tribune*, Nov. 19: The directors of the company a few days ago effected a lease of ten years with James E Fowler of Oakland, by which the latter binds himself to pay a stipulated royalty for each ton of ore taken from the mine, with the option of purchasing the mine at any time during the year, also to pay a stated amount each month, whether ore is extracted or not. All the stockholders signed this lease and the same is on file in the Recorder's office at Santa Rosa. On Thursday last men and mining tools came up from Bodega and work was commenced. It will be remembered an assessment was levied in 1891 and the amount was expended in driving a tunnel into the ore deposit. This was run 93 feet in the ore bed and some fine ore extracted. Mr. Fowler, hearing of the mine, visited it, was favorably impressed and leased the same, as stated above. A tunnel has been started farther down the hill, so as to strike the ore at a greater depth than the one run last year. The work of developing the mine will be prosecuted during the winter. Three hundred feet from where the tunnel has been started the ore bed shows on the surface a width of 96 feet. Reduction works will be erected either in Healdsburg or in the vicinity of the mine.

NEVADA.

Washoe District.

CONE. CALIFORNIA AND VIRGINIA.—*Chronicle*, Nov. 19: There has been extracted from all parts of the mine during the week 967 820-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $26.32 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $23.02 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $16,460.85.

OPHIR.—1465 level—We have continued to work north from the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, and have extracted therefrom and raised to the surface 53 tons of ore, the average assay value of which is $27.30 per ton. At one point in our working in this locality we have stoped out upward to the height of 12 feet above the sill floor, and there the ore deposit seemed to give out and changed into a porphyry formation.

MAXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 18 feet; total length, 303 feet; continuing in a porphyry formation with lines of low-grade quartz.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift, has been extended during the week 24 feet; total length west from the joint shaft, 2637 feet. The face is in porphyry.

UTAH.—340 level—The north drift from west crosscut No. 2 has been extended 20 feet; total length, 186 feet, continuing in vein porphyry, clay and stringers of quartz.

SIERRA NEVADA.—Are stoping north in the Cedar Hill drift. Some fair-grade ore has been found. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 24 feet, making the total distance west of shaft, 2637 feet; the face is in porphyry.

ANDES.—North drift from east crosscut No. 1 north, on 420 level, advanced 15 feet; total, 47 feet; formation, soft porphyry.

BEST & BELCHER.—West crosscut No. 2 has been advanced 16 feet; total length, 76 feet; formation passed through was soft porphyry and stringers of quartz.

GOULD & CURRY.—West crosscut No. 5, 432 feet from main west drift, has been advanced 17 feet; total length, 103 feet. Have also repaired north drift, from west crosscut No. 3, 30 feet during the week. On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 15 feet; total length, 685 feet; face in hard porphyry.

HALE & NORCROSS.—We continue retimbering main shaft at the 800 level. During the week the west drift on the 150 level of the old or A-street workings was extended 17 feet, making its total length 72 feet.

POTOSI.—The raise from No. 1 crosscut, 1100 level, is up 65 feet; the ore in the top is four feet wide, the average ore samples of which assay $40. The east crosscut, 50 feet south of the Potosi winze, 1150 level, continues in porphyry. During the week we have been occupied in repairing the Ward shaft and in laying a pump column along the northwest drift from the Ward shaft, 1800 level to the Potosi winze, preparatory to pumping the water from the shaft through the winze to the 1500 level, and thence taking it to the Sutro tunnel. This water has heretofore been tanked to the surface at great expense. Extracted and sent to the mill the past week 417 tons of ore from the 550, 930 and 1500 levels. Milled during the week 400 tons. On hand at mill, 76 tons, 900 pounds. Average battery assay, $28.29. Shipped to the Carson Mint, 372½ pounds of crude bullion.

CHOLLAR.—We are repairing upraise from 350 to 250 level, also the main shaft from the 930 to the 850 level. The east crosscut, 160 feet south of north line, 930 level, is out 27 feet; face in porphyry and clay.

BULLION.—The west crosscut from north drift, from top of raise from east crosscut, 320 feet south of north line, 1300 level, is out 19 feet; face in porphyry and quartz that gives low assays.

ALPHA.—The past week has been occupied in repairing the Ward shaft and in laying a pump column along the northwest drift from the Ward shaft, 1800 level, to the Potosi winze, preparatory to pumping the water from the shaft through the Potosi winze to the 1500

level, and thence to the Sntro tunnel. This water has heretofore been tanked to the enrface at considerable expense.

EXCHEQUER.—The paet week hae heen occnpied in repairing the Ward ehaft and in laying a pump column along the northwest drift from Ward ehaft, 1800 level, to the Potosi winze, preparatory to pnmping tbe water from the shaft throngh the Potosi winze to the 1500 level and thence to the Sntro tnnnel.

WARN SHAFT.—The past week has been occnpied in repairing the Ward shaft and in laying a pnmp column along the northwest drift from the Ward ehaft.

OCCIDENTAL.—We have discontinued the milling of ore for the season and bave closed the mill. Have resumed work in the sontb drift on tbe 750 level and are driving the main nortb drift on tbe same level through low-grade quartz. Have started No. 2 in the Zadig drift, Sutro tunnel level, at a point near the end of the drift.

NEW YORK.—The winze on the 650 level is down 73 feet on the slope; bottom in low-grade quarlz. Are taking out 10 cars of ore per day, car samples assaying from $35 to $40 per ton. The west crosscut, 50 feet north of ebaft, 800 level. is ont 21 feet; face is in clay and porpbyry.

SILVER HILL.—We are repairing tbe northweet drift, 260 level. Shipped to Carson Mint in paet week, 170⅜ pounds of crude bullion.

ARIZONA.

PROFITABLE RUN.—Arizona *Gazette*, Nov. 19: The latest rnn of the Bonanza mill at Harqua Hala, in 25 days brought to Hubbard & Bowers a neat $55,000 brick—not a bad showing for such an economically-conducted property.

A BIG STRIKE.—Tombstone *Epitaph*, Nov. 19: A. Baner came in last night from his mines in the Golden Rnle district. He bronght with him a few pounds of rock from a new find he made upon the gronnd of one of his claims. He fonnd a few small pieces of float a few days ago, and as it looked well be followed it up and found a ledge six feet wide of lead ore which is pronounced by those who have seen it as being one of the biggest proepects in the county. Assays made give a result of 84 oz. silver and 41 per cent lead per ton. There is said to be a thonsand tons in sight and the ore is being eacked and piled up for shipment.

BRITISH COLUMBIA.

BEOAME RICH BY ACCIDENT.—Seattle *Post-Intelligencer*, Nov. 11: J. H. Moran is at the Rainier, having jnst retnrned from the Slocan mining district with a nnmber of rich specimens of lead ore from that region. Last June he went up to that country a veritable tenderfoot, never having seen a mine, on a prospecting tour. The second day after his party had located a camp and gone to hunting for eigns of ore, he lost his companions, and being somewhat fearful of bears, of wbich there are plenty in that region, he thougnt it best not to go farther from camp, and sat down to wait for his partners to return. While waiting for them he picked up a small boulder in mere idleness. He was strnck with its great weight, and broke it in two, when he saw that it was nearly pnre galena. He picked np others, and a short distance np tbe hill he found the ledge whence the float had come. And thns he became rich. His ore averages $130 per ton; it cost during the snmmer to ship it by packing on caynses, boat, railway hanl, treatment and import dnties abont $100 per ton. "During the winter, however, thie expense will be greatly lessened," said be, "by dispensing with the pack animale and hauling the ore to the boat on Arrow lake by sleds. About a score of claims will be worked all winter. I have come down for the pnrpoee of laying in a winter's stock of snpplies, and ehall retnrn again in a few days. I am not sorry that the Democrats have carried tbe day in the elections this year, because if they take off the duty on lead ores it will make onr ore worth about $30 a ton more to us, and will give a greater impetns to American mining in British Columbia."

IDAHO.

CLEAN-UP.—Silver City *Avalanche*, Nov. 16: The new Trade Dollar mill is a "dandy." Tbe resnlt of a ten daye' rnn from a partial clean-up amounts to fully $30,000, and a saving of from 95 to 95½ per cent of the valne is made. The concentrates have a value of over $5000 per ton. Four 4-horse teams are engaged in hanling ore from the mine. The first month's run of the new mill will amount to $100,000. The Blaine tunnel has at last ent the Trade Dollar ledge at a distance of nearly 1900 feet from the mouth of the tunnel. The ledge ie of good widtb and shows the same cbaracter of quartz as fonnd in the upper workinge. No assays have yet been made. Tbe ore-body is over a foot wide in the face. The stope on the Blaine ledge is looking well, considerable rock being sacked for ehipment and also hanled to the mill for reduction.

BLACK JACK.—The Black Jack mill started np on the 1st inet., and is running eteadily. Concentrators have been added to the plant, and a large percentage is now saved. Wm. Davis hae been doing some work on a property of his located in Whieky gnlch. Abner Enoch is in from South mountain and reports everything looking favorable. He bas bad an assay made from his Carbonate claim, which resulted $107 in silver. The ledge is four feet in width. The property is developed by an 80-foot shaft and a 25-foot tnnnel running from the shaft at a depth of 40 feet.

OREGON.

THE QUARTZ-MILL RUNNING.— Ashland *Tidings*, Nov. 18: The new quartz-mill of the Ashland Mining Co., at the old planing-mill on Mechanic street, was started Tuesday and everything fonnd to work to a nicety. Wednesday the mill commenced running regularly, crushing qnartz, and its buey hnm is pleasant mueic to the people of Ashland now.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Nov. 23, 1892.

General trade the past week under review was quiet in all lines except those peculiarly adapted for the holiday trade. It is quite generally claimed that this season's holiday purchases will be lighter than they were last year. This opinion is grounded on the prevailing idea that the public is still economizing, and therefore smaller expenditures can be looked for during midwinter. Farm produce has been receiving only a fair degree of attention. This is largely due to the year drawing to a close and also to restricted supplies and no strong selling pressure. Dry weather up to to-day has had an unfavorable effect on all branches of trade, but if the rains to-day continue and also become general, the feeling of uncertainty and uneasiness regarding a dry winter will be dispelled.

The local money market does not present any changes deserving particular mention. The feeling of uncertainty still predominates, although there are indications of a gradually growing feeling of confidence. There appears to be a mistrust regarding congressional legislation, and until the 52d Congress is a thing of the past, and an extra session talk is decided as ill-advised, it is hardly likely that the feeling will be allayed. There is a very general feeling that if an extra session of Congress should be called, more or less hasty legislation would follow which would probably tend to the further cnmplication of both business and financial affairs; but if affairs should be allowed to run along as they now are until the regular session of 1893-94, then the general situation would have adjusted itself to the expected changes. It is said that there is still a steady increase to the bank reserve, with no corresponding inclination to put out funds until after the turn of the year. It is quite generally conceded that the disbursements in January, 1893, will aggregate larger than did those in January of this year. What this opinion is grounded on, it is hard to say, for, as a rule, the earnings of large incorporated companies do not show much, if any, increase this year over the earnings in 189r.

Eastern mail advices report a continued activity in trade circles witb manufacturers, as a rule running on fuller time. This seems to apply to nearly al branches of manufacturing enterprises. The advices also confirm telegraphic information of an advance by several manufacturers in the wages of employes. The advance, it is said, was not generally looked for, and therefore greatly surprised commercial and financial writers. The higher wages paid by the balf dozen or more manufacturing companies, it is tbougbt, will be followed, after the turn of the year, by others. It can be only a question of a short time before this change for the better will make itself more generally and beneficially felt. New York advices report that money had a firmer tendency. Time loans were in abundant supply, but rates were firmer at 5 per cent for thirty days, 5½ for sixty days and 6 for longer dates. Commercial paper was in better demand, more of the New York banks being in the market. The imports of merchandise at New York for October amounted to nearly $50,000,000 exclusive of specie, whicb is nearly $7,000,000 in excess of the corresponding month of last year, and were larger than for the same month of any previous year wit the single exception of 1890. Exports decreased in a still larger proportion, the shipments of produce and merchandise having been only $31,000,000, against $37,000,000 for the same montb of last year. The first four months of the fiscal year have, on comparison witb the corresponding period last year, gained $22,957,204 in imports of merchandise, but have lost $22,538,521 in exports. From present prospects when the returns from all tbe ports are in the ten months' statement will be less favorable than last year, wben the balance of trade was over $100,000,000 in favor of this country.

The International Monetary Conference commenced its sitting yesterday, November 22, at Brussels. It is quite generally conceded that the discussions pro and con on metallic currency will take on an enlarged form, which will probably some time in the near future, lead up to a general international monetary agreement. While this is the generally expressed opinion regarding the outcome of the conference, yet there are many of the ablest financial writers who contend that before this desideratum is attained a severe lesson will have to be taught the gold-using countries, and this lesson will be in the shape of a financial panic which will rock to their very center England's commercial and financial standing. This portion of the writer's opinion appears to have been taken after a careful survey of the situation abroad, and the well-established fact that the outstanding paper obligations of each country in Europe largely exceeds the metallic reserve that can be used for redemption purposes. Be the above as it may, yet it must be conceded that the proceedings of the Conference will throw much light on the situation, and therefore be closely watched by all interests.

SILVER—The market has held around quotations which have ruled during the past two weeks. The action of the market at home and abroad indicates that operators are waiting the general decision of the International Monetary Conference. While the consensus of opinion is that the majority of the delegates to the Conference will throw their influence toward an international agreement to ennoble silver, yet from the fact that the action of the Conference will not be binding on any country represented, the conclusions arrived at will lose much of their importance, and any benefits derived from a favorable action will be lost in the near future. If this shall prove to be the case, then any person or persons acting on the action of the Conference will hazard considerable, for until bimetallism is adopted by leading countries, the market value of silver will continue to be controlled by speculators. The free coinage of silver, confining it to the product of this country, it is now stated will come up in the 52d Congress, and probably be acted on before the close of January, 1892.

MEXICAN DOLLARS—The market has held steady at arnund 67¼ cts.

QUICKSILVER—Receipts the past week aggregate 295 flasks. The market has been fairly steady. It is said that there has been some quiet buying lately, whether for speculative purposes or for more general use owing to the favorable outlook for hydraulic mining.

BORAX—Receipts the past week aggregate 733 ctls. The market is steady, with continued free shipments overland.

LIME—Receipts aggregate the past week 2207 bbls. The market is steady at from $1.25 to $1.50 per bbl.

ANTIMONY—The market is slow at unchanged quotatinns, both in this and the New York market.

PIG LEAD—The market is fairly steady. From first hands in round parcels the market is quoted at $3.85; jobbing at quotations.

PIG IRON—The market is essentially unchanged. The stock on band is going gradually into consumption. Eastern mail advices report a quiet but steady market. Imports the past week aggregate 250 tons from Newcastle, England.

TIN—It is said that some quiet feeling is going on for later delivery of both pig and plate. English advices report plate-makers firmer in their views, with a disposition to advance prices. Eastern advices repnrt an inactive market, with buyers and sellers apart.

COPPER—The market shows more firmness, with an upward tendency. A London cable to *Iron Age*, Nov. 17, says: "Prices for merchant bar copper have advanced about £1 during the week, and the impression is stronger that producers identified with the movement to restrict production are gradually gaining the upper hand. There has been more active buying for India, and that, along with liberal purchases on American account, has helped the upward movement in prices. Additional stimulus has been imparted by the reports that the reduction of American output is assured, and a further report that American operators have purchased freely here since the rumored stoppage of the Montana works also carries some weight. Reduction of output in the latter quarter, it is argued, will hamper English smelters, and bids on furnace material, as well as on bars, have been somewhat higher. There has been a lively demand for furnace material. Consumers' stocks are light and supplies elsewhere appear to be very moderate. Decidedly higher prices are asked for future deliveries. The European visible supplies of copper have decreased 1722 tons during the past fortnight, and a falling off of 1422 tons in spot stocks is also recorded.

COAL—Imports the past week aggregate as follows: Seattle 2433 tons, Coal Bay 10, Tacoma 4700, Swansea 2600, Nanaimo 3677, Coos Bay 800; total, 14,221 tons. The market bas held to firm prices throughout the week for both steam and household. The demand for the latter bas enlarged. Foreign coals, it is said, show an advancing tendency.

Copper is strong with an advancing tendency. Lead is steady. Tin continues under manipulation influences. Pig iron is firm. Quicksilver is steady. Borax is in fair demand at unchanged quotations.

Mining Share Market.

SAN FRANCISCO, Nov. 23, 1892.

During the past six days mining shares have fluctuated downward. The decline has not been large, yet the weak and dragging character of the setback, backed as it was by strong bear points and strong bear press writing, created considerable and uncalled for demoralization. The wonder is, that under such a strong pressure the market did not go to pieces; that it did not must be accepted as proof positive that the inside has most too many of some of the shares for comfort and that the manipulators are not prepared to commit financial suicide by frightening the game to such an extent as to interfere, when the time arrives, with an attempt to unload at a fairly good profit. Whether the inside can succeed as well as they hope remains to be seen. The past few upmoves did not turn out as profitable to the manipulators as they, seemingly, had been led to expect, for when the market made a good advance more shares came in than they had evidently looked for, and as it took a good round sum of money to handle the shares of fully 20 mines, representing over 2,000,000 shares, the manipulators were forced to make a rapid retreat. The breaks in the market, unfortunately, carried in their wake the more credulous bull operators. While saying this, it must not be understood that the writer joins with those in decrying the mines and whose stock in trade is chiefly the cry of "if only a genuine development of ore can be made, then we will have a big boom in mining shares." The difficulty, and perhaps the only one, is that under the present system of milling ore on the Comstock, by which it is said mill rings get the bullion and the public the assessments, the money public cannot be induced to take part in the game, and until the latter operates we need not expect anything more than small boomlets, one of which all indications warrant the assertion that we are on the eve of having started, and that, while prices will go higher than now rule, operators must not look for anything big until the mines are managed and the ore milled so as to inspire confidence to invite moneyed outsiders to deal. At this writing the coming up move looks as if it will be another attempt to unload for assessment purposes.

The present showing in Belcher, if made at the time when the public had more confidence in mine-managers, would have caused high prices to obtain for the shares, which would have carried the entire line to a much higher plane of values. The present showing in that mine ought, on merit alone, cause the shares to sell for from $5 to $10 per share, and if present prospecting work results as favorable as experienced miners confidently expect, then the shares, on merit alone, would, if the mine was or is to be bonestly managed, sell for even more than $10 a share. This assertion is based on seemingly authentic information that the ore found on the 300-foot level, and which was followed for some distance, is from eight to twelve feet wide and averages over $40 a ton—some say over $50 a ton. If the west crosscut on the 400-foot level strikes the downward continuation of the ore, then the company has a large body of good-milling ore, which can be extracted at a small cost and dividends follow. But will it be done?

Mining shares opened this (Wednesday) morning moderately active at around the prices at which the market closed yesterday afternoon. After regular call, Belcher sold higher under a slightly improved demand, owing to advices that the ore pulped over $32 per ton. This high average, which was not generally looked for, should dispel the false reports of an assessment pending. The action of the market looks very much as if shares were selling at around bottom prices and that an advance along the line can be confidently looked for in the near future. Some of the more shrewd, conservative and heretofore successful operators look for one or more slight ups and downs, with, possibly, slightly lower prices before the market starts in on the coming boomlet; but that the latter is coming they affirm with unhesitating confidence, and this confidence appears to be well-grounded, for the public, it is said, has been squeezed out of every share possible, and when this fact is established beyond the cavil of a doubt, then the change for the better will set in.

Potosi ore the past week pulped $28.29, while the car sample assays went only $28.10 per ton. This is as it should be, and looks very much as if the managers of that mine were looking after the interest of *all* shareholders. It is to be hoped that the managers of other mines will follow in the footsteps of the Potosi managers, and see that the ore is properly milled and accounted for.

By those in position to know, it is said that the manipulators of the share market are not doing anything openly, but quietly have their brokers take in every share offered for sale, and not take any chances to lose any shares bought. Everything points to an upmove snon.

The shares in the Bodie mines, it is contended, are selling below their actual worth, which will be discovered before another year passes. In two or more of the mines, it is said by experienced miners, deposits of very rich ore are known to exist, and that the depression in these shares is probably due to this fact and a desire of the inside to buy all they possibly can and at as low a figure as possible.

From the Comstock mines our advices are of a very encouraging character. Along the entire line it looks as if important work is being done with the view to make a more general move from one end to the other. It is said that when work is too far advanced in one section dead work is done so as to let the more backward work elsewhere catch up. Work in the secret drift mentioned about three weeks ago is being vigorously pushed. The nature and character of the work is said to be known to a limited few. It is contended that in Hale & Norcross important work is held back until the word is received from John W. Mackey, through J. L. Flood. When this work is started, then more active work is to be commenced at interesting points in three other mines. In the Sierra Nevada-Union west crosscut they are nearing the west lode at about an equal distance between the old Burning Moscow and Sacramento. The west crosscut on the 1300-foot level of Seg. Belcher, unless stopped, bids fair to be one of the most important works under way. The news from New York and Silver Hill is

quite important, but owing to the low price of the shares, it is not attracting attention. The draining of the Ward shaft level of Alpha, Exchequer and adjoining mines through Potosi into the Sutro tunnel, is quite an important move. Who knows but the next move may not be reporting the rich ore found to the west on this level? In Yellow Jacket and Crown Point the work, it is said, will soon be quite important. In Ophir, it looks as if they are developing a kidney of rich ore. The changes in the character of the ore have been for the better. In Con. Virginia they expect to soon commence more active and important work.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco

NEWHALL HYDRAULIC MINING COMPANY (Los Angeles). Capital stock, $250,000. Directors—Edgar Moore, J. E. Lane, B. A. Holmes, J. A. Forthman and O. C. Smith.

EXCELSIOR CREAMERY CO. (Eel River Island, Humboldt Co.) Capital stock, $15,000. Directors — Smith Fulmor, Con. O'Mara, Silva Counsto, W. P. Thomas and C. F. Bunker.

PACIFIC MARINE RAILWAY AND WAYS Co. of San Francisco. Capital stock, $50,000, divided into 500 shares of the par value of $10 each. Directors—Alexander Hay, E. B. Wright, E. P. Schell, B. H. Madison, James Tayson and M. J. Madison.

THE OAKOLE MINING AND MILLING Co. Capital stock, $1,000,000. Directors—John W. Richards, Ed. H. Congdon, J. H. Congdon, Samuel W. Backus and Edward Kimball.

ALASKA FISHING AND TRADING Co Capital stock, $50,000. Directors—L. A. Rickoff, S. L. Weatherbee, S. W. Wetherbee, H. W. Snow and A. A. Hibbard.

EMME GROUND ELECTAIC GENERATOR Co. Capital stock, $1,000,000. Directors — Michael Emme, Geo. W. Peterson, Chas. P. Harris, Alphcus Bull and H. D. Hawks.

STOCKTON ELECTRIC LIGHT AND POWER Co. (Stockton). Capital stock, $250,000. Directors—H. J. Corcoran, E. R. Hedges, I. S. Bostwick, Joseph Fyfe and S. D. Woods.

PALO ALTO MUTUAL BUILDING AND LOAN ASSOCIATION (Palo Alto, Santa Clara Co.) Capital stock, $2,000,000. Directors—W. W. Sheldon, G. W. Mosher, W. E. Noris, D. L. Sloan, D. E. Ashby, H. G. Wilson, J. F. Parkinson, J. N. Morton and A. J. Harper.

PALOS GRANDE COAL AND TEANSPORTATION Co. Capital stock, $2,500,000. Directors—J. M. Martin, J. W. Pearson, L. M. King, G. E. Neale and J. F. Uhlhorn.

HAYES FISHING Co. Capital stock, $25,000. Directors—George Fogel, A. Rowes, D. E. Hayes, S. E. Weeks and J. J. Staiger.

PEERLESS POLISH COMPANY (Los Angeles). Capital stock, $100,000. Directors—C. S. Watson, W. E. Tyler, L. E. Tyler, M. S. Tyler and L. A. Watson.

FOGEL FISHING COMPANY. Capital stock, $25,000. Directors—George Fogel, Albert Rowe, D. E. Hayes, S. F. Weeks and John J. Steiger.

ROWE FISHING COMPANY (San Francisco). Capital stock, $25,000. Directors — Same as above.

STAIGEE FISHING COMPANY (San Francisco). Capital stock, $25,000. Directors — Same as above.

EL CAJON FRUIT COMPANY (El Cajon, San Diego county). Capital stock, $5000. Directors—George H. Holt, J. T. Gordon, R. C. Allen, G. M. Hawley, E. S. Vacher, S. J. Day and A. W. Gilbert.

FLAT CREEK MINING COMPANY. Capital stock, $400,000. Directors—Martin Jones, John Henderson, F. C. Mosebach. S. Gardner, T. E. Jewell and Sylvester Gardner.

BRISTOL MINING COMPANY (San Francisco). Capital stock, $400,000. Directors—Same as above.

BALAKLALA MINING COMPANY (San Francisco). Capital stock, $600,000. Directors—Same as above.

COSMOS GOLD-MINING COMPANY. Capital stock, $400,000. Directors—Same as above.

SOUTH IDAHO CONSOLIDATED MINING AND MILLING COMPANY (Glass Valley, Nevada county). Capital Stock, $160,000. Directors—W. J. Rogers, James McCerma, Joseph O'Keefe, W. H. Crase and J. J. Greany.

DR. WEEKS MEDICINE COMPANY (Oakdale, Stanislaus county). Capital stock, $25,000. Directors—E. L. Barkis, O. D. Weeks, C. H. Trelfal, Wm. P. Gsmble and A. F. Donaldson.

MONADNOCK GRAVEL-MINING COMPANY, limited (Marysville, Yuba county). Capital stock, $10,000. Directors—L. C. Williams, Wm. B. Bishop, Wm. F. Peacock, J. A. Maber and F. E. Smith.

COTTONWOOD CANYON WATER COMPANY (Pasadena, Los Angeles county). Capital stock, $30,000. Directors—W. S. Wrigbt, W. R. Staats, John McDonald, C. E. Brooks, Joseph M. Campbell.

THE W. A. DAVIS Co. (Brentwood, Contra Costa county). Capital stock, $100,000. Directors—William A. Davis, R. G. Dean, H. O. McCabe, J. R. Esker, P. G. King.

GREEN'S ART COMPANY. Capital stock, $10,000. Directors—Carl Cohn, S. Goldsmith, William Carter, Leo Green, E. W. Levy.

CALIFORNIA INVESTMENT COMPANY (Los Angeles). Capital stock, $125,000. Directors—George H. Bonebrake, F. C. Howes, W. Gillelen, W. S. McDonald, W. M. Sheldon.

LOS ANGELES THEATRICAL MECHANICS' ASSOCIATION. Directors—Henry Decker, L. E. Martin, J. D. Cochran, W. T. Waters, D. A. Stinert, B. Caspari, A. J. Snee, G. G. Hargnitt, James Taylor, Henry Stevens, J. R. Hilton.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 15, 1892.

486,076.—HOSE-SUPPORTER—Ellen A. Black Beckwith, Cal.

486,245. — WAGON-BRAKE — F. W. Dobbel, Purissima, Cal.

486,328.—RAILWAY SPIKE—S. Emrich, Redo, Nevada.

486,169.—CLAMP FOR STEREOTYPE PLATES—Wm. Filmer, S. F.

486 331.—GUN SWAB—G. H. Garrison, Sumas City, Wash.

486,250.—CASH CARRIER—A. B. Gunzendorfer, Monterey, Cal.

486,405 —DOUBLE PIANO STOOL—J. J. Hering, Seattle, Wash.

486,292.—LUBRICATOR—J. W. McCorkle, Lexington. Wasb.

486,232.—ORE CONCENTRATOR—P. de Napolis, S. F.

486,238.—SAFETY HARNESS—J. T. Smith, Oroville, Cal.

486,137.—TRAY FOR DRYING FRUIT—H. H. Taylor, Fresno, Cal.

The following brief list by telegraph, for Nov. 22, will appear more complete on receipt of mail advices:

California—Albert D. Coplin, Oakland, hose reel; Ferdinand Espel, San Francisco, measuring canister; William R. Hewitt, San Francisco, electric-releasing device; Andrew J. and J. James, Santa Cruz, lazy-tongs gate; Charles W. Metcalf, Santa Paula, centrifugal honey extractor; Roswell E. Morey, Oakland, machine for forming berry baskets; Edwin M. Ree e, Santa Paula, wooden vessel; James Tulloch. Los Angeles, concentrator; William A. Turner, San Francisco, street or station indicator.

Oregon—William S. Dillon, Portland, automatic station indicator; James Ecker, Portland, furnace.

Washington—John Globig, Spokane, car-coupling; John F. F. Kuhlmann, Seattle, railway system.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AXLE-NUT.—John Gambetta of Stockton, Cal. No. 485,497. Dated Nov. 1, 1892. This nut, which is intended for use on the threaded ends of the axle-spindles, to hold the wheels on, is so constructed interiorly that it can be adjusted to take up the wear in the hub-box and thus keep the wheel snug. It also securely confines the nut-washer, preventing it from falling ont when the nut is removed. The nut is provided with a lock, easily manipulated from the outside, which will hold it in place on the spindle at any point to which it may be set.

APPARATUS FOR BLEACHING FRUIT. — Elias Ireland, Winters, Yolo Co. No. 485,940. Dated Nov. 8, 1892. The object of the invention is to provide an apparatus for bleaching fruit, in the bleaching chamber of which an entire car or truckload may be introduced with readiness and deposited therein while the car or truck is removed, being adapted when returned to the chamber to receive the load again and withdraw it. The invention consists in a novel apparatus, composed of a chamber or casing to which the fumes of the sulphur have access, a vertically-movable track within said chamber and upon and by which a load-carrying truck is introduced therein, a removable load-platform carried by the truck, supports within the chamber upon which the platform is borne when relieved of the truck by the downward movement of the track, and a novel arrangement of levers whereby the track is vertically moved to cause the truck to be relieved of the load-platform and to receive it again.

WAGON-BRAKE.—F. W. Dobbel, Purissima, San Mateo Co. No. 486,245. Dated Nov. 15, 1892. The object of this invention is twofold—first, to provide such an arrangement and construction of the operating lever as will give on the backward throw thereof the greatest amount of movement in order to fully throw off the brakes from the wheels, and on the forward movement to give the greatest purchase or leverage for forcing the brakes to the wheels; and, second, to provide simple and effective means for holding the brake-block to the beam, giving great stability and means for tightening it up when loosened.

CASH-CARRIER.—A. B. Gunzendorfer, Monterey. No. 486,250. Dated Nov. 15, 1892. This is one of that class of cash-carriers in which the car is propelled from one end of the track to the other by means of a sudden force applied at either end. The object of the invention is to provide effective means for receiving and locking the car at the end of the line, releasing and immediately projecting it on its travels, regulating the power of the propelling device, adjusting the track to any suitable inclination and releasing the cashbox in its casing.

CLAMP FOR SECURING STEREOTYPE PLATES.—Wm. Filmer, S. F. No. 488,160. Dated Nov. 15, 1892. The invention relates to the class of devices for securing stereotype plates to their blocks, and particularly to those clamps which are detachable from and independent of the block and fit against the sides thereof when locked up in the chase. The present invention though adapted to any detachable or independent clamp which lies against the stereotype block or bed, is especially intended as a direct improvement on that clamp patented by the same inventor, Dec. 13, 1887, No. 374,667.

SAFETY HARNESS.—James T. Smith, Oroville. No. 486,238. Dated Nov. 15, 1892. The invention relates to that class of harness in which the traces are attached to the whiffletree by means of a trip-connection under the control of the driver, and the invention consists in certain constructions and combinations of devices. In case of a runaway, the driver can instantly release the traces, whereby the whole harness will slide forward free of the shafts and allow the horse to become disengaged.

NOTICE OF ASSESSMENT.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 22d day of November 1892, an assessment (No. 70) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the TWENTY-EIGHTH DAY OF DECEMBER, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of January, 1893, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

A THOROUGHLY PRACTICAL AMALGAMATOR and Assayer desires a position to take charge of a gold mill or assay office.

Especial attention given to the treatment of base ores and slimes.

Address for references, stating wages,

Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodhurr" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

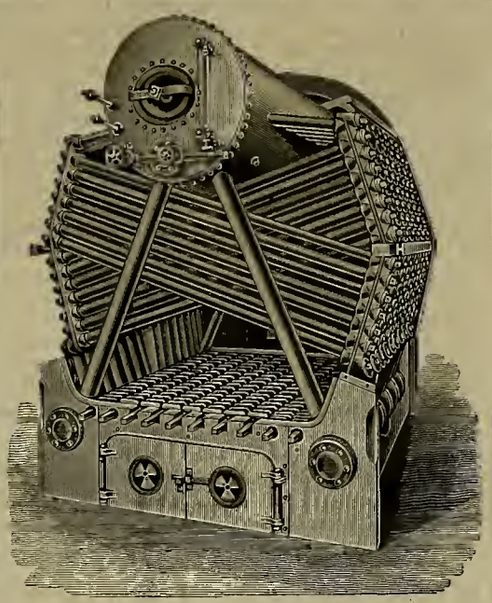
The Worthington Sectional Water-Tube Boiler.

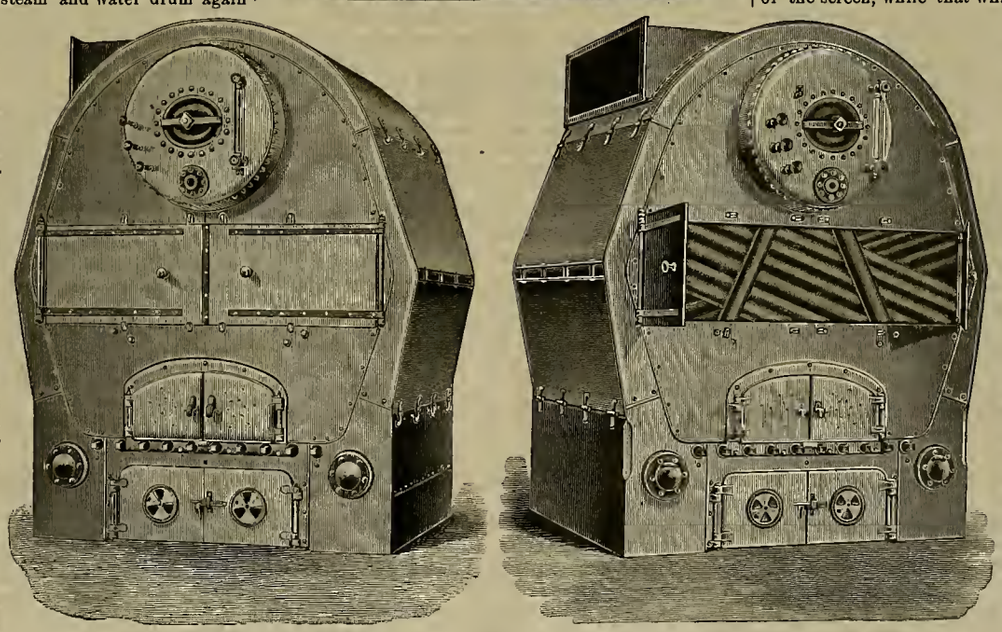
This boiler belongs to the sectional class, in which the water is contained in small tubes and chambers, designed to secure the requisites of safety, durability, accessibility and high evaporative efficiency. It is constructed of material of superior quality, and with a degree of mechanical excellence equal to that employed in the manufacture of first-class machinery; hence, very high pressure may be carried with safety and freedom from leakage. It is designed to be economical of valuable space, and at the same time to be of liberal proportions in grate area and heating surface. The interior of the entire construction is readily accessible from the outside for examination, cleaning or repair. The furnace extends under the entire boiler, and is of proper height to permit the use of any kind of fuel. As will be noted, upon reference to the cuts, the tubes are arranged in transversely inclined series of several tubes. Each tube is straight, and every tube end is expanded.

Every tube is wholly in the furnace, directly over the fire, and exposed to the full effect thereof; and every square inch is thus employed as active heating surface. The heating surfaces and water-ways are so arranged that the movement of the water contained in the boiler is constant and rapid. Its course is as follows: From the steam and water drum located above the tubes, into which water is fed, it descends the water legs—four in number—placed outside the furnace, to the water and mud drums at the base; thence it passes via the tube connections into the lower series of headers; thence through the tubes, over the fire, into the upper series of headers; thence via the tube connections into the steam and water drum again from whence it started. The proportion and combination of parts throughout the boiler is such that expansion and contraction, due to changing temperatures, can occur without straining or disturbing the position of any part or system of parts. The tubes being short, tubular expansion is reduced to a small fraction, as compared to that which is due to the employment of tubes of 16 to 20 feet long.

These boilers are proportioned and rated for generating power on the basis of the Centennial standard—namely, the evaporation of 30 pounds of water, at 70 pounds pressure, from temperature of 100°—to be one horsepower; said duty to be accomplished with a consumption of anthracite coal of good quality, at a rate of 12 pounds per hour per square foot of grate with good natural draft. It is to be understood that the actual steaming efficiency, and also the ultimate capacity, is largely in excess of the rating on above basis.

In a water-tube boiler the elements which insure safety are numerous. Primarily, in the strength of the parts which are combined; secondly, in the reduced areas exposed to rupture; thirdly, in the distribution of the total strain. It follows that a boiler composed chiefly of boiler-tubes, which, when of standard make and perfection, possess an enormous resisting power, as against explosion, is far advanced in the direction of safety in comparison with any type of boiler in which tubular area is a mere fraction of the total area subjected to explosive force. This boiler is very compact. A boiler of 200-horsepower can be passed through a 4′x4′ doorway, window, or sidewalk opening. A boiler of 100-horsepower occupies a floor-space 7½ feet square, and is less than 10 feet high. This boiler (Worthington patent) is manufactured by the New York Safety Steam-Power Co.





THE WORTHINGTON SECTIONAL WATER-TUBE BOILER.

THE Dardanelles drift mine of Forest Hill has made a contract with the Electrical Engineering Company, of San Francisco, for the introduction of an electrical plant for lighting, pumping and general power purposes.

A CHUTE of rich ore has been struck in the Yellow Diamond mine at Nevada City. Mr. A. F. Dunnington, Superintendent, is accordingly rejoiced.

Improvements in the Tulloch Concentrator.

James Tulloch, of Angels, Calaveras Co., has just patented several important improvements in the concentrator which bears his name. In this new machine the material to be concentrated is delivered in the form of a pulp upon the upper end of a screen mounted on the top of the frame and extending across the belt. The floor of this screen inclines in the same direction with the inclination of the belt, so that the material is delivered upon its upper end nearest to the discharge end of the belt, and is delivered off the screen at a point farthest from the discharge end of the belt. In this respect the arrangement differs from that of other feed apparatus which usually delivers in the direction in which the belt is traveling, and toward the discharge end instead of away from it. The floor of the screen is perforated with different-sized holes so as to form a mesh or screen opening which is finer near the upper end, and becomes coarser toward the discharge end. The inventor prefers to make the openings near the upper end of about the size known as fifty meshes to the inch. The intermediate portion of the surface may have the mesh of forty, and the lower end thirty to the inch. The pulp is delivered upon the table, and the very finest portion will pass through the upper end of the screen and fall upon that portion of the upwardly-traveling belt which is just beneath. This carries also the finest of the sulphurets and they are thus separated at once from the coarser material and are not subjected to the influence of the heavier material, which is more liable to carry them away. The next coarser material will fall through the middle portion of the screen, while that which is still coarser will fall through the lower part of the screen, and any which is too coarse to fall through the screen will pass over the lower edge. A separation is thus accomplished of the different grades upon the screen before they fall upon the belt, and they are delivered upon the belt in the order of their fineness, the finest uppermost and the coarsest at the lower end.

The operating mechanism of the concentrator is such that the proportion of the backward and forward strokes may be made to suit the condition of the material to be concentrated. It is so arranged that the forward stroke will be twice as much as the backward stroke, and the inventor therefore has an oscillating motion of the belt in the direction of its length, and at the same time the belt is gradually traveling upward to carry the concentrates over the upper drum or roller and deliver them at that end of the machine. By this means he is enabled to produce a more perfect concentration than heretofore.

There is also a new mechanism by which the belt is kept level transversely, and a novel clutch mechanism by which the belt is caused to advance gradually in the direction of its length during its oscillations. There are tubular flanges on the edges of the belt, with intervening longitudinal ribs and diagonal raised bars converging from the sides toward these central ribs, giving a tendency to draw the concentrations toward the center.

Comment.

There is in the vicinity of Redding, Shasta county. a large deposit of sandstone, some of which has been quarried. Tests of this stone show it will stand a pressure of about 5500 pounds to the cubic inch, which makes it good for building purposes. The stone has been used locally, but none has been shipped to this city on account of the freight rates. An effort has been made by the secretary of the Shasta County Miners' Association to get the railroad company to fix a rate which would admit of this stone being quarried and shipped. In this he has been successful. After giving the matter careful consideration, the railroad company has decided that if the people will open the quarries, and compete actively in the San Francisco market for sandstone, the desired rate will be given, viz., $2.50 per ton of 2000 pounds for rough stone in carload lots, cars to be loaded as near as practicable to marked capacity. On dressed stone the charge will be $3.30, subject to same conditions. The railroad officials say they would not care to inaugurate so low a rate as this, which is lower than anything they have heretofore quoted, unless there promised to be an active development of the quarries. It is probable that with this rate, this stone will now come to this city in quantities as soon as the quarries can be put in good shape for work.

With the rapidly increasing numbers of overhead or trolley-system electric railroads in this State, supervisors and councils should consider the necessity of enforcing some rule about guard-wires. As these are not necessary to the operation of a road, and entail additional expense on the company, they are not apt to be adopted except upon compulsion. There are in Oakland for instance, many miles of electric railread wire stretched, and not a single guard wire. Two horses were killed this week, and one man shocked by other wires bringing the current down within reach. East, in the cities, the roads all have guard wires to prevent falling telegraph or telephone wires coming in contact with the main trolley wire. Tbese conditions should be enforced here wherever the roads are started. There should be a general law to cover the matter, but while there is not, city councils and county supervisors granting franchises should make the use of guard-wires one of the conditions. It takes two guard-wires to each single trolley wire, and where, as is commonly the case, double track is used, and there are two trolley wires, four single or two double guard-wires must be used. This is lighter than the main wire but costs money, and thus far the electric railroad companies have succeeded in staving off any compulsory order for their use. It is time to call a halt, however, and compel the general use of guard wires for the safety of the public.

The whole State of California has received a pretty thorough soaking, the rains during the recent storm having been general. While the wind was of unusual violence, no extensive damage was done. In this city a few old and new buildings were blown down, and some damage was done to chimneys, fences, signs, etc. The railroad and telegraph companies will have some extra bills to pay on their lines; but in general the storm has been of great benefit. The streams and ditches on the mountains are now all full, and such mills and mines as have been shut down or running on part time for want of water, can now start up. In this State there are not very many places where the winter closes down mining operations, for even at the higher altitudes the well-equipped mines continue work. Of course in some sections the smaller operations cease, but the recent storm has started up as many mines as it has closed down.

The systematic manner in which the delegates to the International Monetary Conference are going into the silver problem gives rise to a feeling of confidence that some kind of concert of action will be arrived at which will point the way to rehabilitating the white metal. This feeling is strongly emphasized by the conference calling for the proposals of the American delegates (who are supposed to represent the bimetallic side of the question) and following up the same by having the English delegates, through Baron Rothschild, submit theirs. In securing the proposed plans of the two extremes and submitting them, together with proposals of delegates from other countries, to a committee, the rough points can be rounded and a general plan adopted which will meet the approval of all nations interested. The American delegates' proposal embraced that of Moritz Levy and also that of Dr. Soetber (both noticed at length in the commercial department of this paper on Oct. 15) and another proposition of their own formulation. Dr. Soetber's plan had been previously submitted to both the German and French delegates, and by them was received with favor. But the plau which attracted the greatest degree of interest, and toward which financial eyes are focused, is that proposed by Baron Rothschild on behalf of the English delegates. His proposals are that America continue the purchase of silver and the Euopean powers buy an amount equal to £5,000,000 a year for five years at 43d. If silver should rise above that price the purchases are to be immediately suspended. It is expected the proposals will be referred to a committee. It is stated that Rothscbild proposes to raise the legal tender of silver in England from £2 to £5. Great importance attaches to the proposal, as it means the English £5 would be payable in silver. The Rothschilds' proposal was referred to a special commission of fourteen delegates. The same commission was instructed to consider and report on the plans of Moritz Levy and Adolph Soetber, mentioned in the proposals of the United States delegates. The commission on the American proposals will sit daily and will report to the conference.

Obtaining Title to Mineral Ground.

Many miners in this State are encountering serious difficulties in the way of securing patent, or of demonstrating their rights to claims which are plainly mineral in character and to which they should unquestionably be entitled. This is due to several causes: First, the claim may be upon an odd section listed to the railroad company. Some one has either ignorantly or fraudulently attested to its nonmineral character, and the application for patent is rejected in the Land Office. To be sure, the railroad company's title may be purchased for what it is worth, but it is by no means satisfactory. It is subject to attack, and can in no case carry with it extra-lateral right, or the rigbt to follow a vein on its dip into neighboring ground.

Second, the Commissioner of the Land Office may refuse to pass on application for patent, holding arbitrarily that the mineral character is not shown, and prescribing an impracticable method of proof.

Third, we have no satisfactory law to govern "annual assessment work." It is difficult to prove that work has *not* been doue by a fraudulent adverse claimaut. An old abandoned claim may be relocated and worked in good faith, with the moral conviction of sole right, yet title cannot be guaranteed, as the old claimant may come in at any time and maintain by false oath that he did the annual work from year to year, and it is difficult, often impossible, to prove the contrary. This is a more important point than it may seem, but has given the drift miners, for instance, considerable trouble. There should be some means of proof of labor outside the individual claiming to have performed said labor. That is, there should be some compulsory record and a properly authorized official to see that the labor has been actually performed before such record is made. In default of such official proof and record the subsequent claimant would be more sure of his ground.

The alleged owner of an old, loosely described and improperly marked claim may float his boundaries onto the discovery of a valid claimant, and prove them by false testimony.

Thus it too frequently happens that a valid claimant cannot prove his right, and is thwarted in his effort to secure capital to open his mine. These difficulties can doubtless be remedied, or at least greatly reduced, by the enactment of suitable laws.

Regarding railroad title to mineral land, it is not presumed that further congressional enactment may be had. The questions involved doubtless belong in the courts.

Concerning the difficulty of proving "mineral character," however, we should be able to obtain more direct relief. There is an urgent need for a uniformly just and simple criterion. The present practice of the Land Office is irregular and at times decidedly unsatisfactory.

We should be able to obtain through Congress some definition or some provision for determining the "mineral character"; something definite to govern the rights of claimants and the practice of the Land Office.

The "annual assessment work" is not an easy matter to govern. Tbere is at present a State law requiring the recording of proof of the annual work, but it does not seem to be the uniform custom to comply with this requirement. It is, moreover, held by some that Congress alone can enforce such a requirement, and that the State has no jurisdiction. Furthermore, it is a matter of very little risk for a dishonest claimant to swear to $100 worth of labor when not one-tenth of that amount has been performed. It is a difficult matter to disprove his statement. It ought not to be left to the claimant to determine whether or not he has complied with the law. Perjury should not receive unnecessary encouragement. The annual assessment work is generally wasted on an undeveloped property. Especially is this true in the case of drift mines, where such work too often consists in shallow pits sunk in the barren surface material, and has no important bearing whatsoever on the development of the mine.

A free discussion of these questions is desirable, since suggestions from intelligent men of mining experience might lead to a remedy. The Committee on Legislation of the State Miners Association has the whole matter under advisement, and invites suggestions from those who feel sufficiently interested to send in their views in writing. As a basis for discussion this Committee has formulated a proposed Act of Congress which would cover the ground broadly. After further deliberation the Committee proposes to prepare a section to be iuserted as an amendment to the U. S. Mining Laws, and urge upon our Congressional delegation the desirability of its passage by Congress. The proposed section as at present drawn is as follows:

An Act Concerning the Entry and Patent of Public Lands—Mineral in Character.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that no lands shall be subject to entry and patent except as mineral lands, which lands are situated in any locality known to be valuable for deposits of gold, silver, cinnabar, lead, tin or copper, unless it shall be clearly established that such lands do not contain in paying quantities deposits of either gold, silver, cinnabar, lead, tin or copper.

The MINING AND SCIENTIFIC PRESS will devote reasonable space in its columns to a discussion of this subject, and correspondence is therefore invited. What is mainly wanted is some suggestions for a practical remedy. Doubtless many of the mining counties of the State, that have experienced difficulty under the present conditions, have some ideas which would help tbe matter out. The State Miners Association, through its Legislative Committee and Executive Committee can bring the subject to the attention of lawyers, when a suitable Act, covering the points, is formulated.

World's Fair Mineral Exhibit.

A resolution was adopted at the recent mining convention that a committee be appointed to see that the mining counties make a full and representative exhibit. In accordance with this resolution, President Neff has selected the following a committee on the World's Fair mineral exhibit: Dr. Wm. G. Hodson, chairman; S. B. Call, Amador and El Dorado; Andrew G. Myers, Siskiyou; John McMurray, Trinity; E. B. Price, Lassen and Butte; Chas. F. Hoffman, Placer; August C. Busch, Sierra; Alf. Tregidgo, Nevada; Chas. Bogan, Mariposa; David Oliver, Tuolumne; A. F. Bryant, Mono; Jas. O'Brien, Yuba; Chas. H. Hendle, Plumas; John F. Davis, Calaveras; Henry Martin, Chas. G. Yale, N. J. Brittan, San Francisco. Dr. Wm. G. Hodson (Shasta county) was chosen as chairman, as his system of collecting and classifying ores and economic minerals had proved practical and satisfactory. A description of this system and other essential information has been issued by Dr. Hodson for the State Commission. Copies can be had from members of the committee, and a number have been placed in tbe office of the MINING AND SCIENTIFIC PRESS, where they may he obtained on application.

Coast Industrial Notes.

ONE-THIRD of the town of Jerome, where the works of he United Verde Copper Company are located, was destroyed by fire last week.

A PROMINENT Omaha firm has sent an inquiry to several Tacoma and Seattle firms for 500 carloads of cedar shingles for spring delivery.

ON the Miner Ranch, near Lafayette, Contra Costa Co., they are boring for oil, with favorable indications. Oil has been found in the 200-foot well, but as yet not in sufficient quantity to pay.

CONTRACTS for the new passenger and freight depot at Baden were let last week, and the work is now well under way. All the material for the structure has been delivered. The new depot, which is about 120 feet long, will answer the purpose until the completion of the new bayshore line, when a much finer structure will be erected.

A COMPANY has been organized in Los Angeles for the manufacture of glass and has applied to the City Council for a lease of land alongside the river. Besides river sand, from which ordinary glass for bottles, fruit jars, etc., can be made, the company has secured control of several deposits of fine sand in this neighborhood, from which glass of high grade can be made.

THE City Council of Ogden and the county of Weber have appropriated $40,000 as a bonus to induce the Southern Pacific to remove its shops from Carlin, Nev., and Terrace, U. T., to Ogden. A contract has been signed by all the parties and the removal takes place at once. The railroad company agrees to employ at least 300 men in the shops and to enlarge the plant as the business requires.

A DISPATCH from Phœnix, A. T., says: Articles of incorporation have been filed by the stockholders of the Phœnix, Mount Olive and Mesa Railroad Company. The capital is $1,500,000, and it has already been raised. The incorporators are local and Massachusetts men. The proposed line is to be twenty-five miles in length and will take in all the principal towns in the valley. The work of construction will begin immediately.

THE officials of the Sunset Telephone Company made public the fact that a line connecting Fresno with San Francisco may be be built. The intention is to run the wire by way of Hollister, through Panoche or Pacheco Pass. From Hollister the line will pass through Gilroy. The exact route has not yet been decided upon, and will not be until Mr. Gray makes his report. The work of construction will commence soon after the route is decided upon.

SPRUCE (or Washington pine, as it is sometimes called) will in the near future become one of our most valuable woods. Some day the clearings in the forest will be full of woodenware factories. Spruce is especially valuable to the manufacturers of tubs and pails, because it does not communicate taste or odor of the wood to the contents. This fact is especially pleasing to butter makers, as butter very easily absorbs the flavor and odor of the utensils in which it is packed. The same is true of nearly every article of food packed in tubs, pails and boxes.

JAMES G. FAIR and George Whittell applied to the Supervisors for a franchise for an electric road on Van Ness avenue in this city, and there was such a very vigorous protest and opposition all along the line from the property-holders that the application was withdrawn. Already, between Market and Filbert streets, Van Ness avenue is crossed by fifteen lines of cars, the first of which is the Oak-street line, crossing the wide avenue on Fell street, and the last the Union-street cars, and these fifteen lines afford all necessary means of transportation. Senator Fair wanted to tap his numerous blocks of land on the bay shore, at the foot of Van Ness avenue.

EDSON F. ADAMS has recorded a contract with Darby, Laydon & Co. to construct a bulkhead along the northerly harbor line of Oakland harbor from the easterly line of Alice street, extended southerly to the eastern line of Fallon street, extended southerly in accordance with plans and specifications prepared by L. J. LeConte, civil engineer. The specifications show that piling is to be driven to the water line and backed with filling to form a wharf along the entire frontage of the bulkhead. This wharf will be 1600 feet long. The marsh back of it is to be filled in to city grade, and on this warehouses, etc., are to be erected. The lumber for the work is all on the ground, and the pile-drivers have commenced operations.

FOLLOWING is the salmon pack of the canneries up the coast to date: Gardiner Packing Co., Umpqua, 14,000 cases; Florence Packing Co., Siuslaw, 5000 cases; C. Timmins Packing Co., Siuslaw, 11,500 cases; Alsea Packing Co.. Alsea, 4000 cases; Elmore Packing Co., Tillamook, 18,000 cases; Nehalem Packing Co., Nehalem, 10,200 cases; P. J. McGowan & Sons, Wilpa Harbor, 14,500 cases; United Canneries, Gray's Harbor, 17,000 cases. This makes a total of 93,700 cases. The Columbia river fall pack will amount to about 12,000 cases, making, with the foregoing, an aggregate of 105,700 cases. Allowing for estimates and discrepancies, the fall pack may be deemed, in round numbers. 100,000 cases. The quality of the salmon has been unusually good this season. Most of the fall pack has all been placed and is practically out of first hands.

THE State jute mill at San Quentin was established about ten years ago with a plant of 100 looms and a capacity of 2,500,000 bags annually. Six years ago the Legislature appropriated $160,000 for machinery to double the capacity of the San Quentin mill. The prison authorities are now putting in the plant, and by another year the capacity will be 5,000,000 bags. Several attempts have been made to introduce the manufacture of grain bags at Folsom prison, but some objections were made, mainly on questions of local conditions. The principal of these are the dryness of the atmosphere, which causes a shrinkage in the jute, and renders it brittle and liable to break. Folsom being on the line of a railroad, the freight charges on the product, water transportation not being available, would be very large, and would increase the cost to the farmer.

IN the last monthly bulletin of the General Electric Company is found this list of electric roads, built or contracted for in Oakland, with the mileage of track and number of cars:

Lines.	No. Miles.	No. Cars.
Highland Park and Fruitvale	6½	6
Oakland Consolidated Street Railway Co..	15	30
Oakland, San Leandro and Haywards	16	25
Consolidated Piedmont Cable Co	10	10
Oakland Railway Co	16	32
East Oakland Street Railway Co	6	6
Total	69½	109

The Alameda Company has nearly completed five and a half miles of track, and when it shall have built all the line it has franchises for, it will have ten miles of track and will run 14 cars. This will make a total of 79½ miles and 123 cars. This does not include about 4½ miles of double track, or 9 miles of single track, of the Piedmont cable road. It is a fine showing, and one which no other city on the coast, unless it be Los Angeles, can equal. This has all been done in two years. The most recently completed of these electric roads, the East Oakland street railroad, is now running regularly. The tracks and wires of the Telegraph avenue line are ready, but the road will not be operated for another month. This will be a first-class road.

IT is proposed to establish cordage or rope works at the State Prison at Folsom, when the water power from the American river will be utilized. The cordage of the United States is practically under one immense trust, the National Cordage Association. This trust makes no shipments to this coast, the business here being controlled by the Tubbs Cordage Company, which has a fully paid up capital of $1,000,000. This company fixes prices on this coast, and holds the market absolutely. The National trust is so powerful that no private corporation could possibly compete with it. The only possible competition is the State, with its free labor and free water power: It will remain with the legislature to make an appropriation for the machinery and plant, and the labor of the prisoners can be utilized.

FROM the statement made by one of the surveyors connected with the San Francisco and Great Salt Lake Railroad, that concern intends to commence active operations about the first of the year. The branch line between Fruitvale and Stockton has been surveyed, and the new line will be shorter by twenty miles than by the present line. On the first of the month the field surveyors completed their work to Reno, Nev. The route is outlined to commence at Bay Point. It will then run to Suisun bay, which it will cross at Benicia. The survey then skirts the Sacramento river to the capital city. Marysville and Oroville will be the next points touched at. The route then runs up the canyon of the North Fork of the Feather river. At the end of this it will run over the Sierras and thence to Reno, Nev. The Stockton branch has been surveyed over the Moraga rancho, and will enter through a tunnel about two miles above Mills' Seminary. The surveying party has been ordered to report for duty on the 2d of January.

THE Santa Margarita gap will be closed before next winter, and through trains will then be running to the East through San Jose. The work of tunneling through the mountain, is being vigorously pushed by McMurtrie & Stone, the contractors. The rock which is being tunneled is very hard and is black in color. It has the appearance of coal. Beginning at what is known as the Cuesta grade a large number of men is engaged in blasting rock away from the mountain side. There are three shifts of men working on the tunnel day and night. They have eight-hour shifts. The tunnel will be 1400 feet long and will bear the name of Borondo tunnel. The men are already under ground on the Santa Margarita side and the tunnel now reaches sixty feet under ground. The money for the work will not be paid until the tunnel is completed. At present the work is a little slow, as the ledge of the hard rock has been encountered, but as soon as this is passed the contractors think they will reach sandstone, and then the work will be easier. A track has been laid to the tunnel, and as soon as the rock is blasted it is piled in the gravel cars and carted off. As the work progresses the tunnel will be boarded up with 12x12 scantling, five inches apart. Work on the San Luis Obispo side has already commenced and is being rapidly pushed. All culverts on the line of the new road are made of sandstone and cement, and the roadbed will be the best in the State. The tunnel will probably be completed in six or eight months.

THE application of the San Francisco and West Shore Improvement Company for a railway franchise on Twenty-fifth street, Potrero avenue and other thoroughfares was defeated at the meeting of the Board of Supervisors, not receiving the necessary majority vote of all the members. The application of Messrs. Sherwood, Goodall, Burns, Reed and others for a franchise to construct a railroad in the northern part of the city, along First avenue, Fulton, Scott, Fell, Webster and other streets, was defeated. An order was passed to print granting the City Railroad Company the right to extend its tracks, commencing at the intersection of Silver avenue with Mission street, along Mission street and the new county road to the county line; also commencing at the intersection of Mission street and Richland avenue, along the latter avenue and along Andover avenue, East Park street, Holly Park avenue, West Park street and Holly street from Mission street to Richland avenue; also commencing at the intersection of Mission street and Cortland avenue, along Cortland avenue, Butler street, Blaine street, North avenue, California avenue, Powell avenue; also from Mission street along Twenty-ninth to Noe. An order granting to the Presidio and Ferries Railroad Company a franchise over Baker street from Jefferson and on Greenwich from Baker to Franklin was passed to print. A petition was filed by Joseph G. Wall and John Harper for a railway franchise from the intersection of East and Commercial streets along Commercial, Davis and Pine to Central avenue; commencing at the intersection of Devisadero street with the waters of the bay, then southerly on Devisadero to Grove street; commencing at the intersection of Pine and Laguna to Market, across Market, along Guerrero, to Fourteenth, to Dolores, to Nineteenth; from Noe along Twenty-sixth to Potrero avenue; from Devisadero along Grove to Stanyan; from Devisadero along Eddy to Mason, to Market; from Devisadero along Washington, First avenue, Lake street, Eighth avenue, C street to the Ocean boulevard; commencing at the intersection of Eighth avenue and C street, along Eighth avenue to the park.

MRS. HARRIET W. R. STRONG has made quite a financial success raising pampas plumes on her ranch in Whittier, Los Angeles county. Here she has a place of 220 acres, of which 150 acres are set out in walnut trees. Between the rows of these the pampas plumes are grown. Before Mrs. Strong went into the business the plumes which were sold throughout the world came from South America, and while people admired their graceful beauty they were very unsatisfactory for ornamental purposes, owing to the fact that the feathery plumage soon dropped off. It was not until Mrs. Strong began raising them on a large scale that a successful effort was made to find some means of obviating this. To Mrs. Joseph Sexton of Santa Barbara is due the credit of first discovering the curing and preserving process which is now in successful use. As it is now, when the plumes leave Mrs. Strong's curing establishment they have been so treated that they may be handled, practically without danger or injury. From the very beginning of her operations Mrs. Strong has been very successful in finding a market for her wares in Europe, and the special object of her efforts just at present is to increase the American demand. In this she is meeting with encouraging success. Last year Mrs. Strong raised 2,000,000 plumes, the crop during the present season being 1,750,000. Of these 100,000 were sold in this country for use during the campaign, and 650,000 were disposed of in Europe. The remaining 1,000,000 were reserved for use at the World's Fair, 10,000 being needed for the interior decoration of the California building alone.

Personal.

W. J ROE, an old timer of Bristol, Nev., has gone to Kingman, Arizona, to settle.

JAMES W. MICHAEL is running a leaching plant at the White Hills, A. T.. and seems to be making a success.

FREETHY and Tallon, the Mountain View team, won the championship in the drilling tournament at Butte, Montana.

JAMES L. FLOOD and Nat Messer have returned from the East. They report that John Mackay will not be back on this coast for two months.

J. C. MACKENZIE, of Creede, Colorado, has gone down to Kingman, A. T. He is interested with John Burnett in mines in Gold Basin and also in White Hills.

JONATHAN JEWELL, who used to mine in this State and Nevada in early times, was run over by a train and killed at Great Falls, Mont., last week. He was 92 years of age.

JOHN MARSHALL and Parker Holloway have sent in a small lot of the richest ore ever shipped from White Hills. The sample assayed nearly 2700 ounces silver and a few ounces in gold.

ANOTHER change has been made in the superintendency of the Oakland Consolidated Street Railway Company. David Rutherford has retired from the position, and he will be succeeded by J. Simms.

MAJOR J. W. POWELL, Director of the U. S. Geological Survey, who has been in California for a couple of months, has left for Washington, going first to Oregon and thence East by the Northern Pacific.

CAPTAIN GEO. A. NIHELL has returned to Nevada City from Forbestown, having completed his contract at the Gold Bank mine. It is said that Captain Nihell has been appointed agent for the estate of the late D. R. McKilican, and will take charge of the affairs at North Bloomfield.

F. FORMHALL, mining engineer, has been in charge of the survey of the outlet of Clear Lake for the purpose of utilizing the waters of Cache creek for electric motor purposes. The scheme proposes to take the water from the creek or lake and conduct it a distance of about six miles in iron pipes, where it is to be utilized for the purposes mentioned.

W. H. SMITH, general manager of the Star mine, near Hailey, made his first visit to Ketchum last week. Mr. Smith's mission was to examine some valuable mining property. "Hank" Smith, as he is familiarly called, is a thorough mining man and is well known all over the Pacific Coast, he having managed some of the large mining enterprises in Nevada, Utah, Arizona and Mexico.

CAPTAIN B. J. REILLY, Jim Smith and Harry Fleichman, three well-known and experienced miners of Tuscarora, outfitted at Elko last week and departed on a prospecting trip to the Colorado river. They had a light, covered wagon drawn by two horses and a saddle horse. Their route will be by the way of Fort Halleck, Butte Valley, Hiko, Mountain Meadows, and south into San Bernardino county, California.

CIVIL ENGINEER OTTO VON GELDERN, who has been making an official survey of the Yuba and Feather rivers for the purpose of ascertaining the most feasible location for the proposed change or cut-off in the channel of the Yuba river, has about completed his work and will soon file his report and recommendations with his superior officers. He has been making the survey under the direction and in behalf of U. S. Engineer W. H. Heur, of this city.

Quartz Mines of Placer County.

By Our Traveling Correspondent.

AUBURN, Nov. 21, 1892.

TO THE EDITOR:—Quartz has never assumed pre-eminence in Placer county mining; neither has it been insignificant. It has remained in great part undeveloped. In the divide region, it is well-known that there are many rich, unexplored metalliferous veins, yet, with two notable exceptions, that whole country is given over to gravel enterprises. The Ophir district, two miles west of Newcastle and four miles south of Auburn, is the only locality that is noted for quartz; and with 80 or 90 claims and a half-dozen or more mills, it has scarcely one property that has worked with the continuity of a generally-considered successful camp or mine. Rich finds from time to time have created temporary and small-sized booms, never anything of a dangerous form though; but there has been a lack of a number of things, which, if possessing them, would have made this a great mining camp long ere now. Rebellious ores and litigation have caused the mines, that would otherwise be the best, to shut down. Many of the mines that have proved the richest are in what is known as specimen ledges, in contradistinction to continuous milling ledges.

There are good mines in the district, and some are now being reopened or opening for the first time. Their development is likely to be prosecuted on a more systematic and business-like plan than in the past, and there is no legitimate reason why some of the best mines in the county should not rise here.

THE GOLD BLOSSOM AND THE CYANIDE PROCESS.—Mr. C. F. Reed of Auburn is owner and superintendent. The property has a ten-stamp mill and a reverberatory furnace. Owing to the presence of antimony and arsenic in the ore, it has been impossible to extract more than 30 per cent of the free gold. Thus, ore of an assay value of $20 would mill but about $6. Still, the sulphurets are very rich, giving average returns of $330 per ton of concentrates, saving 2½ per cent. In order, if possible, to work this rebellious ore to advantage, Mr. Reed, some time ago, dispatched a man to Denver to make a thorough study of the MacArthur-Forrest process with a view to introducing it at the Gold Blossom. Samples were taken, and in the laboratory the most satisfactory results were obtained. After an extended study, the agent returned enthusiastic. Tanks and the necessary plant were constructed to treat the ore on a large scale. But here, as seems to have been the case in many other instances where it has been endeavored to introduce the cyanide process on a practical working scale, it has proved a signal failure. Mr. Reed cannot be accused of having come hastily to his conclusions, as it was as much to his interest to succeed as to any one's. A faithful and conscientious trial of over three months with continued experiments failed to bring about results approaching anywhere near satisfaction. The Denver Co. sent a special agent out and he pronounced it unsatisfactory, and could offer no improvement. The company wanted to buy the mine when the process was first being introduced, but when the result of the trial became known, they went back on their offer. The trouble with the process at the Gold Blossom was in getting the gold *out* of solution and free from the zinc. For the past two months the mine and mill have been shut down, and will not be reopened till some satisfactory way of working these ores is found.

THE ST. LAWRENCE AND THE CRAWFORD MILLS.—The St. Lawrence has lately started up, with considerable promise of success. Whether it meets the full expectations of its promoters, and of all interested in legitimate mining, or not, the progress of work here will be followed with much interest, as this mine is introducing the Crawford mills as a permanent plant. The mills have been put in here by the superintendent, Mr. J. R. Richardson, who has had considerable experience with them on ores from all over the world, particularly those of Australia and South Africa. The Crawford mill is one more addition to the list of the centrifugal type, and those who have seen it in operation pronounce favorably upon it. Its principle is much that of the ball-bearings of a bicycle. A disc revolves close to the bottom of a pan and so fitted as to cause nine heavy balls to roll continually in a circular-grooved space of the disc and the sides of the pan. The edges of the disc and the sides of the pan all but touch, leaving a small space through which only the gold and the sulphurets find their way. The bottom of the pan is covered with quicksilver through which, from below, is a continual flow of water, carrying back all mud, sand and other gangue material. The mill is nearly spherical in shape and the waste makes its escape from the top. Screens are entirely unnecessary, as nothing can pass off except by being carried upward in suspension and flow away as finest silt. For this mill it is claimed that it saves 50 per cent of the losses of all other mills; it is the most perfect amalgamator, saving free gold and sulphurets alike. There is no use for screens, plates or riffles, for everything is caught in the mill and drawn off when desired. There is nothing complex about the mill, very little noise, small power necessary, and the mill itself is as compact as a teapot.

There are two 5-foot mills at the mine, with a capacity of from 5 to 10 tons each per 24 hours. The two crush now 10 tons in that period, though that amount could be doubled. When I visited the mine they had been in operation about three weeks and were giving perfect satisfaction, and seemed to be working up to their full claims. The sulphurets, in cleanness, are not distinguishable from those taken from any of the concentrator belts ordinarily in use. They are not ground to powder either, it only being necessary for the granules to be of sufficient size, from ⅛ to ¼ of an inch, to pass to the bottom of the pan.

One of these mills could probably do the work of a 5-stamp battery on moderate rock. I do not believe it would be applicable in gravel-crushing, as here large capacity is a main thing and fine pulverization less necessary, and the natural preverseness of gravel silt to cement would clog the mill. But for quartz and rock of medium or high grade it should do finely, and for its compactness, comparatively small original cost, and cheapness of maintenance should commend itself to the miners.

The mill is the invention of an American, controlled by English patent. The American rights are held in New York by a company of which Erastus Wyman is the head. Some of the mills are now in use in Colorado, Utah, Montana, Canada, Mexico and British Honduras. Mr. Richardson placed one of these mills last year in the Three Star mine in the Ophir district, about two miles west of the St. Lawrence. While working it proved very satisfactory, but the mine is now closed down. A Crawford is soon to be put in the Allen and Waldeck mine in Nevada county.

The St. Lawrence is generally reputed to be owned and operated by an English company, but is really owned in New York. The mine is opened by a 600-foot tunnel on the ledge, giving 300 feet of backs. A shaft is now sinking on the ledge to connect with the tunnel, and is down 65 feet. The ledge averages two feet in granite formation, with a four-foot seam of syenite on the footwall.

THE MINA RICA.—J. W. McCullough of Auburn, is owner and superintendent. The 10-stamp mill does some occasional custom work. The mine itself has proven very rich at times and in places. It may start again this winter.

THE HATHAWAY MILL of 20 stamps, owned by Valentine Bros. of S. F., has lain idle for three years. Mr. S. Hammill, who is in charge as superintendent, has kept the mine well-timbered and opened, so it is ready to start at any time, which it is likely to do. The mine is opened by a shaft 400 feet, but is not stoped below the 300 level.

The Eclipse 10-stamp mill has lain idle for some time on account of litigating heirs.

There are a number of small mines working on a small prospect plan and that appearances favor.

THE MORNING STAR, or Walters mine, owned by Otto Walters of Ophir, adjacent to the Eclipse, is leased to Holcomb & Miller. From a 45-foot level, 75 feet in, 29 tons of ore crushed in October at the Mina Rica mill yielded $4816, or $166 a ton. The ore, while showing well, does not, of course, all prove so remarkable. The ledge varies from one to three feet.

THE OLD HOPE has yielded some very rich rock in the past. Johnson & Hawkins are prospecting it on a small scale. The rock carries a considerable proportion of silver, generally in larger part than gold.

THE MOORE is owned by Messrs. Thorpe & White. It has a small steam hoist and works its rock by custom. From a 300-foot shaft about $40,000 were taken out in the past three years. This chute of ore being exhausted, a tunnel has been run 100 feet on the ledge, with hopes of striking the chute above, and within a few days, I understand, a very rich body of ore has been met.

THE GOLDEN STAG is being worked by W. R. Monahan. It is a west continuation of the Thorpe ledge. It has a small horse-whim hoist and the shaft is down 90 feet, showing a 15-inch ledge of good prospect, of high grade, and improving with depth.

It is stated that Messrs. Doane and Bryan of the Conrad contemplate milling at the Mina Rica and introducing the cyanide process.

WHITE BROS. are said to be taking good rock from a small mine they have operated for some time. They have a small hoist. Dr. Schnabel, of Newcastle, contemplates putting a mill on his Bowlder property.

THE RISING SUN MINE, a mile west of Colfax, continues idle on account of litigation.

In the Divide region are the Pioneer and Drummond, which for a long time have been the only really operating and paying mines of this character in the county.

THE DRUMMOND.—Hon. C. F. Reed, of Auburn, is owner, and J. L. Grimes superintendent. The mine is situated on Shirt Tail canyon, midway between Forest Hill and Iowa Hill. The ledge is a southeast and northwest one, four feet in width and of average hardness and moderate grade. It has been worked for the past four years with good results. The crushing plant consists of two five-foot Huntington mills. The present working tunnel crosscuts the ledge 300 feet in; 800 feet have then been run northerly on the ledge, where another fine body of ore has been struck, averaging $10 a ton. At 300 feet a winze was sunk 100 feet to determine the depth of the chute, and above this a part has been stoped; but as the ore had to be hoisted here, and again by incline at the mouth of the tunnel to the mill, it proved too expensive working for the present. The mine thus thoroughly prospected and opened, Mr. Reed is preparing to run a tunnel 400 feet lower on the mountain side, as working at present is at a disadvantage with the mill above the tunnel. This new tunnel will be 1200 feet in length. Compressors, power drills, etc., will be put in. A stamp-mill will be erected at the mouth of the new works. A year will be necessary to complete the improvements. At present about 20 men are employed, and from 15 to 20 tons of ore milled per day.

THE PIONEER OR LYNN.—This has a 20-stamp mill, and is situated about three miles northwest of Damascus. The mine is owned by Jas. G. Fair and A. E. Davis, and under the superintendence of Mr. D. J. Sullivan has developed into a steady dividend-payer. There are two ledges on the property, the Pioneer and the Lynn or back ledge. The course of each is northwest and southeast, dipping east at 60°. The Pioneer ledge was worked as early as '58. The Lynn was discovered about eight years ago, and was incorporated with the Pioneer about five years ago. They are both worked through the same channel. A lower tunnel strikes the Pioneer at 400 feet, where it has been stoped a depth of 300 feet. This tunnel has been run ahead 1000 feet to the Lynn ledge, upraised 180 feet and run south on the ledge 500 feet. This drift then connects, by another upraise of 220 feet, with an old tunnel. Work at present is going on in the extreme south end of the drift, stoping and driving ahead in high-grade rock. There are 520 feet of backs and no end of good ore in sight.

The mill is 1100 feet vertically below the mouth of the tunnel, near the river. The ore is transmitted by a gravity tramway 2700 feet in length. Twenty-five inches of water under 600-foot head, with 3-foot Knight wheel, lift 15 stamps of 750 pounds. Five stamps were not dropping on account of slack water. Forty men are employed.

DORER QUARTZ MINE.—This is situated not far from the Pioneer, and between the north and south forks of the north fork of the American river, and is owned by Richard Dorer. It has a ten-stamp mill, which was not running, but was expected to start up before long. This is a small hut good and paying mine. There are three tunnels. The ore is transported to the mill by a 3100-foot tramway.

A short way above and east of this is the Sentinel of the Dorer Bros., a good ledge and a 150 foot tunnel.

Lately some very rich ore has been taken from the Pedlar, a supposed extension of the Lynn. This will probably be bought and operated by San Francisco parties. In the same locality is also the Blue Bell, a good property on which little has been done, but which is for sale.

THE HOMESTAKE.—Near Forest Hill and two and one-half miles east of town is the Homestake quartz mine, with a five-stamp mill. The mine is idle on account of too little funds and too much water. The ledge is nearly vertical, averages three feet, and very loose in structure, carrying immense quantities of water.

THE AMERICAN BAR LEDGE.—This is deserving of attention, as it is likely soon to become the biggest quartz operation in the county. It is situated three miles south of Michigan Bluff, on the middle fork of the American river. It has lately been sold to D. Chapman, superintendent of the Taylor mine of El Dorado county. As early as '55 a 15-stamp mill was built on this ledge, but was carried away in '61–62. The ledge averages 20 feet, and has a general northwest and southeast direction. It has paid immensely rich in the past. In '67 a five-stamp mill was built, which ran a short time, but, through mismanagement and misunderstanding, it shut down and has lain idle for 20 years. Mr. Chapman intends putting up, in time, an elaborate plant, to be operated by electricity. A late assay of ore yielded $15 per ton.

THE IDLEWILD OR TAYLOR MINE.—The Taylor mine, which I have had occasion to mention before, is about four miles below Georgetown, in El Dorado county, and is the most northern point of active development, as far as known, on the mother lode. The ledge strikes northwesterly, dips about 60° east from the horizontal, and varies in width from two to forty feet in thickness, while averaging 20 feet. There are frequent injections of auriferous slates into the ledge. The walls are of diabose, gouge and black slate, and the ledge lacks none of the characteristics of the mother lode veins. The rock is continuous milling and low grade. The mine is developed by a 500-foot shaft, double-compartment, and five levels, the longest of 500 feet. Work is going on in all. The work at present is entirely that of development; no stoping is being done, and the rock for the mill comes from the gangways.

There is probably not a more substantial or more satisfactorily operated mine in this part of the State. When the 20 stamps have been added to the present 20-stamp plant, and improvements now under way concluded, there certainly will not be a better-equipped mine in this northern section. Mr. D. Chapman is superintendent.

The changes and additions that have been going on for some time are about completed. The milling plant thus consists of 40 steel stamps of 1000 pounds each, the 20 lately put in being ready to start in a few days more. The stamps are given a 4½-inch drop and a speed of 105 drops a minute. The screen used is a 50-mesh perforated steel, and the average crushing per stamp is three tons in 24 hours, which is a remarkably good showing on hard rock. The free gold occurs in minute particles. The sulphurets are saved on four Woodbury concentrators. Four more are to be added. A large-size Gates crusher, with a capacity of 25 tons an hour, and of 13,000 pounds weight, is part of the new equipment. A 75 horsepower Dodd wheel has also been put in.

The notable feature of the mine outfit is the electrical lighting and pumping apparatus. Located in the mill is a 25-horsepower, constant-current power-generator. This supplies the two motors in the mine; one at the 500 station, which pumps the water from levels 3, 4 and 5 to the 200 level, where it is taken up with the drainage of 1 and 2 and carried to the surface. These motors are each of ten-horsepower, and drive two Richards pumps, built by the W. T. Garrett Company of San Francisco.

There is also a dynamo furnishing power for lighting purposes. It is a 110-volt machine, constant potential, with a light capacity of 150. There are about 200 lights wired up and distributed throughout the mill, hoisting works, mine, office, boarding-house, lodging-houses, five residences and stable. The special feature of the plant is the underground lighting—the shaft, stations, gangways and stopes are all thus lighted and not a candle is necessary. This entire plant was furnished by the Electrical Engineering Company of San Francisco, and was put in under the direction (and is now under the supervision) of Mr. G. L. Grant, and works to entire satisfaction.

Electrical drilling has been tried, but for the present it was not found to be a success. Electrical drilling machinery is still in an experimental stage and its possibilities yet undetermined. For the present all drilling is done by hand, but it is intended shortly to supersede this method by power drilling.

THE ARGONAUT.—Three years ago the ten-stamp mill was burned, and since this property has remained idle. It is a north continuation of the Taylor lead and one mile distant from that mine. The Argonaut is a full claim of 1500 feet and held under U. S. mineral patent. Mr. John Smith of Greenwood is the owner.

This mine was well developed before the mill burned. There is a 500-foot tunnel crosscutting the ledge 200 feet below the surface, where it is 100 feet in width. At this point there was an upraise of 20 feet and an under stope of about 30 feet. The ore is free-milling and low-grade, said to average from three to five dollars a ton. Owing to the quantity of ore, though of such low average, with cheap and modern facilities for working it, this property would readily prove valuable and is so considered now. The

surface croppings are 40 feet in width, and, as has been seen, the ledge grows with depth, showing an immense gold-bearing ore body. Mr. Smith is desirous of interesting capital in the Argonaut and doubtless the property could be purchased at reasonable figures—generally a scarce commodity among holders of mining claims. However, there is no doubt of the value of this property, and proper men and capital taking hold of it would add one more great enterprise to mother-lode operations in El Dnradn county. CHAS. E. TOWNSEND.

The Ynkon River Placers.

The Juneau (Alaska) *Mining Record* of October, says: On Thursday evening last there arrived in Juneau Mr. Neil McArthur and Mr. Chas. Maynard, the former being a well-known pioneer miner and prospector and a perfectly reliable and truthful authority on mining matters in this section; the latter is also a miner of experience and has been in the Yukon country over a year in duration. Neil McArthur, who has been mining in the Yukon country since 1888, described disinterestedly some facts relating to mining on Forty Mile and other creeks and tributaries, the publication of which may have a good effect upon those who may next spring contemplate going to these diggings, and who may become excited over what is a fallacious report.

After mining on Forty Mile creek and neighborhood with moderate success, he discovered on the 15th of September, 1891, a tributary at the extreme headwaters of Forty Mile creek, and last May a tributary on Sixty Mile creek called Miller creek, all of which empty into the main Yukon river on the south side going down stream. About 130 men wintered there last year and there will be an addition to this number of 40 or 50 during the present winter.

The season is open about the 27th of May for sluicing and closes about September 1st. This is, therefore, a very short mining season, and the diggings would have to be very rich to be at all remunerative. Such diggings have not yet been found, but the prospects so far obtained are encouraging and will no doubt in a short time lead to a good mining camp being built up. At present there are drawbacks from long-continued high water in creeks, and during a dry season an absence of surface water in the gulches where fair prospects are obtained. The average amount made per man per diem, when working, is from an ounce to $20. Wages are $10 a day; the cost of living about $1.50 a day. There are sufficient supplies in the country in the hands of Messrs. McQuestain and Harper for the number of men there, but not sufficient if a rusb took place. These traders ship their goods from St. Michael's up the Yukon by the Alaska Commercial Company's steamer Arctic, which makes two trips a season to Forty Mile. A small steamer, the Yukon, arrived also with 40 tons shortly before McArthur left. It was also reported that J. J. Healy was coming in with a stock of goods and that he was going to build a small steamer to freight them, but on the 15th of July he had not arrived at St. Michael's and it was generally considered very unlikely that he could build the boat in time and make the trip before winter set in.

In referring to the untrustworthy reports about the country, it is a fact tbat no such sum amounting to $170,000 in placer gold, mined by 17 men during this year, has been shipped to San Francisco. It is also untrue that one man dipped up with a spoon gold nuggets to the amount of $11,000. On the whole there is no new cause for excitement, the prospecting of so large a tract of country by so few a number of poor men is slow and arduous work, but eventually there may be found profitable diggings. In publishing sensational and lying reports, much injury will be done to the country and great hardships will be entailed on those who may rely upon their truthfulness, unless they are well provided with means sufficient to keep them in the country for at least a year. If a rush takes place, as is predicted by Captain Worth, it will most certainly end like many others bave done before, in disappointment and hardships. Miners must therefore be wary in noticing reports, most probably made by selfish and interested persons.

It may be again mentioned that the Government of Canada, like that of the United States, bas utterly neglected tbis region and done nothing wbatever to build roads, trails, or assist the pioneer miners to develop the resources of such a ricb country. Neither has there been any Government representative in the Yukon mines, not even a civil magistrate.

Electic Traction on Highways.

A London dispatcb states that anotber electric omnibus, operated by a secondary battery, has appeared in the streets of that city. It carries 12 inside and 14 outside passengers. Sixty-eight cells are required to drive it, bringing the total weight up to about 7000 pounds. Whatever may be the fate of this particular vehicle, it is reasonable to suppose that but few years will now elapse before self-propelled vehicles will be extensively used on paved streets and highways, especially where the dirt road has been replaced by crushed stone. The steam traction engine is used to a considerable extent in Europe, and is being gradually introduced in America. In California it is encouraged by tbe excessive local freight rates, and tbere, as elsewhere, the improvement of common roads will, of course, basten its more geoeral adoption. There has been some discussion of the probability of the electric railway being introduced for the use of the farmer in hauling his produce to market, and while this plan would no doubt be feasible in certain districts, it is difficult to imagine tbat it would ever become popular if actual casb was to be paid out for transportation. The farmer wbo was deprived of the privilege of hitching up his team and driving a load to market would soon arrive at tbe opinion that life was not wortb living. Whatever may be the coming system of transportation, the movement for better roads is gaining strength throughout the country, and the economic advantage, even with the use of horses, will more than offset the cost nf the improvements. In our thickly settled States, the building of railroads has practically ceased, and instead of bonding towns and cities to encourage competing lines, more attention will naturally be devoted to facilities for reaching such railroads as are already in existence. This may take the form either nf bettering the highways, nr establishing electric railways. This is to-day the most important public issue before the people, the tariff question being a mere political war-cry, in which both great parties purposely exaggerate the facts for the purpose of befogging the voters. The great need nf this country is the devotion of more capital to public improvements nf a permanent character, and New York City has recently shown unusual enterprise in this direction. The completion of the new Croton Aqueduct has been followed by more extended repaving of the streets than has been witnessed since the work was originally done. Every undertaking of this character is valuable as an object lesson. When the fact becomes thoroughly established that good roads are beneficial to all citizens, whether owners of vehicles or not, there will be no faltering in this important line of improvement.

Alloys of Iron and Chromium.

At the last meeting of the British Iron and Steel Association Mr. R. A. Hadfield read a very interesting paper on the alloys of iron and chromium. He began by stating that so far no exact statement had been presented to the institute as to the properties of chromium steel. He then described the results obtained with combinations of iron and chromium. Judging from these results, he thought that it was probable that chromium steel had an important future before it; and that the special question of steel alloys or combinations would be found to possess considerable practical importance to the world at large, and perhaps be the means of eventually enabling engineers to design and carry out works of a magnitude which even at present was not possible. It was to France that we were indebted for most of our information as to the metal, its properties, and tbe development of its use. It was discovered by Vauquelin towards the end of 1797; and no doubt its discoverer would be surprised if he could see that to day we were principally indebted to this metal for the remarkable properties possessed by modern armor-piercing steel projectiles, properties which bad enabled tbose of six-inch caliber to penetrate compound armor-plates 10½ inches in thickness, remaining practically unaltered in form, or those 13 5 inches in diameter fired from the 63-ton breechloading gun to penetrate over three feet of steel and wrought iron. The application of the metal in metallurgy to more peaceful purposes had not yet been extensive, but that is use would increase could not be doubted. It appeared that Faraday and Stodart in 1820 were the first to investigate tbe effect of the addition of chromium to iron and steel, much more exhaustive experiments being made in the following year by Berthier. In 1861 the first commercial application of chromium to iron and steel manufacture was suggested by Robert Mushet; but it was Mr. Julius Baur, of New York, to whom the credit must be given of first introducing on a practical scale tbe manufacture of chromium steel. Mr. Baur took out an American patent in August, 1865, and has followed it up by further patents. Since then his process has been continuously carried out by the Chrome Steel Company, of Brooklyn, which had for 20 years produced chrome steel.

After describing the metal and its compounds and their actions on various substances, Mr. Hadfield gave a resume of early experiments in the addition of chromium to iron and steel. He proceeded to discuss the production of ferro-chromium from chrome iron-ore, a uniform ferro-chromium being the first step in the manufacture of malleable alloys, since the simple addition of chromium to molten iron was out of the question. As regarded the use of chromium as an addition to cast iron there did not seem to be a probability of any large application. It conferred hardness, not per se, but owing to the property it possessed of driving the carbon present into the combined form.

Proceeding witb a description of the results of his experiments, Mr. Hadfield said that the material he used as a basis was good wrought-iron scrap, sbowing small percentages of sulphur and phospborous. To this was added varyiog quantities of ferro-chromium containing six per cent of carbon and 66 per cent of chromium. The manufacture of tbese alloys was not easy owing to the refractory nature of the rich ferro-chromium, and pieces of the ferro-chromium came out of the crucibles unmelted, tbough subjected to several hours of tbe most iotense heat of a Sheffield crucible furnace. If the temperature was allowed to diminish even for a sbort time the contents of the crucible were liable to become solidified. When the melting operation was carefully carried out and the heat properly maintained, the pouring possessed no special difficulty; in fact, the product was as fluid as other alloy steels, but cooled rapidly, much more so than carbon-steel.

The Apparent Growth of Gold.

Of the many myths prevalent regarding gold, the greatest one of all is its growth. Of course there are many interesting instances where ancient worked-out galleries in mines are slowly closing up by the incrustation process, so that space long ago excavated is being filled with an accumulation resulting from the percolation of water througb the adjacent wall-rock. This water has in chemical combination such minerals as iron, copper, sulpbur, and the precious metals, which are deposited in the open crevice, making for a second time a mineralized body which will show by analysis the above named and many more minerals. In fact, I have had this actual experience resultant on tbe examination of an old gold mine in Honduras, Central America, that had been worked some time prior to any history we bave of that country. This circumstance gave to the natives the idea that gold grew, and they so expressed themselves; while it seemed in the case of one individual a transmutation idea had permeated his head, for he explained that the green carbonate of copper was undergoing a change into silver, while the silver in turn would develop into gold.

In India I found a caste nf mining people who believed that gold grew in the bottom of the large lakes situated in that country. They expressed no practical reason other than fairy-tale superstitions. And even in this country there are converts to the idea. I was much amused and interested some years ago to hear an intelligent acquaintance maintain in strong and not altogether religious terms that "the stuff grew and he knew it." His experience was based on the fact that in a certain pile of tailings, resulting from the milling of heavy sulphuretted gold ores, he had treated at one time several tons with no result. Again, in three years time he discovered by a pan-test that the same pile had gold in it, whereupon he treated several tons with the approximate result of nne dollar per ton. After this last treatment he declared the tailings were barren of gold so far as he cnuld detect by the mechanical means at hand. In order to convince him I selected an average sample, which on assay gave 2 pennyweights 20 grains gold per 2000 pound ton. This was considered not worth the working. But my friend maintained that the gold would grow again in two or three years.

True to his word, in two years he was at the pile again, and by his crude but sure method was saving one dollar per too from the ore that would yield *nil* by his methods two years before. Again I took samples for assay and was somewhat surprised to find that the value had increased just 50 per cent, as the result of my determination was 5 pennyweights 16 grains per ton. On investigation, I found the sulphurets to be of a character readily decomposed by the elements; in fact to such an extent that, as I afterwards calculated, over one-half the pile must have been decomposed or washed away, so that with the decomposition a certain rapid concentration was maintained by the action of heavy rains, and the natural advantage this particular ground offered causing the gold to remain behind while the oxides were carried away in suspension by the water. My explanation has failed to convince my friend of the pick and shovel. As the gold in the tailings has become about exhausted, his last attempt to make it pay was a failure. He remains strong in the conviction that a few years will grow it again.—Science.

The New Wet Process.

A London correspondent writing to the Adelaide *Advertiser* in reference to experiments in the treatment of refractory ores from Soutb Australia and elsewhere, reference to which has been made in cablegrams, states that hitherto no system has been successful in extricating the full assay value of the metals contained in complex ores; but two eminent Scotch metallurgists claim to have solved the problem, and the inventors claim that by their process practically all gold, silver, copper and other metals contained in any kind of ore can be extracted with great economy in plant, labor and time, the process being specially applicable to the treatment of copper ore associated with gold and silver, such, for instance, as the ore raised at the Queen Bee mine, which has hitherto been sent out of South Australia for treatment, and also the Reedy Creek gold and copper ore, which has defied all efforts to extract the gold from the pyrites in paying quantity in consequence of its being associated with copper. Ore from this mine, bowever, was particularly amenable to the new process. The full assay value of both gold and copper was readily obtained, as well as a small quantity of silver. The ore tried was concentrated pyrites. Notable features of this new process are that better results are obtained when treating tons than when dealing with small parcels in the laboratory, and that it is more effectual with a low-grade ore containing from 3 to 8 per cent of metal than with ores of a high percentage. A series of experiments with South Australian and other ores has been made under the supervision of Mr. T. A. Masey, F. G. S., who has acquired the Australian rigbts, and arrangements have been made to erect a furnace and plant at the Blinman mine to deal with 50 tons of ore daily. A similar plant to treat the same quantity of ore per day will be erected at the Aclare mine, and when in operation the directors and managers of the Broken Hill mines will be invited to inspect the process at work. Mr. Masey is confident that the process will solve the much-vexed question of the Barrier of treating at a profit low-grade sulphide ores containiog lead, silver and zinc.

The South Australian ores that have been tried by this process are from the following mines: The Blinman, containing copper; Reedy Creek, copper, gold and silver; Queen Bee, gold, silver and copper; and Aclare, zinc, silver and little gold (3¼ dwt). In each case the full assay value of each metal was obtained at a minimum of cost. The actual cost is at present a trade secret, but as tbe chief chemical used is inexpensive, being a by-product from another manufacture, and the process is a quick one, involving comparatively little labor, the total cost will be considerably less than the refining charges exacted by smelters in Australia.

THE cost of a world-wide patent is disclosed by the following incident: Two French gentlemen patented a hypodermic syringe all over the world. This fact arrested the attention of a writer in *Le Figaro*, who at once became curious to know the cost of the operation. It seems there are 64 countries where an invention can claim protection. Sixteen of these, remarks the *Paper Record*, are in Europe, 8 in Africa, 4 in Asia, 27 in America, and 9 iu Oceania. The total value of these 64 official scraps of paper or documents amounted to the sum of $17,000.

Mechanical Progress.

Protecting Iron Tunnel Roofs from Corrosion.

In the last issue of "Transactions of the American Society of Civil Engineers," Mr. James G. Dagron, M. Am. Soc. C. E., describes a method adopted by him of protecting from corrosion iron work used as a covering for tunnels. On the line of railway connecting the Baltimore & Ohio and Philadelphia & Reading railways, in Philadelphia, the headroom in places is not sufficient to permit the use of an arch; and consequently the street above is supported on a buckle-plate flooring carried by transverse iron girders.

Trains have been running through this tunnel since September, 1886, and in the winter of 1890–91 the attention of the author was called to the very serious corrosion of the iron work taking place under the combined action of gas and steam from locomotives. He was instructed to devise some means of arresting this action and proceeded as follows:

The iron work was thoroughly scraped and the girders were given two coats of asphalt paint. Skewback tiles were then placed in position on two continuous girders and a flat arch of hollow fire-brick tiles was put in and each joint thoroughly sealed by cement mortar by a workman who was sent into the space between two transverse girders and the buckle-plates. After sealing the upper sides, a one-inch coat of cement mortar was applied to corrugations left on the under side of the arch for this purpose. The cost of the work, including the painting of the iron work, was $1.40 per lineal foot of arch, or $0.44 per square foot of arch. Omitting the painting, the cost was $0.357 per square foot of arch.

Mr. Dagron says the tunnel is much freer from smoke since the arch was put in, as the girders held the smoke. The buckle-plates, which were galvanized, were not affected by the gas or steam. After four months there is no evidence of cracking in the one-inch cement coating. It is less exposed to variation of temperatures than it would be outside the tunnel. In answer to a query as to why it would not do to apply the cement directly to the iron, it was stated that it would be much more difficult to make it adhere, and the direct heating of the iron in this case would be liable to cause trouble in expansion and contraction of the metal. It is supposed that the corrosive action of the gases also is largely due to the heat. A member said that galvanized iron would not answer as a protection; it had been tried and abandoned on his railroad, and its use for cornices in stations was also discontinued, as they were totally destroyed within two years.

Process of Iron-Ore Separation.

Mr. Henry H. Eames of Baltimore county, Md., has patented a process for the extraction of iron from gangues, ores or sponges in which they exist. The apparatus for the purpose consists of an endless belt or band which has along its surface a series of conducting strips and by means of a series of rollers above and below the band it is made to assume an undulating, corrugated, or serpentine form. This band is placed in an inclined position, so that the ores dropped upon it travel naturally upon an inclined corrugated plane. Means are also provided for imparting to the strips upon the band or passing through it an electric current. Upon this corrugated band the ores or gangues are dropped. The current passing through the conducting strips, crossing the same, causes the particles of iron on the band to attach themselves to the conducting strips. At the same time a stream of water is directed upon the band, which, being inclined, flows in the direction opposite to that in which the band is traveling, washing backwardly the gold, or copper, or other metal composing the gangue or sponge which does not adhere to the metal strips which continue to flow backwardly until washed off of the lower end of the band into a receptacle placed there to catch them. The iron particles continue to adhere to the strips and travel with them to the other end of the apparatus, when the circuit passing through the strips is broken and the iron particles fall off upon the ground, or into a receptacle at that end.

To further describe the process it may be said that the operator may take the gangues, ores or sponges and grind or pulverize them, then pass a current of electricity through a copper wire or other conductor and bring this conductor in proximity to or in contact with the divided material, when the iron particles will attach themselves to the conductor. If the wire be then removed, the particles of iron will still adhere to it and immediately drop off when the current is broken. The same thing may be accomplished by placing the ground gangues in water into which a conductor is introduced, passing an electric current through the conductor, and stirring up the divided material. The particles of iron will adhere to the conductor, which may then be removed from the water, and when the current through the conductor is shut off, the iron will drop therefrom.—American Manufacturer.

Inventors not Mechanics.

It is fortunate that the inventor of a machine is so seldom a good mechanic, for if he were he would never have the courage to attack his problems so boldly. Such an inventor seldom, if ever, does more than to demonstrate in a crude way the possibility to do a certain thing by a new method, or to do by mechanisms what previously had been done by hand. If, then, the inventor tries to manufacture his crudity, he generally fails, for such monstrosities, as a rule, are not manufacturable by the usual methods of modern manufacture at a price that permits of their being sold at a profit. Now, it is just at this point that the trouble begins between stubborn inventors and capitalists whom they have interested in their devices. The mechanics who have been hired to make the machine will complain that the thing cannot be made like the model by tools for divers reasons, one of which generally is because such model is such a ramshackle affair that it cannot be made by tools to duplicate it.

These mechanics will suggest other movements to do the work, but the inventor will object and demand that his contrivance be adhered to. This being done, the cost is found so great that no profit is possible. Then capital will object, and the inventor will insist, and it is only a matter of time when he goes out of the concern, and then the device will be remodeled on mechanical lines. The point to be made here is that after an impractical man has made a thing that demonstrates the possibility of doing a thing that is new and good, let him turn it over to expert mechanics to remodel in good modern mechanical shape, and rest content with showing the world how the thing could be done, permitting others to substitute the more desirable movements to do it. He thus can retain his hold and gain credit, where in the other case he loses all and gets the reputation of being a crank.—Manufacturers' Record.

BRASS CONDENSER TUBES.—Some brass condenser tubes in the U. S. cruiser "Baltimore," after being in service for a year or more, were found to have experienced a peculiar change. In many places the metal was changed to almost pure copper, of a spongy texture, the zinc having completely disappeared. An investigation showed the probable cause of the failure to have been an electrolytic action between the tin-lining of the tubes and the brass, the sea-water circulating through the condenser forming the electrolyte. Had the tin-coating remained perfect, no corrosion would have resulted; but the mud and grit carried in suspension through the condenser cut away the tin-coating in spots, and it was at these spots that the change of the metal occurred. It was concluded that if the tubes had not been tinned at all they would have remained intact.—Engineering News.

TESTING BOILERS.—British marine engineers are again discussing the desirability of agitating for a change in the system of testing boilers, with a view to reducing the thickness and weight of the shells. It is asserted that of late years material and workmanship have so much improved that the hydraulic test at present imposed by the Board of Trade and insurance companies might well be reduced by one-half to 90 pounds over the working pressure, as is now the case with British ships of war. The saving which this would effect may be estimated from the fact that in the new Cunarder "Campania" about 1200 tons of weight are absorbed by the boilers alone.

HORSESHOES OF ALUMINUM.—Aluminum horseshoes have been tried in one of the Finnish cavalry regiments. A number of horses were shod on one fore foot and one hind foot with this metal, ordinary iron shoes being used on the other feet. At the end of six weeks, during which time the animals had been moving on a hard and stony road, it was found that the aluminum shoes had worn rather better than those of iron, and not one of the former had gone to pieces.

Scientific Progress.

Why Is Sea-Water Salt?

This question, says W. M. Williams in *Science*, has been regarded as a mystery and has given rise to some curious speculations, but a little consideration of the subject must, I think, satisfy us all that it would be very wonderful, quite incomprehensible, if the waters of the ocean were otherwise than salt as they are.

The following explanation was first suggested to myself many years ago when receiving my first lessons in practical chemical analysis. The problem then to be solved was the separation of the bases dissolved in water by precipitating them, one by one, in a solid condition; filtering away the water from the first, then from this filtrate precipitating the second, and so on, until all were separated or accounted for.

But in doing this there was one base that was always left to the last, on account of the difficulty of combining it with any acid that would make a solid compound, a difficulty so great that its presence was determined by a different method. This base is soda, the predominating base of sea-salt, where it is combined with hydrochloric acid. Not only is soda the most soluble of all the mineral bases, but the mineral acid with which it is combined forms a remarkably soluble series of salts, the chlorides. Thus the primary fact concerning the salinity of sea-water is that it has selected from among the stable chemical elements the two which form the most soluble compounds. Among the earthy bases is one which is exceptionally soluble,—that is, magnesia,—and this stands next to soda in its abundance in sea-water.

Modern research has shown that the ocean contains in solution nearly every element that exists upon the earth, and that these elements exist in the water in proportions nearly corresponding to the mean solubility of their various compounds. Thus gold and silver and most of the other heavy metals are found to exist there. Sonnenstadt found about 14 grains of gold to the ton of sea-water, or a dollar's worth in less than two tons.

As the ocean covers all the lower valleys of the earth, it receives all the drainage from the whole of the exposed land. This drainage is the rain-water that has fallen upon this exposed surface, has flowed down its superficial slopes, or has sunk into porous land and descended underground. In either case the water must dissolve and carry with it any soluble matter that it meets, the quantity of solid matter which is thus appropriated being proportionate to its solubility and the extent of its exposure to the solvent. Rain when it falls upon the earth is distilled water nearly pure (its small impurities being what it obtains from the air), but river-water when it reaches the ocean contains measurable quantities of dissolved mineral and vegetable matter. These small contributions are ever pouring in and ever accumulating. This continual addition of dissolved mineral salts without any corresponding abstraction by evaporation has been going on ever since the surface of the earth has consisted of land and water.

An examination of the composition of other bodies of water, which, like the ocean, receive rivers and rivulets and have no other outlet than that afforded by evaporation, confirms this view. All of these are more or less saline, many of them more so than the ocean itself. On the great Tableland of Asia, "the roof of the world," there is a multitude of small lakes which receive the waters of the rivers and rivulets of that region and have no outlet to the ocean. On a map they appear like bags with a string attached, the bag being the lake and the string the river. All these lakes are saline, many of them excessively so, simply because they are ever receiving river-water of slight salinity and ever giving off vapor which has no salinity at all. There is no wash through these lakes as in the great American lakes, or those of Constance, Geneva, etc.

The Sea of Aral and the Caspian are lakes without any other outlet than evaporation, and they are saline accordingly. The Dead sea, which receives the Jordan at one end and a multitude of minor rivers and rivulets at its other end and sides, is a noted example of extreme salinity. It is, as everybody knows, a sea or lake of brine. The total area of land draining into the great ocean does not exceed one-fourth of its own area, while the Dead sea receives the drainage and soluble matter of an area above 20 times greater than its own, and thus it fulfills the demand of the above-stated theory by having far greater salinity than has the great ocean.

According to this view the salinity of the ocean must be steadily though very slowly increasing, and there must be slowly proceeding a corresponding adaptation or evolution among its inhabitants, both animal and vegetable. The study of this subject and the effect which the increasing salinity of the past must have had upon the progressive modifications of organic life displayed by fossils is, I think, worthy of more attention than it has heretofore received from paleontologists.

OYSTERS AND MUSSELS AS WATER FILTERS.—It has been observed that sea water, which always holds solid particles in suspension, becomes clear with surprising rapidity when an oyster or a muscle is placed in a vessel that contains it. These animals, in fact, as soon as they are immersed in their natural element, establish a rapid current of water between their separated valves. Of the particles that such current carries along, some are agglutinated into large lumps by a mucous secretion of the mantel and then immediately rejected, while others traverse the digestive tube, to be afterward expelled in the form of solid excrement. It results that, after the lapse of a very short time, the mollusk has filtered the surrounding water, but the amount of filtered water is not the same with all oysters and mussels. The researches of Mr. H. Vaillanes show, in fact, that mussels, in the same period of time, filter three times as much as the French oyster, and the Portuguese oyster filters five and a half times as much. From the standpoint of oyster culture, these results explain the cause of that dying off of oysters that culturists have been complaining of for some years, and indicate the remedy for it; that is, the suppression of the mussels and the proscription of the Portuguese oysters from the parks in which the French oysters develop. Mr. Vaillanes' researches permit also of comprehending the importance of the role that these mollusks have played and are still playing in the economy of the seas and the building up of the continents. These animals, which endure changes of saltness better than others, constitute colonies that are often immense and elevated as barriers at the confines of marine and fluvial waters. They are powerful filters charged with freeing the latter of the solid materials that they are carrying to the ocean.—Scientific American.

COMPRESSION OF TIMBER.—The compression of timber is becoming a growing industry, and the material thus treated is being applied to a variety of useful and ornamental purposes, especially in the field of carving, most attractive and artistic designs being thus brought out, pronounced in many cases fully equal, if not superior, to anything ordinarily produced in that line. The wood to be employed in this manner, says the *Age of Steel*, is compressed either in its natural condition, or after being steamed, and it is found that the hardest, well-seasoned ash timber, say of four inches thickness, can be pressed into about three inches without injuring the fiber. Moreover, it is also found that wood can be "upset" the same as iron; and the increased tenacity of bent and compressed wood of this sort, as compared with the same in its natural state, is declared to be something surprising. In mechanical operations, compression is now applied to spoke tenons, the work being described as very simple and rapid, the tenon properly tapered and ready to drive to its place, an increased strength being thus added to the wheel equal to three additional spokes.

WE remember seeing some experiments described, in which an attempt was made to determine the color that first exhibits itself in the transition from blackness to redness, as the temperature of a bar of (say) iron is raised. The experiments were, of course, carried out in a perfectly dark room. But there was considerable discrepancy between the results according to different observers. It would be interesting to know what photography would have to say upon the subject; plates specially sensitized for various regions in the ultra-red being employed. Would glow lamps heated electrically to dull redness, or a kind of thin metal extinguisher similarly heated by a Bunsen burner, give light sufficiently nonactintic for ordinary use in the photographic dark room?

COPYING PAPER has lately been prepared in such a manner that there is no necessity to moisten the sheet before taking an impression of the manuscript. This is done, says a contemporary, by moistening the sheets in a solution of a deliquescent salt, and once prepared in this manner the sheet is always ready for use. A French scientific journal recommends a solution of one-tenth part of chloride of magnesium or one-twentieth part of calcined chloride of lime.

DUNCAN'S

Practical Surveyor's Guide.

A New, Enlarged and Revised Edition.

JUST READY.

The Practical Surveyor's Guide, containing the necessary information to make any person of common capacity a finished land surveyor, without the aid of a teacher. By ANDREW DUNCAN, Land Surveyor and Civil Engineer. A new, revised and greatly enlarged edition. Illustrated by 72 engravings.

In One Volume, 12mo., 214 pages, price $1 50. By mail, free of postage to any address in the world.

PREFACE TO REVISED EDITION.—As shown by the constant demand for it, "The Practical Surveyor's Guide" still maintains the popularity and reputation it has, for so many years, enjoyed. The issue of a new edition having become necessary, a considerable amount of new matter has been added in order to make the work still more useful to the reader. No changes, except necessary corrections, have been made in the original text. The greater portion of the new matter has been translated from "Katechismus der Feldmesskunst," by Dr. C. Pletsch, a very popular German work which has passed through five editions. In making these additions, the aim of the author of the original work—to prepare a work sufficiently concise and instructive in the several details—has been constantly kept in view. It is hoped that this new edition may prove of value to surveyors, professional and unprofessional, in giving them the needed information in a clear and simple manner, unburdened with unnecessary matter.

ABSTRACT OF CONTENTS.—Introduction; Object of Surveying; What a Survey Should Include; Definition of Points; Determination of a Straight line and of a Plane Surface; Map of a Survey; Scales According to Which Maps of Surveys are Drawn; Instruments for Measuring Distances and Their Use; Instruments for Setting out Right Angles, and Their Use; Survey of Smaller Tracts with the Assistance of the Previously-Described Instruments; Problems; Trigonometrical Surveying; Tables of Surveys; Systems of Rectangular Surveying for Surveying the Public Lands of the United States; Index.

WE HAVE ALSO RECENTLY PUBLISHED

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S Osborn, LL D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages.

Price $1 50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron, X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo. 367 pages.

Price $4.50, by mail, free of postage to any address in the world.

Electricity.

The Electrical Habits of Iron.

It is strange, says *Industries*, how little is known about the loss of power in iron under reversals of magnetization. It has been known for many years that energy was lost when iron was magnetized and demagnetized, but the builders of dynamos had no clear ideas on the subject. Seven years ago Prof. Ewing and Dr. Hopkinson called attention to the loss of energy by hysteresis, apart from Foucault currents; but since then no information of any practical importance has been added. It seems as if everything connected with alternating currents is doomed to go through a period of harren quasi-scientific treatment before being studied and utilized by electrical engineers. The quasi-scientific method of treating iron is to take curves with a ballistic galvanometer. This is a cumbrous method, and does not give the information required. The engineer really wants to know what kind of iron gives least loss hy hysteresis, what maximum induction does it pay best to employ, and how much energy is wasted per cubic centimeter per cycle. To test a given sample, the obvious way is to make a little choking coil of it, and to measure the power lost by means of a wattmeter. This gives the information at once as regards the sample. If readings are taken at different electromotive forces, the losses at different inductions are obtained. The ballistic galvanometer method is merely an indirect and perhaps inaccurate way of arriving at the same result. Finding the qualities of different samples is a very small matter. The chief difficulty is to find good qualities of iron at reasonable prices, and what is wanted is the knowledge of the causes that go to make iron and mild steel good or bad. Makers of iron do not generally know anything about hysteresis, and electricians know little ahout iron, hut it is no use shirking the subject and reading papers to scientific societies ahout curves belonging to specimens obtained at random from unknown sources. Reams of paper have been covered with researches on curves of random samples, and they are absolutely useless. They may he of scientific interest; if so, well and good, but they are generally supposed to be for the benefit of the benighted and ungrateful practical man. So far, all the information the dynamo-maker has is that soft iron has comparatively little loss by hysteresis, and he pins his faith on some particular merchant who supplies him with a metal which he calls "best Swedish charcoal iron," but which is not generally labeled "Made in Sweden."

A few investigators have given the analyses of their samples, but we do not know whether the percentage of carbon is the salient quality, or whether minute traces of other suhstances increase or decrease the loss of power. Neither do we know how the treatment of the iron in rolling and annealing affects the magnetic properties. If investigators could only be induced to consider what practical people want to know, instead of what "looks deep in print," some useful information might be obtained.

An Idaho Electrical Transmission Project.

A company has been formed under the laws of the State of Illinois to utilize by electricity the power of the Shoshone Falls in the Snake river, Idaho. It is stated that the amount of available waterpower at these cataracts is second only to that of Niagara, and that it is constant all the year round. The principal fall is 950 feet wide and 210 feet high, although a second fall increases the total head to 290 feet. The newly-incorporated Shoshone Falls Electric Power and Irrigation Co., which is capitalized at $25,000,000, has secured control of both sides of the river at the falls, and proposes to erect a great plant for the generation of electric-power. The conformation of the banks of the river lends itself very readily to the scheme, and no tunneling will be necessary. Large power units will be employed, hut the details of the plant are still to he worked out. The Snake river flows through a canyon of considerable height, and this fact has heretofore prevented the use of the water for irrigating the surrounding valley, the soil of which is extremely fertile.

It is now proposed to carry the current along the river from the generating stations at the falls to points where the canyon-walls are lowest. Here, by pumping 40 feet, the water can he raised to the land ahove, where it is needed. Electric pumping-stations will he installed at these points, and the water will be raised into irrigating canals and sold to farmers. The rates now prevailing for irrigation are from $15 to $40 for hringing the water on the land, and then an annual rental of $2 or $3 per acre. It is estimated that, under the conditions existing, the expenditure of 5500-horse power will irrigate 120,000 acres of land. It is the intention to ultimately transmit power and light to the Wood River mining country also. The incorporators of the company are Nelson W. Perry, H. C. Baker and John B. Schmalz. Mr. Perry, who will have entire charge of the designing and construction of the plant, is peculiarly fitted for the work, as, in addition to a complete equipment as a mining engineer, he has a thorough knowledge of the applications of electricity. He was formerly editor of *Electricity*, New York, and is well-known to the electrical fraternity of Chicago, Cincinnati and New York. Ground will be broken for the works at the falls within 30 days.—Western Electrician.

Utilizing Earth Currents.

It has often been found that a formidable enemy when properly harnessed may become as formidable a friend and can then he made quite useful. While this has been done in a number of cases, it does not follow that this can always be accomplished. In an article published in this issue the author makes the ingenious suggestion that the earth currents, which are such a nuisance to telegraphers, might possibly be put to some use. While this would be desirable it is hardly likely that it will ever amount to much except as a mere matter of interest, for a number of reasons. In the first place the more frequent weak currents are too feeble to be of much use except possibly in a number of very limited cases for telegraphic purposes, but even then they are too unreliable and variahle, and the only saving would he in hatteries, which after all is not a matter of great importance. The strong currents are hy far too erratic to be of any use; besides, they seem to occur only every 11 years, and it would hardly be worth while to have any apparatus lie idle for 10 years to be used only during a portion of every eleventh year. While the voltage of some of these earth currents appears to be quite high, reaching 600 to 700 volts, it must not be forgotten that this is only between two points separated by a considerable distance. In the number of cases cited there would not be more than about one to one and a half volts per mile, and it would not be practicable to huild a line to utilize such a voltage for power or lighting purposes. Another thing is to be considered. This difference of potential in different parts of the earth is more of the nature of a charge in a condenser, which will no longer exist when the cause is removed and the two parts are connected by a wire. The only current that would be generated is during a charge and discharge. It is therefore not in the nature of a continuous source of electromotive force, as in the hattery or a dynamo, which is continually regenerated. Furthermore, a line wire does not, in that case, act as a return circuit for the earth, but the two are in multiple and the only current in the line would be its share when considered as a shunt to the earth. An electric storm, as at present understood, would treat the line wire as if it were merely a good conductor forming part of the earth; a hare wire, for instance, huried in the earth would prohably show about the same current as if it were overhead. While the suggestion of the author is an ingenious one, we think it is like others of a similar nature, as for instance the utilizing of the tides, on which inventors have spent more time than the possible results would warrant, and we would not wish, therefore, to encourage inventors to give much thought to a possihle commercial use of earth currents.—Electrical World.

THE longest electric railway in the world is reported to be contemplated in Russia. The project is to construct a line from St. Petersburg to Archangel, a port on the White sea, a distance of more than 720 kilometers (450 miles). The electro-motive power is proposed to be furnished by a series of generating stations, distributed along the line.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES.
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints
DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

Useful Information.

Electricity and the Farmer.

The November number of the *Engineering Magazine* contains an interesting article by William Nelson Black, discussing the influences the electric motor is likely to exert in rendering farm life more agreeable. Mr. Black's views coincide perfectly with those defined in the *Electrical Review* for November 7, 1891, under the caption of "Electricity as a Reformer." The *Review* says:

We believe be correctly attributes the dissatisfaction with farm life and farming pursuits, and the large influx of population from country districts to the cities, to the comparative hardships and discomforts of country life instead of to the alleged gregarious tendency of the human family. When life in the country is attended with comfort and convenience, it will be preferred by a large proportion of the public to city life. Mr. Black thinks tbe electric motor will insure such a condition by enabling the farmer to readily market his produce; that it is not unreasonable to expect the electric railway to cover every township with a network which will permit free intercourse of all tbe residents, and that the opportunities thus opened for rapid transit of country-folks to and from the town, and easy communication *inter sese*, will make country life not only tolerable, but preferable to city life. The article only faintly touches a side of the subject which will be a more potent factor in the creation of this new social status. When electric railways cover the townships from end to end, every farm and every dwelling-house may be supplied witb power—a result which will transform the drudgery, which is now lts chief incident, into easy work; the plows and harrows, the reapers and mowers, will be pushed over their difficult paths by an easily-controlled electric motor; the churns and other domestic paraphernalia will spin merrily under the same influence, and tbe drowsy petroleum lamp which makes hideous a night in the country will give way to the incandescent lamp, and the evenings will become periods of brightness and pleasure.

The electric motor will do still more; it will furnish cheap power to the individual consumer, and, by permitting manufacturing to be conveniently performed in small plants, will diversify industry. It will prove a counter-irritant against trusts, and permit a clever mechanic to produce at home what now must be made in expensive plants, requiring a heavy capital for their maintenance. There will thus be opened wide the doors of competition, and the general public as well as the individual will prove the beneficiary. We may reasonably expect that the next decade will find the results herein referred to accomplished facts, at least to a considerable degree. A reaction in favor of the country districts is needed; the atmosphere of city life is unsuitable for the development of rugged manhood. The nation will gain vigor by a more uniform distribution of its citizens. During the last decade the flow of migration has been strongly toward the city; electricity will produce a change of tide.

The Flow of Water in Pipes.

Many formulæ have been devised by various engineers for expressing the relation between the velocity of flow in a pipe and the head required to produce it. Unfortunately all of them are complicated, and cannot be used for mental calculation or in making rapid approximations. It may be noted, however, that in a vast majority of cases arising in practice, the velocity of flow lies between two feet and four feet per second, and on an average is three feet per second. The head required to maintain tbis latter velocity through a length of clean cast-iron pipe is then

$$\text{Head in feet} = \frac{\text{Length of pipe in feet.}}{25 \times \text{diameter of pipe in inches}}$$

And the discharge in cubic feet per minute is very nearly equal to the square of the diameter of the pipe in inches, the error being under two per cent in excess. Both these calculations are easily performed mentally. For a velocity of one foot per second less than three feet per second tbe head must be reduced one-half and by a proportionate amount for intermediate cases. For a velocity of one foot per second more than three feet per second the head must be increased by seven-tenths times that required for a three-foot velocity, and that required for intermediate cases can again be determined by addlng a proportionate amount for that required for the one foot increase. In this way tbe head required to maintaln through a clean cast-iron pipe a velocity of not less than two feet a second, nor more than four feet a second, which are the limits usually adopted in practice, can be determined mentally with an accuracy sufficient for 99 per cent of the cases tbat arise in an engineer's practice. Having the discharge at a velocity of three feet per second it is of course easy to obtain the discharge at any any other velocity.—London Engineering.

THE INVENTION OF THE TELESCOPE.—The *Optician* says: Galileo is so popularly credited with the invention of the telescope tbat a few actual historical facts on the subject will not be out of place in these columns. The real inventor of the instrument was, without doubt, John Lippershey, a spectacle-maker at Middleburg, Holland; although, according to Descartes, the inventor was Adrian Metius, who wrote on October 17th, 1608, to the Government of Holland, stating that he as well as John Lippershey, was engaged in manufacturing the instrument "that brings distant objects near." Another document, however, of October 2d, 1608, recently found in the Government archives, is the petition from Lippershey praying for a 30 years' patent on his invention. This was refused him because the instrument could not be used with both eyes at once, and after he had made a binocular telescope the patent was again refused because telescopes were then being made everywhere. But, as a partial compensation for bis disappointment, he received an order to construct for the Government two binocular instruments, the lenses of which should be of rock crystal and for which he was to be paid 900 guilders, or about £60 apiece. There is no doubt, however, that Galileo first applied the telescope to astronomical purposes. But he constructed his instrument after he had learned from the invention of Lippershey that a combination of convex and concave lenses possessed the property of making distant objects appear nearer.

Weights of Lumber.

The Chicago *Timberman* issues a Vest-Pocket Inspection Book that contains the following. The estimates made are all based on the weight of 1000 feet of the lumber:

White oak	3,863
Red oak	3,396
Black walnut	3,176
White walnut	2,121
Cherry	3,023
Ash	3,400
Black birch	3,131
Beech	3,741
Yellow poplar	2,197
Maple	3,783
Hickory	4,349
White ash	3,000
Whitewood	2,19
Basswood	2,350
Rock elm	3 6 3
Norway pine	3,521
White pine, dry, rough	2,900
Yellow pine, short leaf	2,826
Yellow pine, long leaf	3,800
Cypress	2,300
Redwood	2,185
Gum	3,070
Dry lath	500
Cedar shingles	2 10
Pine shingles	240
Norway 6-inch fencing	2,900
White pine fencing	2,500
White pine ⅝ ceiling	1,200
Piece stuff, pine	2,500
Norway pine, ⅞ floor	2,200
White pine, ⅞ floor	1,8 10
⅝ ceiling	775
Fence siding	800

NOTICE OF ASSESSMENT.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 22d day of Novembsr 1892, an assessment (No. 70) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessement shall remain unpaid on the TWENTY-EIGHTH DAY OF DECEMBER, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of January, 1893, to pay the delinquent assessment, together with costs of advertising and expense of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

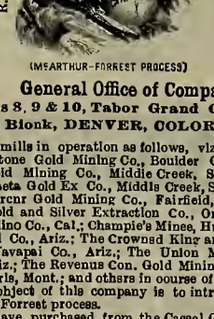
Mines Revived and Miners Enriched
By the wonderful MacArthur-Forrest Process, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r, and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.
DENVER WORKS: On the D. & R. G. R.R. near the Broadway Electric R. R. Depot.
TRADE MARK.


(MACARTHUR-FORREST PROCESS)
GLASGOW WORKS The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.
General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.
Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; Champie's Mines, Humbug District, Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.
The object of this company is to introduce the Mac Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.
If you desire an experimental test communicate with the secretary.
If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.
We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.
The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tuhs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.
The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.
The most desirable class of ores for this process are the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.
We will be pleased to answer any inquiries and furnish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

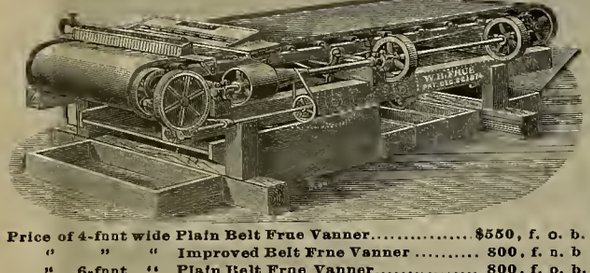
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR,
No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

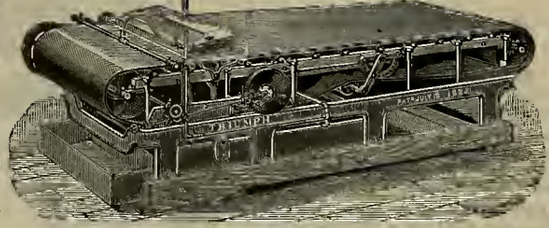
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coln if used he. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Trinmph" Concentrator and "Blasdel" (riffled) Belt are protected hy incontestable letters patent, granted hy the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr.,

Signed] Sup't North Star and Original Empire Mining Co.

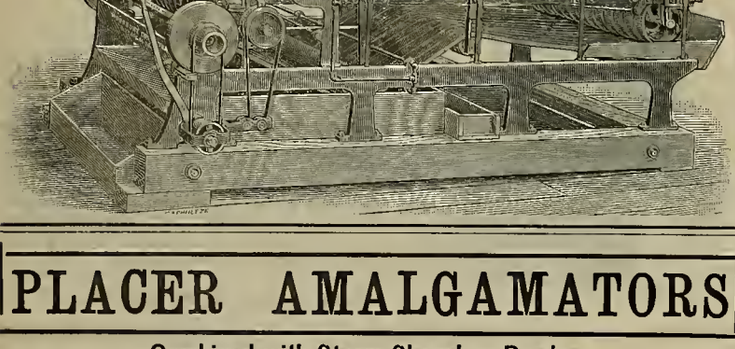
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $675. f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. OJAICO, Oct. 30 1891.

GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.

OAJALCO, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully S. HARRIS.

PATENTED Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

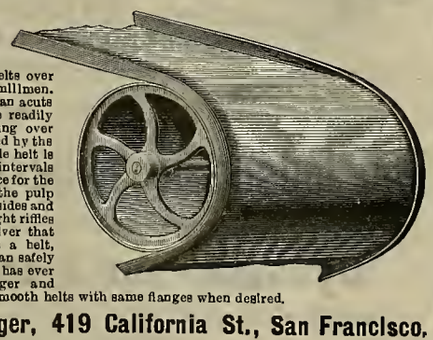
—BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

TO WORK AN OLD MINE.—Amador *Dispatch*, Nov. 26: J. W. Marshal is reopening the Marklee mine, four miles above Volcano. He is now clearing out and timbering the shaft preparatory to working the mine on an extensive scale. The rock looks fine, and the prospects generally are flattering. There are four ledges, and one of them is over 40 feet wide, while the others are from 4 to 5 feet. The mine was worked some 20 years ago, and the ore proved very rich. There is a good mill on the property. J. W. Marshal and N. V. Hatch, of Sacramento, are the owners of the mine. A large amount of ore is on the dump, estimated at 50,000 tons, which, it is thought, will yield per ton from $5 upward.

ZEILE.—*Ledger*, Nov. 26: At this mine extensive repairing is in progress. The old pipe that supplies the mill is to be taken out and replaced with new. It is nearly half a mile long. The pipe was made in San Francisco, at the Risdon Iron Works, and the first load arrived last week. The mill is also undergoing repairs.

CLINTON CONSOLIDATED.—An assessment of five cents per share has been levied by this company—the first levy since the company's organization. There are 100,000 shares, so that, assuming that all the stock has been placed, the assessment will yield $5000. At the mine, matters have been moving along rather slowly of late. The mill is now running, after several weeks' idleness, necessitated, it is said, by lack of water. The men were paid for one month's wages this week, on account. J. B. Francis, the superintendent, and W. J. Nettle, the foreman, have left the company's employ, and rumor says they will accept positions at the Volunteer. A gentleman named Rogers, from San Francisco, has taken charge as superintendent of the Clinton Con.

KENNEDY.—This mine—the richest in the State—is looking better than ever before. The ore in sight is said to be sufficient to run the mill for three years at least. The mine is developing mainly in a northerly direction, which is also an encouraging circumstance, as the ground embraced in the claim is mostly north of the shafts. We may expect, if the developments north continue flattering, that some steps will be taken to reopen the old Oceida, which is the adjoining claim on the north, and which has never been prospected toward its southern boundary.

MISCELLANEOUS.—At the Tripp mine, on the Mokelumne river, above Big Bar bridge, some fine-looking quartz is being taken from the lower tunnel. Ore is also being extracted from the upper tunnel, where the $8000 pocket was discovered two or three years back. It is hoped to start crushing shortly. Operations on a small scale are in progress at the Volunteer. Two or three men are at work repairing the shaft, the timbers of which are found to be utterly worthless. Messrs. Emery and Doble, who are heavy stockholders in the Blue Lakes Water Co., are reported to have purchased a controlling interest in the Keystone Consolidated mine of Amador City. There are 10,000 shares in the corporation, and the new owners are said to have secured the McDonald interest, or four-fifths of the property. The mine is expected to run as usual. Indeed, the owners in the ditch company are in a better position to run it at a profit than the old company, on account of owning the water supply. Six men are at work on the Astoria, near Middle Bar, running a prospecting tunnel. Rumor has it that there is considerable in the treasury—$10,000—with which to do prospecting. By the judicious expenditure of that amount, it is hoped to make a good showing as to the value of the property. At any rate, we are glad to note the inauguration of mining in earnest in the group of mines owned by a syndicate in New York and San Francisco. It is only by active mining that this county expects to be benefited; the mere dabbling in stocks in New York counts for nothing to the people of Amador.

Calaveras.

MURPHYS.—Calaveras *Citizen*, Nov. 26: Mining interests everywhere around Murphys are looking splendidly. The Beatrice is developing work in a thorough and workmanlike manner, and it will not be many days before the splendid new mill upon San Domingo will be running in full blast. The ore taken from the several tunnels looks well and is profuse in mineral, which, if it can be properly worked, will undoubtedly prove a great enterprise. The company intends, and in fact already has upon the ground an electric dynamo which will be used in the reduction and working of the ores. From this dynamo will also be run wires, which will furnish 15 electric lights that will be distributed in the lighting-up of the mill, office and building around the mine. All in all, this plant will be one of the best in the county. The Norfolk mine, east of town, is starting up under more extensive systems, and it is reported they are now upon the great river channel of the place that is immensely rich wherever it is found in this section. An inquiry into the proceedings of the mine will be made, and a more thorough explanation of its workings will be given to you readers before long. Mr. Morse, the able superintendent of the plant and mine, is an enthusiastic worker, and by his indomitable will and push has done much toward developing not one, but many of the mines in and around Murphys.

Inyo.

CERRO GORDO.—Inyo *Independent*, Nov. 24: W. Crapo is reported to have struck a promising body of silver-lead ore in his mine at Cerro Gordo. The ore was reached but a few days ago, and the extent of the body is not yet known. Mr. Crapo has worked a long time to reach this ore, and deserves that his faith and patience should be richly rewarded.

San Bernardino.

TIN.—*Chronicle*, Dec. 1: The stockholders of the San Jacinto Tin Mine Co. have voted to increase the capital stock to £550,000, the new issue being 200,000 shares at 5 shillings each. The expert, Mr. Yarcoe, made a lengthy report, upon which the foregoing action was taken, and in which were the following statements: "The vein has not been lost, only the workers have reached the bottom of the deposit of ore. The lode in which the tin is found is a true fissure vein, and, according to all experience, there is no reason a second deposit of tin should not be found in depth—indeed, I think it will, but as the mine stands at present there is very little ore in sight. The formation is the same as in other places where the deposits have been found. I should think another 20 fathoms would prove the mine, but there is no absolute rule. About £10,000 would be sufficient for sinking and driving. I should drive westerly for choice, because I think most of the ground in that direction, but I should also drive easterly. I have no fault to find with the quality of the tin. I had no previous connection with the mine and was there about ten days. You cannot test a vertical vein satisfactorily with a drill. You may be near a large quantity of tin and yet miss it. I would propose to drive 150 fathoms and sink 120 feet."

Shasta.

BUNKER HILL.—Shasta *Courier*, Nov. 26: The Bunker Hill mine, situated two miles southeast of Shasta and just north of the Middle Creek depot, and owned by Mrs. James Long, now residing in New York City, John V. Scott and Daniel Lynch, of this place, and Mrs. Carmichael, a daughter of the late D. D. Harrill, has changed hands, W. A. Prior agent for Mrs. Long, having consummated all necessary negotiations, and this week the property was transferred to Wm. M. Murray and others. The ground has not been worked for over 20 years, with the exception of some little prospecting. The parties who have now taken hold of the property intend to work it on an extensive scale, and are confident of opening it out as extensively and rich as it had proved in former years. The balance of the claims on the adjoining 40 acres of the patented ground are owned by Mrs. P. Pryor, Mrs. John Hoy, Robt. Kennedy, Wm. Daniel, Peter Cusick and others.

NOTES.—It is reported that another rich strike was made in the Cleveland mine on Salt creek this week. A new roaster has recently been completed at the South Fork reduction works, and we understand that operations will be begun there about the 8th of next month. Parties below are negotiating with James Dawe for the purchase of his mining property near Shasta. The ledge is a good one, and shows up rich in gold and sulphurets, and would prove a bonanza to some man who had capital to work it. It is rumored that a very rich strike has been made in the Bunker Hill mine, recently sold to Wm. Murray and others. Such a thing would not be surprising, for few if any mining localities in the State ever paid as rich as Bunker Hill did in its palmy days, when every panful of pay dirt contained a small fortune. The mine has been tied up by litigation part of the time, but the indications are now favorable for a general reopening and working of the Hill. Though the property was transferred to parties here, we understand that a company of foreign capitalists will take the mine and work it on an extensive scale. The McDaniel mine, between Salt creek and Lower springs, which was recently sold to S. H. Stewart, of Redding, and a couple of other parties, is panning out big. The ledge is two feet wide and some rich ore is being taken out. M. Simoni, of the Gem mine, is in about 175 feet on the tunnel he is running from the bed of Middle creek. He proposes to run into the hill 800 feet.

Sierra.

GOLD BLUFF QUARTZ MINE.—*Mt. Messenger*, Nov. 26: In a recent issue we mentioned that Wm. Kraft, superintendent of the Gold Bluff quartz mine, had returned from San Francisco, where he contracted for the iron work and machinery for a 20-stamp mill with all the most approved facilities for reducing quartz and saving gold, to be erected at the mine. It is clearly evident that the Gold Bluff Mining Co. has begun work in earnest. The Gold Bluff mine is a good one and the general belief is that Mr. Kraft will make it a profitable enterprise. The Gold Bluff Mining Co. is composed of New York capitalists and mining men. We are authorized by Mr. Kraft to state that all his business transactions will be conducted strictly on a cash basis.

FOREST CITY.—Twenty-five men are working at the Bald Mt. Extension drift mine. The main tunnel, from the mouth of the face northeast, is 6600 feet; to the face south, 6100 feet. Only a day shift is being worked, which has been proved most advantageous for profitable working of the mine. On completion of the incline down south, the working force will be increased. Winter supplies have been laid in and everything is in good order for winter.

GOLD BLUFF.—*Mt. Messenger*, Nov. 18: Oscar Stroud is hauling lumber from Shaugnessy's, and Put Carter from Cole & King's mills for the Gold Bluff mill. We understand that Benj. Pauly has a contract for some 36,000 feet. In a few days carpenters will be at work putting in a four-foot flume for power and laying the foundation for the mill.

WILLIAM TELL.—The tunnel in the William Tell mine, near Sierra City, reached the ledge last week. There is a heavy body of quartz with smooth walls. The tunnel taps the vein some distance west of the pay chute. Rock from the tunnel above paid $12.50 a ton. This lower tunnel gives about 560 feet of ledge above it.

Siskiyou.

GOLD.—Yreka *Journal*, Nov. 30: Another rich discovery has been added to the recent gold finds of Siskiyou. Frank Hall, a young mining engineer of San Francisco, who has been operating on Scott river, below Quartz valley, in search of the ancient deep river bed, bottomed the channel a few days ago. Very rich gravel was discovered, and the bedrock found to be exceedingly rich. Many have believed in the existence of a pay channel in Scott river, and this discovery will induce others to prospect for the channel farther down the stream, where many good-paying drift mines will undoubtedly be found. The Ashland *Record* says Joe Weininger was at that place last week from Rummell Bros.' claim at Klamath river, near Henley, in this county, and reported the boys working on the last pit. Several blasts were made to loosen up the dirt, which was so rich that gold could be seen in the gravel at night with lights. After this pit is worked they will immediately commence the construction of a new wing-dam if the high water does not prevent. Schroeder & Werner of the Deadwood quartz mine, intend shutting down the mill in a few days more, on account of snow rendering surface work difficult. They will still continue to take out quartz from the tunnel, so as to have a large supply on hand to run the mill day and night when spring opens. This claim continues to pay well, and is one of the most valuable mines on the coast. The miners in the high gulch diggings will be enabled to do some mining from now on, whenever the weather is not too cold or stormy, as there is snow enough on the mountain summits to supply plenty of water during the warm portion of the day, or when a warm rain occurs.

Trinity.

THE NEW RIVER MINES.—Blue Lake *Advocate*, Nov. 18: George W. Gabeler, who has charge of Mr. Brizard's store at Francis, reached Blue Lake Friday evening of last week on his way to the bay. Mr. Gabeler brought with him some specimens of copper ore taken from what is known as the Lewis ledge. This ledge is situated on the east fork of New river, eight miles from Francis and ten from New River camp. The specimens shown us are said to assay, of gold per ton, $10 and of silver $20, and to be 23 per cent copper. Mr. Gabeler owns an interest in the mine and feels he ought to be glad of it. The serious obstacle in the working of the claim is the outlay of money that would be involved. A smelter would be a necessity, and other items of expense nowise inconsiderable might be enumerated. New River camp is quiet—very quiet. About 50 men are there, and the Sherwood mine is the only claim that is running, but this is paying very well. What ore is taken from the Sherwood is rich, yet the ledge is small, being usually from 7 to 14 inches in width, though sometimes it grows much narrower and occasionally becomes so small as to reach the vanishing-point. The Colgrove and the Mountain Boomer mines have been running. Not a little mining has been done this fall in the bed of New river, and the results have been in the highest degree satisfactory. Of course the ground had been worked over before, but occasional slides into the stream seem to have made the gravel of the river rich in fine gold. An unwelcome rainstorm three weeks ago, that swelled New river and took away the wingdams, put a veto on further operations this year, but it is expected that work will be resumed in the spring. The miners are kicking themselves for their stupidity in not discovering long ago what a good thing there is in the New river gravel beds. Then there is Pony creek. Considerable attention will be hereafter paid to gravel-mining on that stream. Six claims have been taken up by as many mining men, who have everything in readiness for commencement of work. Only water is lacking, it seems, to fill their pockets with gold and their hearts with joy. All the Pony creek gold is in the shape of nuggets. Numbers of them have been taken out that contained $10, $15, $20 and $25 in gold respectively, and one nugget was worth $65. Mr. Gabeler tells us that it is rather lonesome at the store, but some parties from Eel River valley expect to do considerable mining this coming season on the bar only a few rods away, so he expects matters to assume a more lively aspect in his immediate vicinity. New River camp has already been treated to its first snowstorm.

Tuolumne.

MINES AT QUARTZ MOUNTAIN.—Sonora *Democrat*, Nov. 26: Mining properties around Quartz Mountain are looking exceedingly well. We are informed that the Jumper mine is about to be bonded to San Francisco capitalists. The mine is owned by R. B. Cornwall and Edward Fischer of San Francisco, and is believed to be a valuable property. The Golden Rule mine, situated near the Jumper, is being worked by Oakdale parties and is looking very promising. The App and Heslep mines are being relieved of water, preparatory to the commencement of active operations. These mines are bonded to Napa parties, and their value has long since been demonstrated. That golden treasure, the Dutch mine, still causes its owners to wear a happy smile.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, Nov. 26: There has been extracted from all parts of the mine during the week 963 480-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $30.70 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $29.90 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $16,946.76.

OPHIR.—1465 level—An upraise started on the sill floor, on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, has been carried up 14 feet; have extracted therefrom and raised to the surface 11 tons of ore, the average assay value of which is $31.50 per ton. The Mexican mill is now working the ore, which we commenced shipping on the 23d inst. from the ore-house, in which some 400 tons had been accumulated during the past few months.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 23 feet; total length, 326 feet; continuing in a porphyry formation with lines of low-grade quartz.

UNION CON.—900 level: The joint Unioo Con. and Sierra Nevada west drift, has been extended during the week 27 feet; total length west from the joint shaft, 2664 feet. The face is in soft porphyry.

SIERRA NEVADA.—East crosscut No. 2, from Kenosha tunnel, started from north drift, 800 feet in, has been advanced 26 feet; total length, 387 feet; face in porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 27 feet, making the total distance west of shaft, 2664 feet; face in soft porphyry.

CHOLLAR.—Are retimbering upraise from 350 to 250 level. The repairs to the main shaft between the 930 and 850 levels are not yet completed. The east crosscut, 160 feet south of north line, 930 level, is out 236 feet; face in porphyry. In the east crosscut from the north lateral drift have started a drift north which is following a streak of clay and quartz.

POTOSI.—The repairs to the Ward shaft have been nearly completed and the pump column laid through the northwest drift from the Ward shaft, 1800 level, up through the Potosi winze, to the 1500 level, and pump put in place at the Ward shaft ready to pump the water to the 1500 level of the Potosi. Extracted and sent to the mill the past week 553 tons 700 pounds of ore from the 550, 930, 1100 and 1500 levels. Milled during the week 630 tons. On hand at mill, 100 tons, 600 pounds. Average battery assay, $26.45. Shipped to the Carson Mint, 399 pounds of crude bullion.

BULLION.—Have started a north drift from west crosscut, 100 feet north of top of raise above east crosscut, 320 feet south of north line, 1300 level; face in porphyry and low grade quartz. The repairs to the Ward shaft have been nearly completed.

WARD SHAFT.—The repairs to the shaft have been nearly completed, and the pump column has been laid through the northwest drift from the 1800 station, up through the Potosi winze to the 1500 level, and pumps put in place at the shaft ready to pump the water to the 1500 level of the Potosi.

EXCHEQUER.—The repairs to the Ward shaft have been nearly completed, and the pump column has been laid through the northwest drift from Ward shaft, 1800 level, and up through the Potosi winze to the 1500 level, and the pump put in place at the Ward shaft ready to pump the water to the 1500 level of Potosi.

ALPHA.—The repairs to the Ward shaft have been nearly completed, and the pump column has been laid through the northwest drift from the Ward shaft, 1800 level, and up through the Potosi winze to the 1500 level, and pumps put in place in the Ward shaft ready to pump the water to the 1500 level of Potosi.

NEW YORK.—The winze on the 650 level is down 75 feet on the slope; bottom in quartz of low assay value. A drift has been started south from the bottom of the winze; the face is in quartz yielding fair assays; 110 tons of ore have been shipped to the Washoe mill for a milling test, but owing to the breaking of the main shaft of the mill the test will not be completed for four or five days. Are taking out from the stope above the 650 level from 10 to 12 cars of ore per day, car samples assaying from $35 to $40 per ton.

SILVER HILL.—The north drift on the 160 level has been advanced 10 feet during the week through quartz, car samples of which assay $7—nearly all gold.

BEST & BELCHER.—200 level—On this level we have taken charge of the Gould & Curry northwest drift, which was advanced by them to our south boundary line, and have extended same 20 feet during the past week; face of drift is in soft porphyry and bunches of quartz. All work on the 900 level during the week has been retimbering and on repairs.

GOULD & CURRY.—200 level — West crosscut No. 5, started 432 feet from main west drift, has been advanced 18 feet through hard porphyry; total length, 121 feet. At a point in main north drift, 332 feet from west crosscut No. 3, started west crosscut No. 6 and extended same 12 feet; face in soft porphyry.

HALE & NORCROSS.—We continue retimbering main shaft at the 800 level. During the week the west drift on the 150 level of the old or A-street workings was extended 12 feet, making its total length 84 feet; face in porphyry, with some streaks of quartz.

ANNEX.—On 420 level north drift from east crosscut north, advanced 16 feet; total, 63 feet; formation, porphyry and clay. With this drift we have made an important connection that gives us a good circulation of air. No work done in the mine on the 24th.

Ferguson District.

THE COMING GREAT CAMP.—Cor. Pioche *Record*, Nov. 18: The winter of our discontent, the doubts that lingered about the camp, have passed, and we again reiterate our oft-repeated assertions that "Ferguson must be considered a factor in Lincoln county and the State of Nevada." And to prove this we will give a few items that we have from the very best of authority, that we think will show that Nature has enriched this camp with a lavish hand. The Magnolia, we are assured, is now turning

ont over $2000 per day. The April Fool has gone back to its original owners, hut we have been assnred that it is not because of any lack of value in the mine, but that it is now as rich as it ever was. The cause is found in a disagreement among those who hought it. The claim of Messrs. Gilhert and Frenchy has lately shown ore that is nearly pure eilver, with a large share of gold, and it is said to he ahnndant. The claims of Messrs. Pierson & Co., near the April Fool, are highly satisfactory to the owners, showing some of the finest of specimens, and only need development. The Reed tnnnel is progressing finely, is now more than 300 feet in length, and several ledges have heen passed, and it now promises more than ever. To speak of all the mines here that promise well would reqnire more space than you would want to devote to this place at one time. Our little town of Helene is hooming, and reminds the writer of Denver city in 1858. The question of water has heen a serious one, but is fast heing solved. Three different places are heing developed and many more prospecting for water. The initial work of digging a ditch to pipe water from the well helonging to Messrs. Garrett, Chandler, Smith & Lowry to Helene, we saw to-day, and were assured that it would soon be running into the future capital of Lincoln county. To say that our camp and town are booming is putting it very mild, and the oft-repeated phrase of last summer, "If the camp holds out," is now but seldom heard, and then spoken only by croakers. We are a fixed institution, and will be heard from in the distant futnre as one of the rich camps of the great mineral West.

Ploche District.

YUBA.—Pioche *Record*, Nov. 18: The working force at the Yuha mine has been reduced to four men. The main work is to connect the 1300-level west drift with the workings of the old Mazeppa or Meadow Valley No. 3 and thus secure thorough ventilation with the Yuha shaft, withont which the shaft requires constant attention to keep it open. The watchman at the smelter is now monarch of all he surveys, being the only resident of the place. Messrs. Scholfield and Spillman are pegging away on their Old Timer claim, southwest of town, and expect to reach the ledge in a few days.

Tuscarora District.

NAVAJO.—*Times-Review*, Nov. 26: The stopes above the 350-foot level are without material change.

BELLE ISLE.—The stopes ahove the 250-foot level are looking a little better.

NORTH BELLE ISLE.—No. 1 upraise, south 300-foot level, extended 15 feet, still yielding bunches of good ore. South intermediate, above the sonth 400-foot level, extended 5 feet, etill showing a good vein of pay ore in the face. The stopes are looking about the same. Have etarted to do the assessment work on the outside claims.

ELKO CON.—Have started to do the assessment work in a drift north from the old incline.

INNEFENDENCE.—A crosscut has heen started east from the bottom of the north prospect ahaft.

Ruby Hill District.

THE GRIZZLY MINE.—Salt Lake *Journal*, Nov. 23: This company, recently organized to pnrchase and operate the Grizzly property in Ruby Hill district, Nevada, paid the entire pnrchase price—$40,000—to W. B. Lawler, the owner. The company, which is composed of Isaac Jennings, J. R. Sharp, L. G. Hardy, A. E. Hyde, John Beck, A. M. Cannon, J. M. Fox Jr., D. W. James and J. E. Jennings, is capitalized at a million dollars, and is incorporated as the Grizzly Mining Co. A. E. Hyde, J. M. Fox Jr., and others of the company leave for the mine to-day. H. A. Mears, of Denver, Col., one of the hest mining men in the West, and whose personal character makes friends of all with whom he comes in contact, has accepted the snperintendency of the property, and under his efficient management it will douhtless develop into one of the great mines of Nevada.

BRITISH COLUMBIA.

SILVER MINES.—Tacoma *News*, Nov. 28: The discovery of silver in what is known as the Kaslo and Dnncan districts in British Columhia, is receiving a great deal of attention just now. If reports received in this city from men who have prospected on the other side of the boundary line in the new country he true, there is promise of a real bona fide mining excitement hefore spring sets in next year. The Kaslo district is about 150 miles from the Kootenay district. American prospectors flocked there early this year and they have been more than repaid for their efforts. Upwards of 200 claims have heen staked out. Improvements are being made on a great many of the claims and some of them are already being worked. When prospectors flooded the Kaslo district this summer, some of them went farther off into the conntry and another immense ledge of silver was etruck. A mining camp was also quickly formed there, and it has since been christened the Duncan district. The ore in both districts is sprinkled with gold, but not to any particular extent. Assaya that have heen taken show the ore to run from 508 to 542 ozs. of silver and from 40 to 50 per cent of lead to the ton. Without exception, the ore has been of a high grade.

EAST KOOTENAY.—Nelson *Miner*, Nov. 12: East Kootenay is confidently expecting a rush to Wild Horse creek and vicinity next year, and, from all accounts, recent discoveries and developments justify them in helieving that more interest will be taken in this country than has for the past 20 or 30 years been the case. Of course, it is not expected that the scenes of 1860–64, when flonr was $100 a sack and no one cared to work for much less than $100 a day, will he reenacted, but certainly it would seem that gold-washing by hydraulics will be carried on to a considerable extent during the coming year, as we understand that a syndicate bas bought, from Dave Griffiths, his placer claim on Wild Horse creek for $100,000, and intends to start taking out the gold as soon as tbe weather will permit. That they will he succeseful in their operations may he inferred from the fact that five Chinamen, working close to this claim, in four months cleaned up $2000 each. A strike of galena has recently been msde, the discoverer claiming (and his claims seem to be borne out by expert evidence) to have 22 feet solid ore, running 40 oz. silver to the ton, and 60 per cent lead. The total width of the lead is 32 feet, and the true walls have not yet heen found. The ore is a fine-grain galena, and the formation is gritty limestone. Woods Bros. of Winnepeg have bonded this claim for $40,000 and are now einking a shaft in the carbonates alongside the ore. The mine is in a most favorable position, looked at from a working point of view, as it is possible to drive from Fort Steele to within three miles of the lead, and it is estimated that it would cost ahout $500 to huild a wagon road from the mine to a shipping point on the Kootenay river. Eighteen prospectors have been in the district during the past snmmer, and every one of them has made a location and intends to return next year. There can be no douht that, had it not heen for the fact that the attention of mining men has been given almost exclnsively to the Slocan, the Wild Horse district would have attracted, this year, that interest from which it hopes to derive considerable benefit in the near future.

NEW MEXICO.

LONE MOUNTAIN.—Silver City *Enterprise*. Nov. 25: The ore body exposed on the Mayflower and Ruby King mines is something wonderful. An *Enterprise* representative, having heard the almost incredible stories ahont the property, drove to the mine on Tuesday to ohtain the facts by personal observation. It is little wonder that the stories told in regard to the ore body are hard to be helieved, for one acquainted and familiar with practical mining and accustomed to mining on large ore hodies will be unable to helieve the evidence of his own senses on first view of this enormous deposit of ore. The ore body is in a basin, a limestone plateau or table land ahout one mile south of Lone Mountain. It lies adjacent to a porphyry dyke, from which it in all probahility emanated. Its extent, so far as explored, is 700 feet hy 400 feet in width. The exploration is hy means of shafts, drifts and open cuts. Two shafts sunk on the east have attained a depth of 65 feet, all in ore from top to hottom; drifts run from east 50 feet to west show the same uniform ore body without hreak or fault. To the northwest and 200 feet west of the northeast shaft, an open cut 20 feet in depth and 150 feet long by 60 feet wide shows an ore body from 18 to 20 feet deep on sides. The ore is simply being quarried out of this opening. Men are employed with horses and carts hauling off the couple of feet of debris which covers the surface of the ore body and then the whole mass is heing quarried and shipped to the mill. The open cut is heing extended in every direction and heing worked upon all sides, yet there seems to be no limit or boundary to the ore body in any direction. The gangue of the ore body is a quartose rock with occasional bodies of talcose rock. The ore appears to be practically a free-milling rock, showing horn silver plentifully sprinkled throughout. Some of the talcose ores are literally coated with horn silver, some of the sides of these specimens showing hut little of the rock exposed from beneath the covering of silver chloride. Such samples would run away up in the thousands. The general average of all the openings made upon the ore assays from 18 to 25 ounces of silver per ton. It is without douht the greatest ore body developed in this country during the past ten years. Counting the ore body on the limit or extent to whicb it is at present explored—that is, 700 by 400 feet, with a depth of from 18 to 65 feet—and allowing 14 cubic feet per ton, the amount of ore so far is 861,580 tons. A ten-stamp mill is pounding merrily away on the mill site half a mile from the mine, hut it seems to be an insignificant piece of machinery when compared with the job it has undertaken, to reduce the ore from this gigantic mine. The ores exposed would justify the erection of a 50-stamp mill and if some positive and permanent price he passed upon silver there is little douht that 50 stamps will be at work upon this mine within two years.

PACIFIC.—*Southwest Sentinel*, Nov. 26: The Pacific Gold Company is treating ahout 44 tons of ore a day in the Mountain Key mill, at Pinos Altos. The Pacific mill here will not be started up for the present, because some of the machinery which was taken out and put into the Mountain Key mill would have to he replaced before the mill could be started. The Silver City Water Company can supply the Pacific mill with water whenever the company is ready to start it again. The capacity of the Pacific mill is ahout 90 tons of ore a day, but the mine can produce enough ore to keep both mills running. There are hetween 40 and 50 men at work in the placers at Pinos Altos. The supply of water is not so large as it usually is at this season of the year, and there are not so many men at work as there would he if water was plenty. The Brockman mill, at Lone Monntain, has been closed down for a few days, hut was to have started up again yesterday. It was reported that too much silver was being lost in the tailings. The Brockman mine is looking hetter than ever hefore, and the expense of mining is small. The ledge is nearly 40 feet wide, and the ore runs nearly $20 per ton in silver. There is a good prospect that the alum beds on the Gila river will be opened in the near future. A railroad is heing talked of to the Gila, which will enahle the owners of these mines to operate them on a large scale.

UTAH.

THE CRESCENT DRAIN TUNNEL.—Park City *Record*, Nov. 19: The writer was informed this week that the Crescent Co. had decided to drive the big drain tunnel which will tap its vein at a depth of 1800 feet helow the collar of the hig incline shaft, and that as eoon as Manager McGregor, who is just recovering from a severe spell of sickness, was ahle to get abont, operations would he commenced. Inqniry at the Park City office resulted in an unofficial confirmation of the rumor. Mr. Hinsdill said that while no official action had heen taken it was tacitly understood among the directors that the tnnnel would be driven and tbat it shonld start at the point selected two years ago by a careful survey. Mr. Hinsdill eaid that the work might not he commenced immediately, as there were a number of preliminaries to go through, but that it would not be long before gronnd was hroken, aud, when it was, work wonld be prosecnted without interruption until the enterprise was completed. The site chosen for the starting of the tunnel is in the first hig curve above the old trestle in "Nigger Holler," and below the tramway, being a most convenient point. The tnnnel will cut through a large scope of conntry that has really never been prospected to any depth and which is classed as mineral-bearing grouud hy all men who claim to he posted. If the tunnel is run, and there is little doubt that it will be, it should uncover some very rich mineral veins.

A PROMISING STRIKE.—A strike was made in the Black Diamond mine recently that promises to develop iuto something big for the boys who have a lease upon that property. The *Record* was shown some very rich rock Thursday last, rock that will run np in the thonsands of ounces, and was told that Messrs. Loofhorongh, Snyder and Sharp, the leasers, had 12 inches of the same kind of etuff and would soon have a carload ready for shipment. Mr. Sharp was interviewed and said that while some very rich ore had been fonnd in bunchee, and that while the vein they were working looked very promising, the extent of its richness could not he told for perhaps ten days yet. The ore is really very fine and a six-inch streak of it would make them all rich in less than a year. Tbeir lease covers the Black Diamond and Nemrod claims, owned hy C. Hirschman, thongh only the former is being worked.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Dec. 1, 1892.

Trade the past week has heen interrupted hy heavy storms. While business has heen temporarily interrupted, yet the generous and well-distributed rains in the valleys and uplands and heavy deposits of snow on the mountain ranges give encouragement of more active times in the near future. The past two dry winters had left the ground in nearly all the agricultural sections of the State sadly in need of a good soaking to insure large crops, while the absence of heavy deposits of snow on the mountain ranges gave only a partial season to miners in many of the mining districts. With the foundation well laid for good crops, and also for an ahundant supply of water, the farming and mining industries ought to he more prosperous in 1893 than for all of three years. It is hardly to he expected that we will witness much of a revival in business until after the turn of the year, owing to it heing too near stock-taking and annual settlement time.

The local money market is reported essentially unchanged. The destructive storms in last week did great damage throughout the State, which will call for the expenditure of large sums of money. These disbursements will soon find their way hack to the general financial reservoir. The rains, it is said, are already creating a feeling of confidence, and, with confidence restored, money will seek investment and many languishing industries he placed on a more substantial and profitable footing, besides bringing out new enterprises, which, in the hands of proper persons, would prove valuable investments. The disbursements in last month, in dividends, aggregate $367,175 against $379,325 in the corresponding month in 1891. The falling off was in powder, insurance and companies coming under the head of miscellaneous, and the increase came from mining companies.

Eastern mail advices continue to report a most encouraging outlook for general business, although trade would in this month he largely confined to holiday goods. After the annual settlements a liheral demand is expected to set in from the southern States, owing to hetter prices for cotton and a promising prospect for other products at the South. This Southern huying will he followed later on hy free huying from the central States. The various manufacturing industries at the East, as a rule, report a fair degree of activity, with many reporting orders ahead. An advance in the price of cotton goods and carpets, and the upward tendency in pig iron and copper, are important features and go far in confirming previous advices that the depression and stagnation in trade circles had seen its worst, and that a steady improvement might reasonably he looked for. In referring to the New York money market a leading exchange of that city says that "the ease in the money market, which has made steady progress of late, has not yet heen disturhed hy the talk ahout gold exports. Despite the continued outflow of currency to the South to move the cotton crop, the New York hanks have heen enahled to increase their cash resources through the liheral pension payments of the General Government and the receipts of money from near-hy cities. This has brought these institutions into the open market, as huyers of commercial paper, the supply of which is only moderate, particularly of desirable kinds. Out-of-town hanks have also heen huyers, and the result is that all merchants in good credit find no difficulty in getting whatever accommodations they need. The mercantile failures throughout the country continue to show a decrease as compare1 with last year, both in regard to number and liahilities. This is encouraging and increases the confidence of hank managers in paper generally. Prime indorsed hills receivahle, running from sixty days to four months, have heen discounted at 5@5½ per cent, and prime and good single names at 5½@6 per cent. The rates for lower grades of paper take a wide range, say from 6½ to 8 per cent."

The International Monetary Conference is attracting more general attention than had heen expected, which goes far in confirming the advanced views of himetallists that the financial situation the world over is considerahly strained, which, without relief, is liable to develop into a colossal panic, such as the world never hefore witnessed. Probahly this had not heen so seriously considered until a Rothschild sounded the keynote in conference which rang out the words of warning. It is to this fear that we can reasonahly hope the conference will arrive at a favorahle conclusion and act intelligently on the situation hy which silver will he rehahilitated and once more hold the position it had. The proceedings of the conference are given in another department.

SILVER—The market has ruled strong, with an advance established. The growth of the market does not indicate a speculative movement, hut a movement grounded on the supply and demand, largely predicated on the prohihle action of the Monetary Conference. Among the hetter informed in this city there is a growing feeling that the conference will disappoint croakers and monometallists and take intelligent action hy which silver will he restored to its former standing. It is also said that as this conference is a pet scheme of the present Administration, that hefore the Fifty-second Congress goes out a hill will he passed and approved conforming to the action or recommendations of the conference. Silver was strong to-day. There was exported the past week in hullion $127,200 to China and $85,000 to Japan.

MEXICAN DOLLARS—The market is strong at around 68 cts. There was exported the past week $207,692 to China and $60,000 to Japan.

QUICKSILVER—The imports the past week aggregate 619 flasks. The market is steady at current quotations.

BORAX—Reported receipts the past week aggregate 486 ctls. The exports hy sea the past week aggregate 3460 ctls to New York. The market is steady.

ANTIMONY—Exports hy the sea the past week aggregated 309 ctls. The market here and at New York is essentially unchanged.

LIME—Receipts the past week aggregate 1727 hhls. Stormy weather interferes with receipts and also with the demand.

PIG LEAD—The market is dull and harely steady. Eastern advices report a soft market, owing to sellers heing more anxious than huyers.

PIG TIN—While our market holds steady, the East is reported weak under manipulation. This manipulation extends to Europe.

PIG IRON—Imports the past week aggregate 590 tons of American. The market is reported steady, with a slightly firmer tone. Eastern advices report quiet hut strong markets. Reports from the English markets are conflicting.

COPPER—The market the past week developed more strength, with an advance estahlished. The improvement is based on large transactions at home and ahroad. *Iron Age* reports the New York market on Nov. 24th as follows: "Freer huying is attrihuted chiefly to statistics of production the world over, showing a considerahle shortage as compared with well-known capacity, and hearing *prima facie* evidence that, while there may he no international combination as alleged, there has heen a curtailment of output the world over that is most remarkable as a mere coincidence. It is only suggestive in this connection that prices have advanced more sharply in the European markets than on this side of the ocean. Toward the close of the week the report had circulation that about 6,000,000 pounds of Lake Superior product, adopted for electrical purposes, had heen sold for delivery during the first half of next year at 12½c per pound.

COAL—Imports the past week aggregate as follows: Swansea 13,065 tons, Sydney 3300, Cardiff 7633, Newcastle (N. S. W.) 1991, Seattle 798, Tacoma 2281, Coos Bay 730, Nanaimo 1566; total, 33,763 tons. Heavy arrivals preceded the present storm, which gave us liheral supplies of foreign. There is a large tonnage loading Australian for this port. Heavy rains throughout the State have inspired a feeling of confidence that we will have a large crop of wheat in 1893, which may cause more vessels to load with coal and head for this port. Our local market is firm, with a free consumption reported.

Eastern Metal Markets.

NEW YORK, Dec. 1.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39⅜	84⅞	11 90	3 75	20 20
Friday	39⅜	84⅞	11 90	3 75	20 20
Saturday	39	85⅛	11 90	3 75	20 15
Monday	39 3-16	85⅛	12 00	3 75	20 15
Tuesday	39 3-16	85⅛	12 10	3 70	19 95
Wednesday	39⅛	85⅝	12 10	3 70	20 00

Quicksilver is steady. Copper is stronger and higher. Lead is weak as is pig tin. Pig iron is steady.

Mining Share Market.

SAN FRANCISCO, Dec. 1, 1892.

Mining sbares, since Tbanksgiving, have exbibited more vitality tban for sometime past. The presen t upmove appears to be led by Potosi, with Bullion a good second. The taking up of New Yurk to start tbe move, followed by Potosi and Bullion, is looked upon by large outside operators with suspicion. Tbey see in it a bold attempt to saddle the public with shares in tbe mines which are reported to bave been marked for looting. Whether the move will prove a success is, at tbis writing, problematic. That tbe public has not taken kindly to it up till now is witnessed in tbeslow movement, in sympathy, of the lower-priced sbares. Experience has shown that when the public begins to take a hand in tbe game tbe low-priced sbares appreciate. Although tbe public is not in the move, yet it is morally certain that when prices are advanced to better figures, outside buying will again be tbe order, and with the usual result—insiders selling—and, after all is sold that can be, then setbacks until a decline is touched of from 50 to 80 per cent. This decline will not be due to a lack of merit in the mines, but entirely to a withdrawal of inside support. As long as there is large profit in milling ore, insiders care but little for deals except for tbe object of unloading shares for assessment purposes, and it is well for outside dealers to always keep tbis in view.

Experienced miners say that the cry of "if only an ore development can be made" is all rot and only raised for tbe purpose of blinding shareholders to tbe generally accepted correctness of reports that ore developments are only for the mill rings. While this is tbe prevailing opinion with mining men, yet the fact must not be ignored that since Judge Hebbard's decision in the suit of M. W. Fox against tbe late directors of tbe Hale & Norcross Mining Co., there bas been an apparently steady improvement in making out reports by the superintendents of tbe mines, and latterly of the bringing up of tbe battery assays to a nearer level with tbe car sample assays. Not only does there appear to be a dispnsition to act more bonestly, but tbere does not appear to be so much mixing of country rock or low-grade ore for tbe purpose of giving more milling and at the same time reduce tbe bullion output so that assessments are a necessity, when dividends would be declared and paid if bonest or fair management was the order.

Persons accepting a directorship in any incorporated company and who accept an office of trust under the laws of California, become, to a certain extent, public officials and their official acts become public property. As officials they should invite investigations and not shrink from adverse criticism, when, through their actions or inattention to the duties of the office, shareholders in the company are wronged.

The market opened this (Thursday) morning inactive, with Potosi sold at $1.90 and Belcher at $1.70, and Hale & Norcross at $1.55. The other sbares sold at unchanged prices. After Call, shares in the Devil Gate mines developed some strength under the lead of Justice. This improvement caused a movement in Potosi, which sold up to $2.10. The market acts as if the manipulators intend to send prices to a bigher range of values, for unless this is done the gambling public cannot be induced to buy. Already mysterious hints are afloat giving reported improvements and important work to be started soon, but it is not reported that any ore found and taken out will be milled for the benefit of the rings.

Tiue to points put out on the street, the share market began to improve soon after J. L. Flood returned from the East.

News from the Comstock mines is of an encouraging character, which, if the moneyed public had confidence in the management of the mines, would cause sbares to be selling many times bigher than they did to-day. The official letter from Potosi reports that the ore pulped last week nearly $5 a ton less than the car sample assays. The work to the east in the mines, by private advices, is said to be encouraging; but, while promising well, the sbares are only a gamble, for it may develop into something big or it may turn out a failure. Opbir is milling about 400 tons of ore, which bad been accumulated. In Con. Virginia the work going on is about the same as that reported last week. In Hale & Norcross an important west crosscut has been ordered to be started on the 1890-foot level. There is a remarkable absence of information from Cbollar. In Crown Point they bave started a west crosscut on the 400-foot level to run for tbe ore found in Belcher. It will have to run between 120 and 160 feet before they expect to strike the lode. Work in the west crosscut in Sec. Belcher is not pushed. At last advices it was in favorable ground. The official letter from Belcher reports that over 400 tons of ore was milled, which pulped $35 60.

The Carson river is said to be running bankfull, so there is no excuse for any idle mill on the score of lack of water-power

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 22, 1892.

486,692.—HOSE REEL—A. D. Coplin, Oakland, Cal.

486,513.—STATION INDICATOR—W. S. Dillon, Portland, Or.

486,704.—FURNACE—J. S. Ecker, Portland, Or.

486,451.—MEASURING CANISTER—F. Espel, S. F.

486,460.—CAR COUPLING—J. Globig, Spokane, Wash.

486,612.—ELECTRIC RELEASING DEVICE—W. R. Hewitt, S. F.

486,531.—LAZY-TONG GATE—James & Ferguson, Santa Cruz, Cal.

486,719.—RAILWAY SYSTEM—J. P. F. Kuhlmann, Seattle, Wash.

486,728.—HONEY EXTRACTOR—C. W. Metcalf, Santa Paula, Cal.

486,617.—MACHINE FOR FORMING BERRY BASKETS—R. E. Morey, Oakland, Cal.

486,737.—WOODEN VESSEL—E. M. Reese, Santa Paula, Cal.

486,622.—CONCENTRATOR—Jas. Tulloch, Angels, Cal.

486,514.—STATION INDICATOR—W. A. Turner, S. F.

The following brief list by telegraph, for Nov. 29, will appear more complete on receipt of mail advices:

California—Mark Antbony, Berkeley, two patents for faucet and bushing; James S. Brown, Eureka, neck yoke; Joseph Davis, San Francisco, two patents for water filter; John Gambetta and C. D. Harsen, compound rotary engine; Charles H. Gruenhagen, San Francisco, adjustable stand for show windows; Abel Henning, Los Angeles, diaphragm for gas meters; Robert Hewson, San Francisco, rotary motor; Albert McDowell, Selma, refrigerator; Abel Mining, engineering method and apparatus; Henry Timken, San Diego, two patents for vehicle spring.

Washington—Alfred J. Sansen, Waverly, tire-setter and cooler; James Farquharsnn, Tacoma, reversible window; Edwin Vanwart, Port Madison, combination inck.

Arizona—Andrew Knudsen, Tucson, bit-brace.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR FORMING BERRY BASKETS.—Roswell F. Morey, Oakland. No. 486,617. Dated Nov. 22, 1892. In the formation of baskets for containing small fruits like berries, cherries, etc., the inventor makes thin veneers of wood which are shaved or otherwise split out from suitable stock, having a length and width sufficient to form the bottom and sides of the basket when two of these veneers are crossed upon each other, and then properly bent into shape, and these veneers are secured in position at the top by a metal clamp which holds the upper edges, thus completing the basket. This new machine is designed to fold the veneers to form the basket and to apply the metal rims thereto after they are folded.

ELECTRIC RELEASING DEVICE.—Wm. R. Hewitt, S. F. No. 486,612. Dated Nov. 22, 1892. The general object of this invention is to provide a simple and effective relessing device for any purpose. It is especially applicable to releasing automatically-hitched animals.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco.

CALIFORNIA GUARANTEE AND IRRIGATION CONSTRUCTION COMPANY (San Diego). Capital stock, $1,000,000. Directors—D. C. Reed, H. T. Christian, George M. Dannais, C. F. Webber and George L. Arnold.

EUREKA COMPANY (San Francisco). Capital stock, $10,000. Directors—Horatio Beveridge, F. W. Spencer, Edward Klau, S. C. Scheeline and A. F. Chambers.

PIONEER DITCH COMPANY (San Jose). Capital stock, $7500. Directors—J. Q. Pearl, J. D. Roberts, Thomas Hardie, G. S. Rawlings and J. L. Mosber.

PRACTICAL TREATISE ON HYDRAULIC MINING.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

SITUATION WANTED.

Young man desiring change would like position as Superintendent for some mining company in one of the Spanish-American Republics. Large practical experience in mining and milling ores. At present in charge of one of the largest concentrating and leaching plants in Mexico. Fluent in Spanish. References. For particulars and address call on or address

MRS. M. J. C.,
226 Sutter St., San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST BORAX COMPANY. San Francisco, Nov 30, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 24) of One Dollar ($1.00) per share was declared, payable SATURDAY, December 10, 1892, at the office of the company, No. 101 Sansome Street, Room 26. Transfer books will close December 5, 1892, at 3 o'clock, P. M.

ALTON H. CLOUGH, Secretary.

PRODUCTION OF CAUSTIC SODA BY ELECTRICITY.—A process for making caustic soda by electricity has recently been discovered in England. It is stated that caustic soda, chlorine and other chemical products can be produced directly from the brine by this process. The *Northwestern Daily Gazette* of England says that the most careful tests applied up to the present time show an economy of over 50 per cent as compared with present methods. It is described as the simplest of all the known processes of soda-making, the caustic soda being produced direct from the brine in one operation instead of two. At present, carbonate of soda is first produced, and from that the caustic soda is made. The valuable chlorine is also saved and utilized for the production of bleaching powder and other lye products. Eminent chemists and electricians, it is said, have already pronounced the new method a complete success from a chemical point of view, and that there is every prospect of its being worked as a commercial success.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

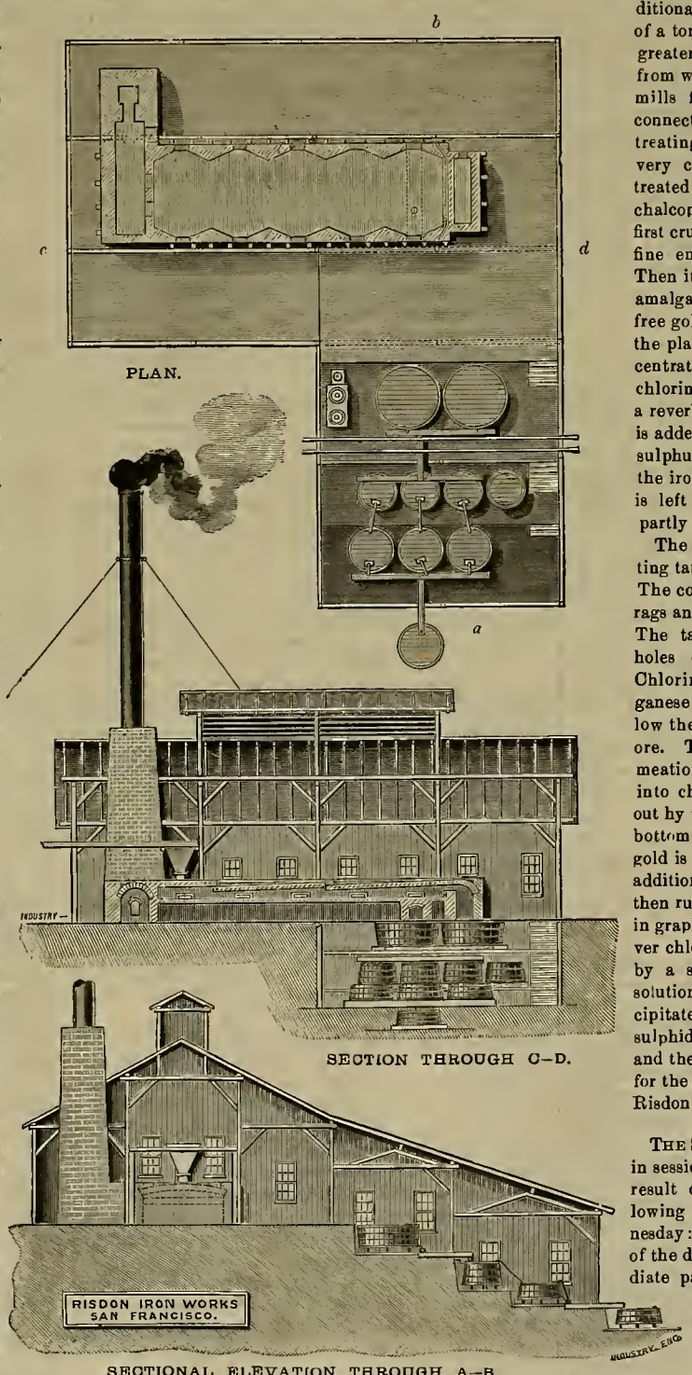
The State Mining Bureau.

We are informed that the State Board of Examiners, while in session at Sacramento this week, has officially refused to publish the annual report of the State Mineralogist, and referred the whole matter to the legislature. It decided to publish the few pages of introduction to the report written by the State Mineralogist, and also the short report of the Board of Trustees of the State Mining Bureau; but the bulk of the report embracing the work of assistants in the field, and the special papers, is refused publication. This will not be very pleasant news to the Bureau or the miners of the State. What the basis of the refusal to publish may be, we do not know; but it is understood that the report is too extended and covers some ground already gone over. It must be confessed that some of the reports already published would have been improved by more judicious condensation; but if this had been the case in the present instance, the pruning could have been done without summarily throwing out the whole report. The effect of referring the report to the legislature under these circumstances will be to call closer attention to this State institution and the methods under which it is conducted. Its object and purposes will be discussed, as will also the question whether it is accomplishing what it is intended to do. All this should be beneficial to the Bureau in the end, since, if its work is not satisfactory, it should be made so. While the miners of the State may differ on their estimate as to the value of the reports published, and the character of the material in these reports, they will certainly object decidedly to a cessation of the publication. The State Miners' Association, at its recent convention, indorsed "the work and purposes of the State Mining Bureau," and the mining representatives in the legislature will object to seeing the work stopped.

California's Mineral Exhibit.

There is a great demand for apace in the mining building at the World's Fair, and most of the States that have been awarded space are fast completing arrangements for their exhibit. California, however, is one State which is showing a decidedly lagging spirit. Though it was assigned one of the most desirable parts in the Mines and Mining building—in the center main aisle and directly opposite the Mexican display—the California World's Fair Board has not yet accepted this space. Moreover, in a recent letter to the World's Fair management, the secretary of the California association said they were not yet in a position to state whether they desire the space alloted them. There is a reason for this, however, not generally understood. In a recent Supreme Court decision in this State, relative to the utilization of the State appropriation, it was set forth that all the moneys must be spent in the State building. While, therefore, the Commission set aside $15,000 for a California mineral exhibit, they thought it necessary to put it in the State building instead of the Mining building. The Commission, however, this week decided to make the mineral exhibit in the proper building, and arrangements are being made to that end. It is understood that a typical mineral exhibit will be selected from that already in the State Mining Bureau, and such additions will be made as can be collected within the next few months. The Commissioners are anxious to make a good mineral exhibit, and Mr. Robert McMurray, who is one of the board, is doing all he can to accomplish the object. The State Miners' Association will assist, and all that is now needed is the help of the miners themselves. If they will try and hunt up any unique specimens they may have, or anything which would be of interest, and forward them to the Commission in this city, they will be doing a good thing for the mining industry of California.



CHLORINATION MILL FOR WORKING SULPHURETS.

G. A. BUFFINGTON is down from Dunsmuir.

A Chlorination Mill.

The sulphurets or concentrates caught by vanners or concentrators in gold mills have to be subjected to an additional process to recover their values. The value of a ton of these concentrates is usually many times greater than the original value of a ton of the ore from which they have been extracted. Large gold mills frequently have their chlorination mill in connection with the stamp mill, for the purpose of treating the sulphurets. The following description very clearly illustrates this process: The ore treated is quartz, carrying free gold, pyrites, galena, chalcopyrite, arsenopyrite and zinc blende. It is first crushed in rock-breakers, and then stamped fine enough to pass through a 40-mesh screen. Then it passes as a slime over silver-plated copper amalgamating plates to the concentrators. The free gold is saved in the stamp batteries and on the plates; the sulphurets are collected by the concentrators. The latter are dried and then roasted, chlorinated and leached. The roasting is done in a reverberatory furnace. About 1 per cent of salt is added near the close of the operation. All the sulphur, arsenic and antimony are expelled, and the iron and other base metals oxidized. The gold is left in a free metallic state, the silver being partly concentrated into a chloride by the salt.

The roasted ore is then transferred to chlorinating tanks, each holding from two to three tons. The covers are put on, and the joints calked with rags and luted with dough, to make them gas-tight. The tanks have false bottoms, perforated with holes of suitable size and covered with sacking. Chlorine gas, made from salt, black oxide of manganese and sulphuric acid, is then introduced below the false bottom and allowed to permeate the ore. Two or three days are required for their permeation. The gold and silver is thus concentrated into chlorides. The chloride of gold is leached out hy water added at the top, and drawn off at the bottom and run into precipitating tanks. The gold is precipitated in a fine metallic state, by the addition of the sulphate of iron. The water is then run off, the gold collected and dried, melted in graphite crucibles and cast into bars. The silver chloride remaining in the ore is dissolved out by a solution of hyposulphite of calcium. The solution is run into other tanks, and the silver precipitated as a sulphide by adding calcium of polysulphide. The sulphide of silver is dried, roasted and then melted and cast into bars. The designs for the mill shown on this page are those of the Risdon Iron Works of this city.

THE SOUTHWEST SILVER CONVENTION has been in session at El Paso, Texas, duringthe week. The result of its work may he summed up in the following resolution, which was adopted on Wednesday: "We demand of Congress the restoration of the double or bimetallic standard by the immediate passage of a bill for the free and unlimited coinage of silver at a ratio not to exceed sixteen to one of gold, and silver coined to be a full tender for all debts whatsoever." A resolution demanding statehood for Utah, New Mexico and Arizona was enthusiastically adopted. .

EASTERN NEVADA is said by experts to be one of the most fertile mineral regions of the world. All it needs is a railroad, and the railroad will be the means of making many millions.

Comment.

We receive many letters from millmen who have been experimenting with the cyanide process, who, while they seem able to dissolve the gold in the ore, are unable to get all out of the solution. This is the general complaint in experimental cyaniding operations. In conversation this week with Mr. E. W. Merrill who has had considerale experience with this process, he said that "the main trouble is that the people who fail in this allow their solution to flow too rapidly through the zinc and do not keep the zinc loose enough; that is, they let it pack. When the zinc is put in they let it go in lumps instead of letting it set as lightly as possible. A further difficulty is experienced through not having a box large enough and not having this box insulated. There are several forms of boxes, but a thoroughly insulated iron box with tar and asphalt is good. At the Mercur mill, Utah, this is used and does the best work. It should be understood that in cyaniding operations the fine ore is going to give the most trouble; that is, where they have to crush the ore very fine. A roasted ore will filter all right, but with finely crushed raw ore there is apt to be trouble. It gives such a slow leaching rate that the amount of time and cyanide consumed is great. If a man would invent a machine which would agitate and filter at the same time, it would be a great advantage, but efforts in this direction have thus far been futile."

The report of the board appointed to select a site for a Pacific coast deep harbor has been filed. It recommends San Pedro as against Santa Monica. The last-named was the choice of the Southern Pacific Railroad, and last year C. P. Huntington wrote a letter to Senator Frye, chairman of the Commerce Committee, favoring Santa Monica. After the Government worked fifteen years or so to make a harbor at San Pedro and finished its breakwater, etc., it would seem the best place to make a really good deep-water harbor. There is a good natural nor'west shelter at San Pedro which answers in summer, but outside the breakwater the place lies open to winter southeasters. There is good room inside the breakwater, but much dredging would have to be done to make it fit for deep-water vessels to enter at all stages of tide. Santa Monica has no natural nor'west shelter for summer, as it is a mere open roadstead, but Point San Pedro gives it partial shelter from southeasters. Still it by no means compares with San Pedro, where so much work has already been done. San Pedro was the principal port in the old hide-droghing days when California belonged to the Mexicans, and a mighty mean place it was then in winter, the vessels having to slip and go to sea as soon as the wind veered south in winter months. Still, it is sheltered from the summer winds. The swell is less there than at Santa Monica, and the engineering difficulties for building an artificial harbor are less. If the selection of the proper localities for the necessary harbor improvements were left to the engineers, without the interference of railroad or real estate corporations, they could get something done worth while; but the trouble is, the Government is too often asked to build up a place for the benefit of individuals or companies, rather than the general public. With a good big single appropriation, such as was—for a wonder—given to Humboldt, for instance, the engineers could do something with San Pedro, which would give Los Angeles a decent port for deep-water ships. As the metropolis of the south coast of California, it should have such a harbor and have it without further delay.

River-bed mining is carried on at many places in this State with considerable success. In most localities it is conducted in the old-fashioned way, and in others newer systems have been applied. The largest operation in the State, in Butte county, where a very long and expensive tunnel was run to carry the whole river, and lay bare some miles of bed, was not successful. An instance of successful operations on a new plan is at Mammoth Bar, south fork of the middle fork of the American river, about ten miles from Auburn. Here Col. W. S. Davis has been using a gravel elevator such as was described in the PRESS two weeks ago, stripping several hundred feet of bedrock at a depth of 60 to 70 feet from the surface. Over 100 men, mostly Chinese, have been employed. These present river-bed mines are but beginning to be worked on a systematic and successful scale. The introduction of the gravel elevator was a vast stride toward overcoming the difficulties and uncertainties attendant upon the old methods of flume, wheel and China pumps. The main drawback to the extensive prosecution of this class of mining at present by this method, and in the section referred to, is the lack of sufficient waterpower. Col. Davis is able to secure but 400 inches, for which he pays 10 cents an inch. Could he secure all he desired, he would have 500 men employed another season. There are many rich bars on this stream waiting to be worked in the same manner, and only wanting water. The McKinstry estate at Butcher Ranch, owning rich seam diggings near the river, from which a $2500-nugget was lately taken, possesses an 11-mile ditch with a present capacity of 100 inches, bringing water from Owl creek. This can be purchased, and probably could be enlarged to carry sufficient water for working some of these river gravel claims.

ON Monday, at the Union Iron Works, steam was raised in the Monterey's boilers, and applied to the hydraulic force by which the gun carriages are operated. The adjustment of the contrivance for taking up the recoil of the big 10 and 12-inch guns, or rather reducing it to a minimum of something like 40 inches, is a nice piece of work, and Lieut. Nicholson, the expert in such matters, is insisting that everything shall be just so before the guns are mounted. The contractors have finished their estimates of the weight that is to be put on board in place of the turret armor, crew, stores, ammunition, etc., and will be ready for the horsepower trial late this month. The vessel is expected to go into commission on January 10th, but much yet remains to be done.

The idea of having a topographical map of California on a larger scale than yet exists is being discussed, but there appears to be quite a difference of opinion with respect to it. The plan proposed is for the U. S. Geological Survey to manage the work and the State pay half the expense. The scale proposed is an inch to the mile and it will cost the State $25,000 a year for eight or ten years. It is only proposed to map the valley and foothill lands, as the gold belt of the Sierra is now being mapped by the Survey. The Academy of Sciences has passed resolutions in favor of the scheme, while the Technical Society of the Pacific Coast—in which there are many engineers—refuses to indorse it. The subject is one of considerable interest and we should be glad to have engineers and map-makers express their views in the columns of the PRESS. Some of the other States have these detailed maps, and we have, in California, arrived at a period when one is desirable here. The main question is, how to get it without too great expense. If it can be shown that the Government and the State can advantageously combine to make the map, there would be no objection. Many believe, however, that it could not be done for the cost stated. Others, again, believe it can. We should like to have some written opinions on the matter from people who have had experience in such things.

Trinity county has taken the necessary steps to form a County Miners' Association, and next Sunday the organization will be perfected. Judge T. E. Jones, Dr. S. L. Blake, P. M. Paulsen, Henry Burns and James W. Bartlett have drawn up the necessary constitution and by-laws which will be adopted on Sunday. All the mining counties in this State should maintain these organizations, which give strength and backing to the State Miners' Association and enable it to accomplish something. There are now between 4000 and 5000 miners in California banded together to aid their industry. It only costs in money a few dollars a year, but with a strong organization they are in a position to have attention paid to their demands. Trinity is mainly a mining county, but until now there have been no attempts at organization among the miners. There are still several counties without miners' associations, but they should all come into line at once.

It may be news to many that the labor employed in the actual production of the precious metals is extremely well paid and very productive—better paid and more productive, in fact, than any of the other industries of the country. There are employed in the gold and silver mines of the United States 57,307 men. The census statistics show that the average earnings of these men was $729 per year, while the average output per man amounted to $1732 a year. In the granite-quarrying industry the average output per person in 1889 was $648 and the average wages per annum $431. In coal-mining west of the Mississippi river, the average value of output per person employed was $675 and average wages earned $474. If miners and laborers underground are classed together, as all classes of labor above ground are, the average wages earned underground would be $3.04 per day, as compared with $2 51 above ground. Taking the whole United States, the average wages paid in precious-metal mining are for surface foremen, $4.04; mechanics, $3.67; laborers, $2.51; below ground, foremen, $4 16; miners, $3.12; laborers, $2.46. The averages are brought down by low prices paid in Southern States. The highest wages are paid in Alaska, Idaho and Nevada.

Foundry Notes.

THE Fulton Iron Works are preparing their new site on the waterfront at Harbor View, and will soon commence operations out there. Ever since the fire, the proprietors have been anxious to get suitable shops. The new company will engage extensively in ship-building, and will have ample facilities for this class of work. It has already established a good reputation for marine work, but with wharves, ways and docks will have exceptional facilities. It will not be very long before the new plant will be in operation, and many things are being moved this week.

An opinion, dated December 5th instant, has been handed down by the Hon. Joseph McKenna, Judge of the Circuit Court of the United States in and for the northern district of California *in re* S. R. Smith *et als*, patentees of the "Climax" bandsaw mill, *vs.* the Vulcan Iron Works of this city, which briefly stated, orally, by the court, is as follows, viz.:

"This is an action for the infringement of a patent for a bandsaw mill. The defense is want of invention and of novelty, and that respondent has not infringed." A great deal of testimony was taken and the case ably and elaborately argued; and, after quoting the statements of the counsel of the complainant, and as well that of the counsel for the respondent, in which arguments were submitted as to the main points involved in the claims of the two patentees, and resting principally upon the fact of the casting of one machine in one piece and the other in two pieces. The court determines in the following language: "Manifestly, if casting in one piece is the best, its advantages are secured by casting in two pieces and bolting them together, as in the machine of the respondent. It is certainly an equivalent, and could not be excluded except by express words of the patentee, confining his invention to the other form. The view is clearer as to the straining devices. There are undoubtedly invention and novelty in them, and those used by the respondent are substantially similar. It imitated as closely as it dared and not make exact resemblance. A decree will be entered for the complainant."

The foregoing epitome of the decision of the Hon. Judge of the U. S. Circuit Court in and for this district we believe will be of interest to all who are or intend to become interested in the lumber industry of our Pacific States, for it declares that the bandsaw mills built by the Vulcan Iron Works, of this city, are infringements upon the principles involved in the construction of the "Climax" bandsaw mills built by Messrs. Smith, Meyers & Schiner of Cincinnati, Ohio, for the sale of which the Joshua Hendy Machine Works of No. 51 Fremont street, this city, are the agents.

DURING the month of November, local corporations paid a total of $367,175 in dividends, against $379,325 for the same month in 1891. The insurance companies paid $5875, gas companies $86,000, water companies $70,000, powder companies $19,500, street railroad companies $18,000, mining companies $157,300 and miscellaneous companies $11,000.

Coast Industrial Notes.

THE Bodie *Miner* says it is rumored, and the report seems to be given credence, that by the 1st of January the number of men employed in the mines there will not be more than one-half of those at work now. The outlook for the immediate future is not very encouraging.

A LARGE water-storage project is that on the Arizona canal, nine miles from Phœnix. Work will begin at once to put an embankment on the west side of the canal at the distance of three miles, which will form a lake of that length and 20 feet deep. Water will be let in from the Arizona canal during the rainy season.

AT the meeting of the Alameda Board of Supervisors this week, the petition of the Oakland, Alameda and Piedmont Railway Company for permission to change its system to Alameda from a streetcar line into an electric road was granted. The work of making the change has been commenced. Senator Eli Denison and Colonel F. H. Meyers are the principal backers of the road.

THE Bitumen Consolidated Mining Company has sued the San Francisco Paving Company to recover $12,000 damages for the breach of a contract by the defendant not to purchase any bituminous rock, except from the plaintiff, for two years from January 1, 1892. The rock was to be paid for at the rate of $7 a ton, delivered at the wharf in San Francisco from San Luis Obispo, and $6 a ton from Santa Cruz.

WHITE HILLS, Arizona, from present indications, will soon be the most thriving and prosperous mining camp on the Pacific coast. There is no rush or stampede to the new mines, but a steady influx of intelligent miners who have come to stay, and know a good thing when they find it, and one and all declare that White Hills is far ahead of anything they have run across since the palmy days of '49.—Mohave Miner.

THE Palace Grande Coal and Transportation Company has struck a vein of brown coal in its new tunnel on Mark West creek, five miles northeast of Santa Rosa. The company, including several citizens of Santa Rosa and vicinity, with several well-known mining men of San Francisco, has secured about 2000 acres of the coal land, including Dr. F. Wrightson's ranch, for which they paid $10,000, and intend pushing developments.

THE Must-Condensing Company of Geyserville is anxious to remove its plant to Healdsburg, providing the citizens of that place will give it some inducement in the way of a bonus. Baron Schilling, one of the biggest stockholders of the Must-Condensing Company, was in Healdsburg last week, and all the citizens he had spoken to in regard to the scheme gave him much encouragement. Healdsburg needs a few more manufactories.

J. F. BERGIN, president of the San Francisco and North Pacific Railroad. F. S. Chadbourne, W. D. Sanborn, Al Wieland, Fred Yungling, H. N. Gray and General McMutrie, and other San Franciscans, have been at Ukiah, Mendocino county, looking up the prospects for building a railroad from Ukiah to Round valley, 60 miles distant, where a large body of coal is said to lie undeveloped. The storm interfered with the trip.

THE Electric Light Company has commenced to carry out the order of the Board of Supervisors, passed a fortnight ago, to replace the large 160-foot masts in the district bounded by Castro, Folsom, Twenty-first and Twenty-ninth streets, with 40-foot masts. Poles are being placed on Church, Guerrero, Dolores and many of the streets, preparatory to the change. It is the intention to erect 65 of the smaller masts of 2000 candlepower in place of the larger 16,000-candlepower lights. The change is very distasteful to Mission residents.

THE Pine Ridge flume has been completed sufficiently to turn the water into Dry creek from Stephenson creek, 12 miles beyond. Water is brought in sufficient quantity to irrigate 50,000 acres of land in Fresno county, which have never yet been under a canal. This flume is the largest in California, and the first 12 miles were completed last summer. It will be extended to Fresno next year for the purpose of floating lumber in addition to its irrigation facilities. Additional arrangements are being made to build the flume still farther into the mountains to tap the upper tributary of the San Joaquin river.

THE *Enterprise* says the unfavorable outlook for Virginia at present is engaging public attention. The low prices governing mining stocks, the number of men out of employment, the financial condition of Con. Virginia, and the barren appearance of the mines in general, is affording food for serious meditation, which has, to say the least, a depressing effect. The heavy drafts of men in the Gold Hill mines would in themselves be a serious weight upon the temporary prosperity of the lode, without the addition of unfavorable conditions in Con. Virginia affairs. The mine is not self-supporting and an assessment is staring the stockholders in the face.

STEWART MENZIES, Oliver Eldridge and Charles Nelson, the committee appointed by the Chamber of Commerce to draft a bill in favor of a training-ship for the coming meeting of the legislature at Sacramento, have in hand a report on the schoolship St. Mary's, prepared by the Chamber of Commerce of New York. It appears from this report that the boys who have spent two years on board the St. Mary's are good ordinary seaman, and most of them fairly good navigators. The committee named above have fully considered both the St. Mary's or American plan and the Conway or English plan. The ship to be used, if the legislature takes action, will be a school in the strict sense of the term and not a reformatory. The idea is to make good American seamen.

A NEW irrigation canal is being surveyed from Lake Tulare northward to the San Joaquin river, near Mendota. A corps of engineers are at work and have the preliminary survey about done. It is not understood what company is at the head of the enterprise further than that the Sunset Irrigation Co. has nothing to do with it. The canal will be about 80 miles long. It will follow northward along the center of the valley. Water will probably be stored in Lake Tulare in the winter and used in the dry season. It is also said that waste water from another canal will be led to this canal and used for irrigation the second time. The eastern side of the valley slopes gradually toward this new canal, and in many places there are streams of considerable size flowing from old canals as waste and superfluous water.

IN the Senate, Wednesday, after the presentation of the treasury report and the President's message in regard to a naval establishment on the great lakes, Hill introduced a bill to repeal the Act of July, 1890, directing the purchase of silver bullion. It was referred to the committee on finance.

MILLER & LUX, says the San Benito *Advance*, have at this time on their great ranch in Kern county, 28,000 sheep, 35,000 cattle, 6000 hogs, 12,000 tons of alfalfa-hay, 28,000 sacks of barley, 12,000 sacks of wheat, 5000 sacks of oats. Also 3000 acres of Egyptian corn, which will produce yearly 6000 tons of cereal food.

A NUMBER of important changes are being considered by the directors of the Oakland and Berkeley electric railroad. One of the propositions is to run the cars only as far as Seventh and Franklin streets, and put a single car on Franklin street from that point to First street. Then the cars of the Sixteenth-street branch will run down to Seventh street, as will also the cars of the cemetery line. This change would give Franklin and Grove streets a two-minute service. To Fortieth street the cars would run every four minutes, and Berkeley would have a six-minute service. The Telegraph-avenue electric road is now about completed, and it is expected that trial trips will be made within two weeks, and regular service commenced by the first of January.

AN important enterprise of a mammoth electric-light and power plant in the Santa Ana canyon, about nine miles from San Bernardino, has been under consideration for several months past. Its proposed scope is to furnish electricity to San Bernardino, Riverside, Redlands, Colton and other neighboring places. W. H. Goucher has been in charge of the preliminary work of making surveys and formulating plans for the great work on behalf of a number of Eastern capitalists. The plans, together with all obtainable data as to the possibilities of the scheme, were recently sent East to the Westinghouse Company for expert examination and approval. It is estimated that the entire plant will cost $500,000, and a large item of the cost will be the piping of the water under pressure to be used in operating the works. This will require about seven miles of heavy piping, but will give a pressure at the point of application that will furnish a maximum of 8000 horsepower. The machinery necessary for the plant will cost about $250,000.

A DISPATCH from San Diego says: J. L. Clark to-day completed the sale of the great onyx quarries at Los Tules, Lower California, owned by the widow of the late Cassimiro Murillo. The money was paid over by the consolidated National Bank, which held the purchase papers in escrow. The price paid was $100,000, half cash and the balance in stock of the company which has been formed to work the deposits. The purchasers are: Ex-Governor Eli H. Murray and George Foster, of this city, partners of Murillo, J. P. Alexander of Louisiana, Professor George S. Fellows of Washington and capitalists whom Fellows represents. The quarries are to be worked on a large scale, the rock being shipped in the rough to San Diego, where it will be blocked and forwarded to an Eastern factory for polishing and cutting. As business progresses, it is intended to establish a factory at San Diego. The quarries are about 200 miles south of San Diego, 20 from the gulf and 50 from the Pacific.

THE other day Judge Morrow of the U. S. District Court decided the case of Charles R. Allen vs. the United States. Allen is the owner of a steam vessel, and used imported coal, upon which there is a duty of 75 cents per ton. Under the tariff law previous to October 1, 1890, the duty on imported coal used on steam vessels owned in the United States was subject to a rebate, but after the passage of the McKinley bill the customs officers refused to pay the rebates, on the ground that the new law repealed all tariff laws previously in existence, and did not specifically provide for this rebate. Allen brought suit to recover rebate on something over 190 tons of imported coal. The case was tried before Judge Ross in September, and a decision rendered in favor of plaintiff. A demurrer was entered and argued before Judge Morrow. The case was submitted for consideration and decision of questions of law, and his Honor sustained the decision of Judge Ross. The McKinley bill provides that on all articles imported into the United States on which duty is paid and used in manufactures which are again exported, the duty paid may be rebated to the importer. On this provision the decion is based. The case will settle a question of considerable importance to owners of steam vessels in the United States, as they will be able to get coal practically duty free.

THERE is a proposition to utilize the street-sweepings of this city to fertilize the soil in Golden Gate Park. The material will all be carried out at night and the transportation is to be done by the new electric-car line. Mr. Esston, president of the new line, says: "Any of the motors we have now can haul the cars out at a moderate speed, and as we intend to run a branch right down to the park we can dump the fertilizer just where the commissioners want it. The work will all be done at night, and that will warrant us in giving our patrons an all-night car. None of the cable roads have been able to do this, because the expense would be too great. But an electric line can and will. We may run half-hour trains from midnight until 5 o'clock in the morning, but if the travel warrants it we will make the trips more frequent. You can state it as a positive fact that our road will give the first nightcar, and that in a very short time. We intend to double our equipment inside the next sixty days to meet the increased travel. It will cost just $200,000. The cars we are running now on the main line will be put on the branch to the Olympic Club grounds. The new cars for which we have called for bids will be double-enders, setting closer to the ground than the one now in use. Then there will be several large open cars. They are in great demand, and we find it absolutely necessary to have them.

AT the last meeting of the State Board of Prison Directors, an order was made looking to the establishment of a cordage factory at Folsom prison. The warden was directed to get estimates of the cost of machinery for the manufacture of cordage, to the end that the directors might make a recommendation upon the subject to the Governor and the legislature. The State has just constructed at Folsom, at a cost of more than $100,000, a powerhouse to utilize the water of the American river. This building contains seven Leffell wheels, capable of producing 700-horse power. The water will be turned on at these works some time next month, and the directors of the prison are casting about to utilize the power. Mr. Sontag is decidedly in favor of establishing a cordage factory, and a bill will be introduced in the legislature to that end. It is probable, however, that there will be opposition to the plan, as many people dislike to see convict labor come into opposition with free labor. In the matter of jute bags, the needed amount cannot be supplied by factories in this State, but in the matter of rope it is different. The cordage factories now running here can supply all the demand.

Ada counnty, Idaho, is having a diamond excitement. On the south bank of the Snake river, near Walters Ferry, a diamond field is announced as discovered and said to be of the same nature as that of the Kimberly fields, South Africa. The discovery, which has created such a furor, was made about a week ago by a party of surveyors who were at work on the site of a proposed dam, near the mouth of the Bruneau river, in Owyhee county. Suspecting that the peculiar stones which they had unearthed were either opals or gems of even greater value, the engineers communicated with friends in Portland, Oregon, to whom they forwarded half a dozen specimens. The Portland people were assured by two reliable jewelers that the stones were diamonds. Upon the next Eastbound train nine excited men left Portland for Nampa, Idaho, arriving at that town and proceeding immediately to the scene of the discovery. Their evident haste and their manifest efforts to maintain strict secrecy as to their movements awakened the curiosity of Assessor Russ Walter of Ada county and he followed the party. It did not take him long to discover the object of the headlong race of the men from Oregon, and as quickly as he could do so he repaired to Walters' Ferry, and by telephone ordered Attorney C. C. Stevens of Boise city to prepare necessary papers for the location of three 20-acre diamond claims. He also wired Charles Van Dorn and James Lawrence to hold themselves in readiness to accompany him to the scene of the reputed bonanza where he would put them upon rich claims. This will not create much interest in California for we had a "diamond excitement" here some years ago which turned out disastrously to all except those on the inside. Montana had some diamond fields also, but no one has become rich out of them. The Idaho fields may be of value, but we should want the testimony of other than a few excited prospectors before investing in any claims.

Personal.

C. C. WALLACE is down here from Eureka, Nev.

C. L. CLARK, a mining-man from Helena, Mont., is at the Russ House.

E. W. BURK, interested in mines at Helena, Mont., is visiting San Francisco.

MR. A. B. PAUL of Middle Creek, Shasta county, is in the city for a few days.

ALF. TREGIDGO, Pres. of the Nevada County Miners' Association, has been in the city this week.

MR. HOFFMAN, superintendent of the Red Point mine, Forest Hill divide, Placer county, is in the city for a few days.

MR. J. H. NEFF, President of the State Miners' Association, was seriously hurt this week, and is confined to his home at Colfax.

J. E. DOOLITTLE, the well-known mining man of Dutch Flat, who, by the way, does not like the Caminetti bill a little bit, is in the city.

MESSRS. ANDREW, BEVERIDGE AND ROCHFORD, mining men of Salt Lake City, are in Winnemucca, Nev., for the purpose of inspecting several mining properties.

DR. E D. PETERS, JR., of Boston, the well-known copper expert and author of "Modern Copper Smelting," arrived in the city this week on his way to Australia, where he will remain six or eight months. He goes to make an investigation into some extensive copper properties, and prepare plans for suitable reduction works.

MR. C. W. MERRILL, who has been at Bullychoop, Trinity county, for some time past, has returned to the city, the mine having closed for the winter. Mr. R. G. Hart, the owner of the property, did not get the tramway completed in time, so he will not be able to work during the winter. Mr. Merrill has been experimenting with the cyanide process for Mr. Hart.

JOHN B. HOBSON, formerly of Iowa Hill, Placer county, and one of the delegates sent to Washington on behalf of the State Miners' Association, has returned to this city from British Columbia, where he has been during the summer. Mr. Hobson has the reputation of being one of the best hydraulic miners in California, and was sent for to take charge of a hydraulic mine in British Columbia. He will remain in this State for a month or two and then go north again to resume his duties.

THE new State Anti-Debris Association has employed Robert T. Devlin as its attorney. Mr. Devlin has for some time been employed as special counsel for Sacramento county in debris legislation.

Sterling Silver.

All silver coin issued at the British mints, and also all silver goods stamped at the British assay offices, says *Iron*, consist of an alloy, 1000 parts of which contain 925 parts by weight of silver with 75 parts hy weight of copper. Silver of this composition is what is known as standard or sterling silver. With regard to the derivation of the term sterling, Johnson states that the most probable is that proposed by Camden, who wrote: "They are much mistaken who think that our good and lawful money of England, commonly called sterling money takes its name from hence (*i. e.*, Stirling Borough and Castle), for that came from the Germans, who were termed Easterlings by the English from their living eastward, and who were first called in by King John to reduce the silver to its due fineness, and such money in ancient writings is always called 'Easterlings.'" The fioeness of sterling silver is frequently expressed by saying that it is of a standard of 11 oz. 2 dwt., which is intended to indicate that each troy pound of the alloy contains this weight of silver, the remaining weight of 18 dwt. being made up of some other metal. The other metal employed is, as a matter of fact, invariably copper, but it is not necessary that it should be so; the law only requires that standard silver shall contain 11 oz. 2 dwt. of silver per Troy pound, and does not concern itself with the alloying material. In this connection, it may be added that the word alloy, when used in connection with silver, is technically understood to apply only to that part of the mixture which is not silver; thus, in standard silver, the alloy is technically understood to be that 18 dwt. of copper with which the silver is diluted, and does not apply, as in ordinary usage, to any intimate mixture of metals which have been melted together. The word alloy, however, seems to have been first applied exclusively to mixtures of the precious metals, gold and silver, with some other baser metal. Johnson states the word alloy is derived from "*a la loi*," indicating that the standard of the gold or silver was that appointed by law. It seems, however, more prohable that the true derivation is from the French *allier*, to uoite.

The standard of silver now in use appears to have been employed from the Conquest until the present, with the exception of a short period of ten years during the reigns of Henry VIII and Edward VI, from 1542 to 1552. During that period the standard underwent most extraordinary variations, no less than eight separate acts of Parliament being considered necessary to regulate it, mostly to reduce it, and in 1551, during the reign of good King Edward, it was reduced to as low as 3 oz. of silver to the pound, presumably to the advantage of the Royal Exchequer. Once again, in the reign William III, in 1696, the standard was altered, being this time raised from 11 oz. 2 dwt. to 11 oz. 10 dwt. of silver per troy pound. This alteration was intended to prevent the melting down of silver coin into plate, a process which would be somewhat unprofitable nowadays, and which points back to a period which the unfortunate recipients of salaries paid in rupees must think of with regret, when silver coins were not yet merely currency tokens, but actually had the value in metal corresponding with the value stamped on their faces. It appears, however, that the danger of the large withdrawals of silver currency which this Act was intended to prevent must have quickly disappeared again, for in the reign of George I the old standard of 11 oz. 2 dwt. to the pound was again revived, and has continued in force to the present date concurrently with the standard of 11 oz. 10 dwt., which latter is, however, practically never used. Ooe of the chief reasons for once more returning to the lower standard was said to have heen that the articles made of the richer standard did not wear so well as those made with less silver. Indeed, one of the great advantages obtaioed by alloying silver with copper is the great increase in hardness and resistance to wear thus obtained, for pure silver, presenting a somewhat small resistance to abrasion, wears away too quickly.

Attempts have been made from time to time to employ some other metal than copper as an alloy with sllver, but hitherto no very successful results appear to have been obtained. It would seem that copper still holds the first position as yielding an alloy which, while harder and wearing better than pure silver, does not alter its color when present in reasonably small amounts, and does not deteriorate the working properties of the metal for manufacturing processes requiring stamping, rolling, casting or engraving. Recently, however, an interesting application of an alloy of silver, zinc and cadium has been introduced for silver-plating by the London Metallurgical Company, of Turnmill street, London. The alloy is deposited electrically upon the article which is to be coated with the precious metal. An alloy of cadmium and silver is said to work well, and to show greater resistance to abrasion. It is, moreover, not nearly so readily tarnished and blackeoed by the traces of sulphuretted hydrogen always present in the air, as is standard silver. As it is considerably cheaper than pure silver, which has hitherto alone been employed for electroplating purposes, its superior resistance to wearing and tarnishiog actions apparently gives it a great advantage over the ordinary silver-plating, and as its color is equal to that of silver, it should have a good future before it. It appears somewhat extraordinary that, in spite of the enormous advances which have been made in chemical and metallurgical knowledge, no other more satisfactory silver alloy has yet been discovered for coining and other purposes than the alloy used 800 years ago. It is true that alloys of silver and nickel and copper have been manufactured, and, indeed, coins cootaining these metals with small amounts of silver are actually in current use in Switzerland and elsewhere, but no alloy of this character seems to have come into general use in place of standard silver.

It is required by law that, with some few exceptions, the quality of all standard silver articles shall be determined by assay at any certain offices authorized for that purpose, and that, if found equal to standard, it shall be stamped with what is generally known as the hall-mark. It is a popular error to imagine that this hall-mark upon all standard silver articles made in Great Britain is always a lion, or, more correctly, a lion passant. The fact, however, is that in Dublin the hall-mark of the Goldsmiths' Company is a harp crowned, and the nnly silver stamped is that of the 11 oz. 2 dwt. standard. The Edinburgh hall-mark consists of a thistle for the 11 oz. 2 dwt. standard, and a figure of Britannia is added to this to indicate the 11 oz. 10 dwt. standard. At Glasgow, a lion rampant is employed to indicate the 11 oz. 2 dwt. standard, and as at Edinburgh, a figure of Britannia is added to indicate the 11 oz. 10 dwt. standard.

In England, at the assay offices in London, Chester, Exeter, Newcastle-on-Tyne, and York, the hall-mark for silver of the 11 oz. 2 dwt. standard is the well-known lion passant, and to iodicate the richer standard of 11 oz. 10 dwt. a lion's head erased (*i. e*, without the body) is employed. Finally, at Birmingham and Sheffield, the 11 oz. 2 dwt. standard is indicated by the lion passant alone, and the 11 oz. 10 dwt. standard by the figure of Britannia alone. The other marks on silver besides the hall-marks are the letters which indicate the year of assay, and the sovereign's head indicating the payment of duty. At the Dublin office, the figure of Britannia is added for the same purpose, heraldic arms showing the place of assay, the initials of the maker usually being added.

Machine Mining.

Ten years ago machine mining was looked upon almost entirely as an experiment in which few had any faith, or were willing to hazard capital in. To-day the experiment has become an assured success, and machine mining is fast becoming the rule and not the exception. It has been estimated that for the year 1890, out of a total of 12,638,364 tons mined by all methods, 2,881,983 tons were mined hy machinery, being 23 per cent of the total. In one particular district for the same period, of a total of 3,716,464 tons mined, 1,615,453 tons, or 43 5 per cent of the total, were mined by machinery; and in yet another district, covering the same period, of a total of 3,240,204 tones mined, 1,101,262 tons, or 34 per cent of the total, were mined by machinery; and succeeding reports will show increased percentages. In other quarters there will show percentages that, compared with previous years, will prove that machine mining is steadily increasing, and there are scarcely any of the coal-producing districts where machines are not being or have been used with more more or less degree of success, in other respects as well as financially, when under proper conditions, and earnest effort has been made to make them succeed. Ten years ago the miner who worked with or after machines was a "blackleg" to be shuoned by his fellow-workmen, and often followed his occupation at the risk of the "boycott," personal injury, and even loss of life from those opposed to the innovation. This has all changed, and to-day the machine miner and laborer form a large portion of the mining class, and are often the commanding influence. Where machine mioing has been successfully organized and carried out, the result has been greater regularity of work and better wages for employes. So far, machinery for mining is confined to machioes for "undercutting," "shearing," and "drilling," and which, hy cutting the vein horizontally or vertically, and drilling holes for blasting, prepare it for the work of the miner in charging, blasting, assorting, loading, and timhering. Machinery for these latter purposes has not been introduced, though experiments are continually heing made with machines for loading, aod the writer has seen two patterns that in a large vein with good roof would do the work very well; it is to be hoped that a successful machine will finally be devised to relieve this, the most laborious portion of securing coal. The cleaning of coal from its impurities, where the same exist, and throwing them back ioto the goh is a task that can hardly be accomplished by machinery, which can only be expected to lift the mass from the floor and deposit it in the cars. Where these impurities do not exist in too great an amouot, the cleaning can be done more thoroughly and economically by proper coal-cleaning machinery placed in the tipple outside. Electric batteries for firing blasts after the charges are tamped, and the use of lime cartridges and powder wedges for breaking down the coal may be mentioned as attempts to do the breaking down by machinery, but have not come into general use. For timbering, machinery has nothing to offer, and it is only indirectly that a saving can be effected in this departmeot of the work; by deep undercuttings, the roof if tender is shattered less by the blasts; and as machine mining gets over the ground much quicker than the older method, rooms are drlven their length and finished before timbers need replacing. To offset this, places for machinery are generally driven as wide as possible, in order to give the machine the advantage of working steadily aod preventing the loss of time in moving frequently from one face to another; this will take more timber, and it becomes a nice point to determine on the score of economy just where to draw the lioe between the two. The power used to operate mining machinery has been almost entirely compressed air. Of late, electricity has become a recognized factor as such, and there is no doubt but that in time, with improvements in application, it will become more and more so. At present the most successful machinery beiog driven by compressed air necessitates its use, and for this reason is preferred by many engineers.—Machinery.

TIN IN BURMAH.—The tin-bearing deposits in Burmah are, according to Mr. H. Warth, of the Government Central Museum, Madras, of two kinds. First, there is the tin gravel which is found in all or most of the valleys, a mixture of rough, white-quartz pebbles with sand, garnet, black tourmaline and gray cassiterite. The thickness of the gravel varies from one foot to six feet, and the yield of cassiterite may be put down as at least one-fourth per cent or one pound of cassiterite—tin dioxide—in 400 pounds of gravel. There are washings going on at many places, but some valleys have been more or less exhausted. The work suffers also under the disadvantages that the greater part of the country is quite uninhabited, that food has to he brought from a distance, and that there is always danger of sickness. Chinamen are the chief workers. The second kind of tin-bearing deposit is the original eruptive rock, which is weathered so that it is possible to wash out the grains of whitish cassiterite which it contains. Mr. Warth visited the principal deposits of this kind near Malewun in July, 1891. The yield is only 0.04 per cent of impure wash tin.

Pyrites Mining in America.

The pyrites industry in the United States is rapidly becoming a source of increased interest and enterprise. In the matter of supply and economic possibilities, there is, says the *Age of Steel*, ample ground for generous operations and equally redundant returns. The principal sources of the world's supply have been largely confined to the mines of Spain and Portugal, the most important of which have been worked for centuries, the Celt, the Phœoician and the Roman being historic successions in exhuming the European pyrite. The Castilian operations have been more or less desultory political troubles, and the aggressive and pestilent Moor interfering with the steady development of the industry. The enterprise, however, of later years has been less intermittent, and its dividends of a gilt-edged and encouraging character. The distribution of this mineral in the United States, where native enterprise has more or less utilized a long-neglected source of wealth, includes the States of New Hampshire, Vermont, Massachusetts, New York, North Carolina, Tennessee, Georgia and Virginia. It is estimated that the mining of iron pyrites at its present output in the United States is a saving of $1,000,000 in the otherwise necessary importations. The present production compared with the demand is barely ten per cent.

The products of pyrite are its real commercial value. Of these the most direct and important result is sulphuric acid. This acid is multifarious in its applications, and its service in the chemistry of important products is of premier importance. In the manufacture of artificial fertilizers it is practically indispensable. These are in increasing demand in exhausted soils, and in large areas of land where normal conditions are unfavorable to fertility. For this latent deficiency the phosphate-rock industry is simply a response. This phosphate is decomposed largely by sulphuric acid, and to such an extent that the amount of acid demanded by this industry approximates one-half of the total production of the country.

In the refioement of crude petroleum this chemical deduction from the iron pyrite is equally available, and when one cnnsiders the enormous output of the petroleum industry, amounting at present date to an annual tally of not less than $50,000,000 barrels, the importaoce of the pyrite can be readily perceived.

In the manufacture of paper, explosives, alkalies and other articles of every-day use, sulphuric acid is of general and indispensable service. As indicating its utility in commercial and industrial uses, consumption has increased from ahout 40,000 tons in 1865 to an estimated amount of 1,000,000 tons in 1891. The more general use of American pyrites in this manufacture has been postponed for various reasons. The domestic source of supply has heen uncertain, while the necessary and expensive change in plants has been an economic hindrance. Supply, however, is no longer a question of suspense, while the inducements to manufacture are nullifying the objections to the added cost of improved plants. As demand increases and available resources of material are secured, the iostallation of the iron pyrite as a commercial factor in American industry will be of constructive and increasing importance. It is not likely, hut in fact is impossible, that so valuable an auxiliary to natlonal wealth will permanently suffer from neglect or obscurity.

The Geographical Society of California.

Our predictions with regard to the progress of this enterprising Society have been verified. Its membership has now reached 400, with the prospect of a considerable number of accessions by the close of the year. The directors seem to have been indefatigable, and at the same time fortunate, in securing good lecturers, whose addresses have been above the average, such as have succeeded those previously announced by us being: "A Neglected Naturalist, Constantine S. Rafinesque," by the Society's president, Prof. David Starr Jordan; "An Hour or So in Mexico," by E. McD. Johnstone; "Our Navy and Coast Defenses," by Capt. W. E. W. Campbell; "The Sunrise Century" (the geography of the future), by the Rev. Horace M. Du Bose, D. D.; "The Malay Archipelago," by Capt. Henry C. Everill; and "Among the Samoans," by Thos. Crawford Johnston.

These, with that of December 5th by Dr. Fred W. D'Evelyn—subject, "Terra Natalis"—make 14 lectures this year. The special bulletin we referred to in a previous article, containing a remarkable paper by Thos. Crawford Johnston entitled "Did the Phœnicians Discover America?" has been published and has created considerable sensation, owing to the novelty of the theory and the great amount of painstaking, research and perseverance displayed by the author. We understaod that it is the intention of the society that this bulletin shall be followed oo the 1st of January by its first ordinary one, which will contain a selection from the lectures given under its auspices up to the present time.

The Board of Directors has been reinforced by an Honorary Council composed of Col. Chas. F. Crocker, Stephen T. Gage, H. E. Huntington, Prof. Martin Kellogg, Col. Geo. H. Morrison, G. Howard Thompson, Edwin Fretwell, A. S. Hallidie, Col. J. P. Jackson, Hon. E. McKiostry, John Rosenfeld and John J. Valentine.

To Determine What Is Mineral Land.

The Condition of Affairs in Northern California

SHASTA, Shasta Co., Cal., Nov. 28, 1892.

TO THE EDITOR:—The late Miners' Convention in San Francisco suggested that Congress might take the necessary steps to determine definitely what is mineral land and what is agricultural. I wish to show the necessity of such a movement being made as soon as possible. The mountainous portions of Shasta, Siskiyou and Trinity counties have about all been returned as agricultural land in the railroad grant. Hundreds of miners are at work extracting gold, silver, copper and lead from these mountain lands. There has not been mineral land enough returned as such to furnish each quartzminer now at work with one-half the land in a quartz-mine location.

This estimate is taken from the field notes and maps on file in the United States Land Office in Redding. This, then, is what land is open for the miner to explore and locate under the United States Land Law.

When a prospect is found on an odd section, it must be purchased from the railroad company, as no miner should develop a prospect without some surety of title. While the miner is working the property any person can purchase the railroad quitclaim deed to the same. This deed conveys no title, but does convey the money to the railroad company, and just enough law to dispossess the miner and that law was obtained by fraud.

The general reputation of the Southern Pacific Railroad Co. is, that it looks carefully after its own interests without regard to the rights of others. Their grant did not give them mineral lands. Pursuant of their interests, almost no land was returned as mineral within the limits of said grant. A well planned scheme! An examination of the maps on file in the Land Office will show how well it was carried out.

The writer has knowledge of sections of land north of Redding sold hy the railroad company as agricultural, on which there is not an acre that can be cultivated or produce farm products.

The railroad company obtained possession of this land north of Redding by what is known as the Railroad Forfeiture hill, passed by Congress.

This bill, however, did not forfeit, but restored to the company 60 miles wide of land to which they were not entitled, because of failure to build the road within the time stated in the grant, and for the further reason that it is mineral land, not one acre in 500 being fit for cultivation.

On the land restored to them no taxes are paid, but individuals purchasing land from the railroad company must pay taxes on the same.

If this is law it certainly does not belong to a republican form of government. Land under like conditions is taxed to the individual and not to the corporation.

Many miners have filed mineral affidavits on these odd sections, intending to contest before the United States Land Office when the railroad company makes application for patent, expecting to prove that the land is more valuable for mineral than agricultural purposes.

If that was all that was required it could be done, but it is not. The miner must prove he is familiar with each and every one of the smallest legal subdivisions of the section, and that there is a paying mine on each—this is impossible. He might save some of the subdivisions, hut it is doubtful.

The miner must have money to carry on this contest. The very singular laws and rulings under which a contest is carried on make it more necessary for the miner to have money than right and justice. The railroad company sells this land either for cash or on the installment plan, one-fourth cash and one year's interest in advance; then sends a contract for the miner to sign. And what a contract! The instrument appears to have been copied from the peon contract in force in New Mexico about the year 1860, with all the arts, devices and dodges learned from that day to this. In the peon contract a man was allowed his immortal soul after it left the body, hut in the railroad contract there is no limit to the claiming of rights. The trouble lies in the wrong and fraudulent classification of land, which was not made under the law but by trickery.

The quartzminer does not want one acre of land that a farmer can use for farming purposes, hut he does want what is mineral in kind and character and unfit for agriculture. There is classified swamp land, timber land, farming land, school land, hut little or almost no mineral land in the north end of this State.

The remedy is for the legislature of this State to call the attention of Congress to this wrong and have the land reclassified. Miners in each county should see how their land is returned; if mineral in character, that it is so classified, else mining cannot he successfully carried on in the face of so many difficulties. The laws and rulings are not in his favor, and to establish his claim on other than mineral land is almost impossible.

The United States surveyors have returned the summits and sides of about all the mountains in northern California as agricultural land. On this same land hundreds of miners are now at work, with no defined law under which to bold claims.

It is just as much trouble to locate mining claims on Government or even sections as on the railroad sections. On even sections he must have a paying mine to establish claim; a good prospect will not do.

On this matter reference is made to decisions of the land department at Washington. An examination of this land and a reclassification must he had before the quartzminer will have a right to pursue his occupation, only in a limited way. The peculiar manner the Southern Pacific Railroad Company has of doing business is becoming about as well understood as the tricks of the heathen Chinese. It sells sections of this mineral land without regard to how many miners occupy it; the one purchasing and the miners whose claims are on the ground can either fight or law for possession; this is no concern of the railroad company.

Let us hope the legislature will call upon Congress to remedy this injustice. J. E. BELL.

Acknowledgement and Reminiscence.

SAN FRANCISCO, Dec. 5, 1892.

TO THE EDITOR:—It is always gratifying to he appreciated; hence I take pleasure in acknowledging the graceful compliments of your correspondents, F. A. Garbutt and "M. H. B." The apparent immediate cause of the last named gentleman's tribute, however, is hardly worth the attention it has received. It takes all sorts of people to make a world, and the "James Smiths" are one sort. Moreover, it is good for us to "see ourselves as others see us," from different points of view, and old Æsop taught long ago the futility of trying to please everyhody. In truth, the narrow intelligence which can discern in the MINING AND SCIENTIFIC PRESS a *newspaper* only, is no more worthy of serious consideration than is the moral obtuseness which permitted to Mr. Smith the indelicacy of expressing his sense of disgruntlement to me, instead of to you, to whom was addressed the subject of his plaint; to you, who are alone the judge as to what is appropriate to the columns over which you so ahly preside, and alone responsihle for what may appear therein; for these reasons I ahstained from resenting what some might deem an impertinence.

My connection with this paper dates back more than a quarter century, and during all that time my relations with the proprietors and editors have been marked hy uninterrupted cordiality and mutual esteem. In the earlier years my writings were perhaps not remarkable for a "total lack of dogmatism;" that comes, or should come, with age and reflection. I was one among about a dozen contrihutors of whom I seem to be the lone survivor. Some of them have passed over to the majority; some seem to have retired permanently from the field, perhaps wisely, for, as one of the brightest, who went to his long home in the sixties, said to me, "A man who is fool enough to write for the public press must expect to be held responsible, not only for what he says hut also for what every idiot thinks he means." For my part, I write from a variety of motives, among which are, a love of the "art or trade" by which I have made a living these many years. If I do not give *quid pro quo*, which, for the benefit of friend James, I will say is equivalent to "a hlack dog for a green monkey," it is not from any desire to "steal an ad."

Many a sharp cut-and-thrust have I had in these columns with belted knights of the profession, who had oot the cue to cry "bodkin" to me;* and, after all, what does a piece of sheepskin signify? Simply that the owner did once know something! It does not prove that he has not forgotten, as Mr. Brown, the only man who ever knew it, unfortunately forgot what animal magnetism was, to the great disgust of his professor and his class; nor does it show that he has kept up with the march of science since the sheepskin was granted. Moreover, as Horace Greeley said of the runaway slave, "If he can pass for a white man, by God, sir, he *is* a white man!" These remarks necessitate another, to guard against erroneous inference, bane of the public writer. I am far from despising a diploma; it is at least *prima facie* evidence of qualification; I merely mean to say that a record of achievements in the field should he, and often is, admitted as an equivalent at least.

One hattle royal in particular I remember; it is not very many years ago. Sir George of the Delta, one of my dearest foes (and friends), aod myself made an unconcerted hut simultaneous denunciation ol a certain Patent which the sovereign of this country had granted to a knight called Sir Otto of Tarshish, as a reward for having vanquished in single combat a hydra-headed metallurgical monster in the country of that name. Sir Otto not being returned yet, his uncle, old Sir Guido, espoused his cause and, taking up the gauntlet, made a vigorous though rather ill-directed charge upon us. Sir George, seeing that we were two to one, retired, showing his high sense of the obligations of chivalry, as well as his confidence in my ahility to maintain the cause whicb we deemed righteous. After a couple of lively bouts hetween Sir Guido and your servant, in which neither side suffered much harm, Sir Otto, coming down from Tarshish, hearing the clash of arms and seeing his uncle sore put to it to hold his ground, at once took the elder knight's place and made a very potent onslaught, calling forth all the skill and valor of his opponent, even though Sir William of Ireland attempted a diversion hy skirmishing "on the side," on account of a grievance he had against Sir Otto, who had given him a poke in the ribs *en passant*.

At this juncture appeared upon the scene, coming to the aid of Sir Otto,

> "A warrior stout and tall;
> None could tell his name nor lineage,
> None could meet him in the field,"
> And the symhol, *Metallurgist*,
> Blazed upon his burnished shield,

And this nameless knight did such pithy and pungent work with his good lance that my hanner was humhled to the dust, and the cause I had defended was utterly lost. Sir Otto was naturally elated, and in his song of triumph gave due praise, as in honor hound, to his timely ally, the stranger knight. It was a little mean of me, I freely confess, hut I could not resist the temptation to reveal my identity with that nameless warrior.

It came about in this wise: As I lay one night in hed, instead of attending to the legitimate husiness of horizontal life, which, as I take it, is sleeping, I was turning over in my mind the suhject of my contention. As thus I revolved the matter, I caugbt sight of an aspect which I had not before observed, and, on meditating profoundly, decided that it was the proper aspect, and that I had been fighting an unholy fight. Now, Sir Otto had by no means tumbled to this weak spot in my armor, and I had parried or forestalled every attack so far; therefore I would not yield me captive to *his* spear, and yet as a true knight at heart, though not duly "dubbed," I could no longer sustain an unrighteous cause to the detriment of knightly honor and the prejudice of truth, so I took the only alternative and, disguised as the nameless knight, turned my arms against that which had been my cause and shared the glory of the victor. I fear Sir George of the Delta never quite forgave what seemed to him like treachery, but was in fact only loyalty to truth as I saw it.

Friends and foes of the old time and of tbe present, may Peace dwell in your tents! The time is not far distant when my voice also will be "heard to cease." Meanwhile, I shall go straight on, unmoved by M. T. pretensions or the "slings and arrows of outrageous" impudence, ever strenuously striving toward the unattainable goal of each true knight of Science or Art—*Pure Truth*.

C. H. AARON.

* Vide—The Abbott—Waverly Novels.

Where, O Where, Is He?

TO THE EDITOR:—My former letter about the cyanide process has been pretty roughly handled one way or another. That's all right, hut I am staying with the pot all the same.

I said I would believe in the process when I should see an honest miner made rich by working it, or having it worked for him. Now, that's a good while ago. I have heard lots about what people were going to do, but, I ask, respectfully, where is the man who has made any money out of the thing, barring hired men and sellers of rights.

Mr. C. H Aaron keeps firing away, but it seems to be all blank cartridge, and he can't make any bull's-eye that way. I notice he doesn't say a word about having worked any ore. Mr. Merrill, who is a "'varsity man," and our old friend Louis Blanding, and many others have had their say, and it all makes very nice reading for them that understand it, hut it seems to me there's a lack of the most important thing, which is, economic statistics of practical working. We fellows in the mountains have a saying, "Talk's cheap, but it takes money to buy whisky." But really it's a little hard sometimes to know whether Mr. Aaron is fish or fowl. At one time he seems to praise the process, and then again he finds fault with it. Well, I guess he knows what he's playing for. Perhaps he's on the fence, waiting like me for more light, though I stay on my side of the fence till I see something to climb over for.

Mr. Paul has not had much to say of late, and I notice that, for one reason or other, his mills do a good deal of stopping. If any one can tell us anything really valuable about the practical results of the process in this country, Paul is, or should be, the man. The Mercur mill is rather too far off and too much in with the Denver Co.; moreover, there are some who believe the reports from it to be "cooked." Small tests on a few pounds, or even a ton of ore, such as some gentlemen report, don't go for much with any PRACTICAL MINER.

P. S.—I hear that certain merry gentlemen have an itching to punch my head, if they can find me. Well, that used to be my trade, hut I'm getting old now and, like many others, I make a virtue of necessity and cultivate the ways of peace. Still, like the great ex-champion John L., "I can lick any man, if he will only stand still;" and, I will add, I can kiss any girl on the same condition.

AT times some difficulty is experienced in securing first-class mechanics under the operations of civil service, as such do not seem to regard a job at Mare Island Navy Yard worth the trouble necessary to register, as required by law, according to their trades. The only requirements for registration are that they shall be American citizens, and that they shall bring certificates from previous employers that they know their trade. The Board of Labor Employment at the Mare Island Yard consists of three officers, to-wit: Captain H. L. Howison, Chief Engineer George J. Burnap, and Lieutenant Daniel P. Menefee, recorder. When workmen in any particular trade are needed in any department of the yard, the head of the department makes a requisition on the board for the number required. The board then sends in a list of names, taking them in the order of their application, but giving preference first to veterans of tbe war, next to those having served apprenticesbip in the yard, then those having had experience in navy-yard work, lastly, those who have never worked at a naval station. The head of the department, on receiving tbe names from the board, takes the same course that would be followed by a superintendent in a private establishment. He sets the men at work and finds out their fitness for employment, grading them accordiog to their skill, if they are first-class men, if they are not rejecting them altogether. Every man who is sent to a department must be given a fair trial. If they do not come up to tbe standard they are sent back and a new set of names are sent in. The foremen have little or no jurisdiction in the selection of their men, though they have to judge upon the qualifications of those sent them.

THE South Yuba Canal Company has been quietly soliciting among the mines of Nevada City and Grass Valley, bidding to put in electrical power within three months. There promises to he a lively contest for the furnishing of power in that section before long, and the consumer may hope to get the better of it. Work on the Tregidgo electrical proposition is progressing favorably. The dam is about completed and capahle of withstanding the winter floods. This was the part of the work they were most solicitous of completing at an early date.

THE Florence, A. T., canal and all rights will probably be sold to a strong syndicate possessiog ample capital to develop to its fullest extent the water supply of the Casa Grande valley.

Mechanical Progress.

Horse Power of Boilers.

It is a very common thing to hear men connected with steam plants speaking of the horsepower of their boilers, yet if they were asked to define what they meant by horsepower of boilers, there is no doubt but many of them would suddenly discover that it was somewhat difficult to define clearly just what they did mean, and for a very good reason. Strictly speaking, says the *Wool and Cotton Reporter*, there is no such thing as horsepower to a steam boiler, and in consequence the term horsepower of a boiler is a very vague expression. But as boilers have been found so far a necessity in driving steam engines, the same measure applied to steam engines has come to be universally applied to the boiler, and like a good many other such accidental definitions, cannot very well be discarded.

The unit of horsepower for boilers is not fixed except by arbitrary agreement among the parties concerned, the basis differing according to the nature of the work done by the steam. Many boilermakers rate the horsepower of the boilers by the number of square feet of heating surface contained in the boiler. Although this rule is followed by many, it is no criterion as between different styles of boilers—a square foot under some circumstances being many times as efficient as in others; but when the average rate of evaporation has been fixed upon by experimenters in one boiler, there is no more convenient way of rating others of the same style. But by an outsider no exact rating of a boiler can be made from a knowledge of only its heating surface.

The following rules are observed in a good many boiler shops, and may be useful: For cylinder boilers nine square feet of heating surface per horsepower are allowed, for fine boilers 12 square feet, and for tubular boilers 15 square feet of heating surface per horsepower. Hence, if the total heating surface be known, divide it by 9, 12 or 15, according to the type of boiler, and the quotient will be the horsepower of the boiler. If a boiler is tested and a statement of its horsepower desired, without regard to whether it is to supply its steam to drive an engine or for other purposes, then it is agreed upon by the majority of experts to consider 30 pounds of water per hour, evaporated at 70 pounds pressure from 100 degrees, as a horsepower.

A standard was fixed by Watt at one cubic foot of water evaporated per hour from 212 degrees for each horsepower. This was at that time the requirement of the best engine in use. Most nations have a standard similar to and generally derived from Watt's horsepower, but owing to different standards of weights and measures, these are not identical, though the greatest differences amount to less than 1½ per cent.

Oil Motors for Launches.

Quite a large field has been opened out during the past few years for the employment of oil-engines for various purposes. Among such applications may be mentioned those for driving dynamos for electric lighting and general motors, or for mining and marine purposes. Since the first successful petroleum engine was introduced, some time ago, a very large number has been adopted, and this type of motor now constitutes a formidable competitor to the gas-engine. Probably this is due not so much to the actual cost per horsepower hour—which may be taken as approximately the same in either case—as to the fact that the oil-engine can be operated where the nonexistence of a supply of gas precludes the employment of a gas-engine. This is specially the case in many country districts, both at home and abroad, where petroleum is frequently the only available means of obtaining light and heat.

The Priestman oil-engine was the first—at least in this country—to be applied for the propulsion of launches, and this has been followed by the introduction of naphtha motors in Germany and Switzerland. In the former country the Daimler motor has been extensively adopted, and in Hamburg alone no less than 80 of these craft are running in and about the port. Refined petroleum is used in the Daimler, as compared with the heavy or crude oil employed in the Priestman engine. The Daimler motor is about to receive some prominence in this country, but in the meantime the Roots' gas-engine, which we described in a previous issue, has been developed. It is now equally applicable as an oil-engine, and, as such, one has been made, and has this week been tried in a launch on the Thames.

The trial was promoted by Messrs. Yosper & Co., of Portsmouth. The motor used weighed six hundredweight, developed something over three-horsepower, and drove the launch at a speed of six miles an hour. The novelty claimed for this engine consists mainly in the mechanical contrivances by which ordinary paraffine oil is converted into gas. A small reservoir containing two gallons of mineral oil, which is enough for a run of three hours at full speed, is attached to the engine. From this, one drop at a time descends through pipes to valves, into which heated air is admitted. The air and oil are forced into a space, which, by contact with the flame from another jet of oil is kept always at an even temperature. There the oil is converted suddenly into gas, and passes through a tube to the cylinder. By a system of compensating valves, on which a lever strikes, gas is admitted into each of two cylinders alternately, and the motion once begun goes on so long as there is a drop of oil left in the reservoir, unless it is desired that the engine should stop, and then the man in charge has it perfectly under control. At the trial the engine seemed to work efficiently. When it is desired to stop altogether, the propeller is thrown out of gear. Engines of considerably more power are in course of construction, but the idea at present is to adopt them simply for use in launches or boats of similar size.—Invention.

The Use of Steam Jets.

One of the most varied and successful applications of steam jets may be seen at a well-known mill in this city. After several years of use of natural gas, the owners were forced to return to coal. They found, however, that with coal their boilers would not supply sufficient steam. Accordingly, they concluded to try steam jets to increase combustion and evaporation. After some experimenting they finally adopted a jet somewhat of the Bunsen burner type, which is now in successful operation on two batteries of fine boilers—the jets being placed above the fire doors and immediately below the boilers. The fuel is slack, and yet almost no smoke is visible, even during heavy firing. The same firm has also applied to 18 puddling and four heating furnaces steam jets of a different design. In these the ash pit is made tight and the steam and air enter below the grates. These furnaces are of the usual type, except that special openings are made for air above the fire and through the bridge-wall. When the fire doors are closed no black smoke is visible while the steam jets are in operation. The smoke appears above the stack whenever the fire door is opened, but disappears immediately on closing the door. Each puddling furnace has two jets of steam and each heating furnace five jets, all about one-tenth inch in diameter. Not coal can now be used in the heating furnaces and slack in the puddling furnaces, whereas lump was used formerly in both. The jets have been in use nearly a year, and the millowners state that they have not injured the boilers nor the furnaces, nor the iron, but have saved money by reducing the quantity and quality of the fuel required. Unfortunately the steam jet makes a great noise. This is not very objectionable in a rolling mill or machine shop, but will probably prevent its introduction into office buildings where it otherwise might be useful.—Iron Age.

Asbestus Porcelain.

M. Garros is the inventor of a new substance, somewhat resembling ordinary porcelain, but which possesses, as he claims, many advantages over that substance. The fibers of asbestus are exceedingly fine, their diameter varying between .00016 millimeters and .0001 millimeters, and consequently an exceedingly fine powder can be obtained from these. If it were possible to amalgamate these small particles without the addition of any foreign substance, it is evident, says the *Electrical World*, that a substance could be obtained which would be porous in nature, but the pores so fine that they could hardly be seen under the microscope. This substance is formed by pulverizing the asbestus, a process which is rather difficult if the ordinary mortar is used, but which is comparatively easy when the proper apparatus is employed.

From this powder a paste is made by mixture with water, and this paste is kneaded, diluted with water, dried and kneaded again, and then molded into the proper form. By heating the objects in a crucible to a temperature of 1700° C., a porcelain is obtained with a translucency comparable to that of ordinary porcelain, and for this reason the inventor has given the name of asbestus porcelain to the substance. If it is heated for 18 hours at a temperature of 1200° C., then porous asbestus porcelain is obtained of a light yellow or white color if care is taken to wash the asbestus powder with sulphuric acid. Prof. D'Arsonval states that porous cups made of asbestus porcelain used in electric batteries have much less resistance than the ordinary porous cups, and it has been found that this substance is about 2.75 times a better insulator than the porcelain in common use at the time.

Scientific Progress.

The Science of Smelling.

Prof. De Volson Wood, of the Stevens' Institute Hoboken, N. J., contributes the following to *Science*: The greater part of the science of seeing is contained in the science of optics, and this is founded upon the theory of undulations of the ether and the way in which they are modified by the media through which they pass. The form of the surface, whether plane or curved, as well as the density of the medium, produces marked effects.

Similarly, the greater part of the science of hearing is contained in the science of acoustics, and this also treats of undulations, or waves propagated in air or other gases. It is not believed in either case that solid particles pass from a source to the sensitive nerves to produce the particular sensation.

Why should there not be a science of smelling? The principal part of such a science would consist of an investigation of the mechanical properties of odors, and might briefly be called "Odorology." Is it not highly probable that odors are also propagated by undulations of an ether? And yet we are familiar with the statements made by writers, such as "A grain of musk will keep a room scented for many years. During the whole of the time it must be slowly evaporating, giving out its particles to the currents of air to be wafted presently out of doors; yet in all this time the musk seems to lose but little of its weight." "The acute sense of smell of the dog is well-known; for he can detect the track of his master long after the tracks have been made, which shows that some slight characteristic matter is left at each footfall."

Those who thus speak impart the idea that odor is material. I prefer to think of it as a property of matter, which produces its own peculiar undulations; and that the sensation of odor is produced by these undulations in the olfactories. Musk retains this property for a very long time, while some bodies lose it rapidly. The man may leave some characteristic matter on the ground at each footstep, but it is not necessary that particles of that matter shall pass from the ground into the nose of the dog in order that he may track his master. It is only necessary that that matter shall possess the property of sending forth certain undulations. Indeed, it is not difficult to conceive that the ground itself has imparted to it the property of sending forth the desired undulations.

These facts being assumed, investigations might be made to determine the velocity with which odors are propagated, and whether they are subject to reflection, refraction, and interference, and other properties common to sound and light; also whether the different odors are due to different wave-lengths, and if the strength and intensity of the odor is due to the amplitude of the wave, as in light and sound. The physiological qualities of the olfactories by which they enable one to detect odors of different qualities and intensities, furnish a field for the most delicate and refined investigation.

The Value and Preparation of Magnesia.

Magnesia, formerly chiefly valued on account of its medicinal properties, has recently risen to great commercial importance, owing to its infusibility and its employment as a lining for converters used in the basic process of steel manufacture. Caron, whose process was in the first instance followed, used calcined magnesite. This was made up with one-sixth of its weight of tender-burned magnesia, and from 10 to 15 per cent of water, into a plastic state; it was then compressed into bricks in iron molds and burned at a dull-red heat. Professor Ehrenworth has pointed out that, if the refractory properties of the magnesia are to be evoked to the full, it is of the utmost importance that the whole of the magnesia should be dead-burned; the process, moreover, being carried so far as not only to expel the whole of the carbonic acid, but also to cause the full amount of shrinkage which this material is capable of attaining. This extreme amount of calcination is very difficult to effect, owing to the tendency of the magnesite to fly into splinters, and to drop to pieces when subsequently touched, and in consequence of its being such a bad conductor of heat the stone is very hard to burn in large pieces.

Recently dolomite, which is a double carbonate of lime and magnesia, has been used instead of magnesite. In order to prepare this material there are two processes before the public; that of Closson and that of Scheibler. Under the former plan, the calcined dolomite is mixed with chloride of magnesium, the chlorine in which separates from the magnesia and combines with the lime, yielding a soluble calcic chloride which can readily be washed out, leaving behind the insoluble magnesia. Under the process of Scheibler, the calcined dolomite is treated with dissolved sugar, leading to the formation of sugar of lime, and depositing the magnesia. The solution of sugar of lime is then exposed to carbonic-acid gas, which separates the lime as a carbonate, leaving the sugar ready for reuse. Both these systems of producing magnesia have the advantage of relative cheapness in their favor, owing to the low price of dolomite. Professor Frank of Charlottenburg has advocated the use of magnesia as a substitute for plaster of paris for casts; and Grundmann has recently shown the advantage of employing a mixture of magnesia and powdered marble for this purpose. The latter has found, following the direction given by Hirzel, that a mixture of benzol and magnesia is the very best possible substance for the removal of grease from drawings, or from any other material.—Iron.

THE PHONOSCOPE.—In a recent number of this journal was announced the fact that M. Dumeny had succeeded in taking instantaneous photographs of the lips of a speaker, and is recombining them in a sort of zoetrope, so as to reproduce the original movements, and enable a deaf mute to understand what was said. He has recently improved on the process, and invented a new apparatus for combining the images, which he terms a phonoscope. The changes of the lips in speaking are so rapid that 15 photographs a second are required to give a good result. Moreover, several sets of images for the same phase are taken, so that nothing essential should be omitted. The whole head and bust of the speaker is photographed, so as to get the benefit of the expression. In the phonoscope the positives are arranged around the periphery of a disc, which is rapidly turned by a handle. A second disc, having a single window in it just opposite the plates, is also rotated by the same handle, but at a much higher speed than the other. A beam of sunlight illuminates the plates from behind, and the observer, looking into the apparatus, sees them pass his eyes one after another in such rapid succession as to produce the effect of a single image endowed with animation. To this end, at least 10 or 12 must pass the retina in a second. M. Dumeny is so far satisfied with his results that he looks forward to a time when we shall possess veritable "speaking likenesses" of our friends. In short, the family album will be a kind of phonoscope, and contain photographs which will not only smile, but speak, or appear to speak to us, as though they were alive.—Machinery.

LEAD COATED METAL PLATES.—From the experiments thus far made, says an exchange, it would appear that the new process of coating iron and steel plates with lead is likely to inaugurate an important industry. The plates or other articles to be coated are first pickled in a bath to remove scale, and through this bath a weak current of electricity is passed, which is said to reduce the time required by one-third. From this bath the articles are passed, as usual, into another of lime water, which neutralizes the acid, and thence into a third of clear water; they are then immersed in a fourth bath, consisting of a neutral solution of zinc and stannic chlorides, obtained by dissolving granulated zinc and tin in hydrochloric acid; and from this bath they are passed into a drying chamber, heated by steam, where the moisture on them from the last bath is evaporated, leaving behind a deposit of the mixed metallic chlorides, which protects the plates, etc., from oxidation, and, when dried, these plates are ready to be placed into a bath of molten lead. On issuing from the bath, the plates are found to be coated with a uniform and very adherent layer of lead, and, though perfectly uniform, the layer is nevertheless very thin. The ductility and strength of the iron are not diminished by the process, and a plate can be bent and closed, and again opened out, without breaking the coating. In the case of galvanized iron, bending the plate to a sharp angle causes the coating to crack.

NEW AND CHOICE

PRACTICAL BOOKS

JUST READY.

BRANNT.—The Practical Scourer and Garment Dyer. Comprising Dry or Chemical Cleaning; the Art of Removing Stains; Fine Washing, Bleaching and Dyeing of Straw Hats, Gloves and Feathers of all kinds; Dyeing of Worn Clothes of all Fabrics, including Mixed Goods, by One Dip, and the Manufacture of Soaps and Fluids for Cleansing Purposes. Edited by William T. Brannt, Editor of "The Techno Chemical Receipt Book." Illustrated. 200 pages, 12mo. Price.....$2.00

LIEBER.—The Assayer's Guide; or, Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the Principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber. A new, revised and enlarged edition. Illustrated. 583 engs. 12mo. Price.....$1.50

DUNCAN.—The Practical Surveyor's Guide. Containing the necessary Information to make any Person of common capacity a Finished Land Surveyor, without the Aid of a Teacher. By Andrew Duncan, C.E. New, revised and enlarged edition. Illustrated by 72 engravings. 214 pages, 12mo. Price.....$1.50

RECENTLY PUBLISHED.

DEITE.—A Practical Treatise on the Manufacture of Perfumery. Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentrifices, Cosmetics, etc., etc.; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. Deite, assisted by L. Borchert, F. Eichbaum, E. Kugler, H. Toepffner, and other Experts. From the German by William T. Brannt, editor of "The Techno-Chemical Receipt Book." 28 engravings. 12mo, 358 pages. Price.....$3.00

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. From the German of Dr. George Langbein. By William T. Brannt. 125 engravings. 8vo, 404 pages. Price.....$4.00

LARKIN.—The Practical Brass and Iron Founder's Guide. A Treatise on Brass Founding, Molding, the Metals and their Alloys, etc. By James Larkin. A new revised and greatly enlarged edition. Illustrated. 12mo, 400 pages. Price.....$2.50

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hektograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks, Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stamp and Stencil Inks, Wash Blue, etc., etc. From the German of Sigmund Lehner, Chemist and Manufacturer, by William T. Brannt. 12mo, 230 pages. Price.....$2.50

OSBORN.—The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines and Mining." 44 engravings 12mo, 175 pages. Price.....$1.50

WAHNSCHAFFE.—Guide to the Scientific Examination of Soils. Comprising Select Methods of Mechanical and Chemical Analysis and Physical Investigation. From the German of Dr. Felix Wahnschaffe. With additions by William T. Brannt. 25 engravings. 12mo. 177 pages. Price.....$1.50

BRANNT-WAHL.—The Techno-Chemical Receipt Book. Containing several thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and Industries. Edited by William T. Brannt and W. H. Wahl, Ph.D. 78 engravings. 495 pages, 12mo. Price.....$2.00

BRANNT.—The Metal Worker's Handy Book of Receipts and Processes. 63 engravings. 536 pages. 12mo. Price.....$2.50

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing Rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers; Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for everyday use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. 296 pages, 12mo. Price.....$2.50

VAN CLEVE-EDWARDS.—The English and American Mechanic. An Every-Day Handbook for the Workshop and the Factory. Containing several thousand Receipts, Rules and Tables, indispensable to the Mechanic, the Artisan and the Manufacturer. By B. Frank Van Cleve and Emory Edwards, C.E. 85 engravings. 500 pages, 12mo. Price.....$2.00

EDWARDS.—600 Examination Questions and Answers for Engineers and Firemen (Land and Marine): Who desire to obtain a U. S. Government or State License. By Emory Edwards. Pocket book form, gilt edges. 128 pages. Price.....$1.50

EDWARDS.—The American Marine Engineer. Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards. Illustrated by 85 engravings. 440 pages. Price.$2.50

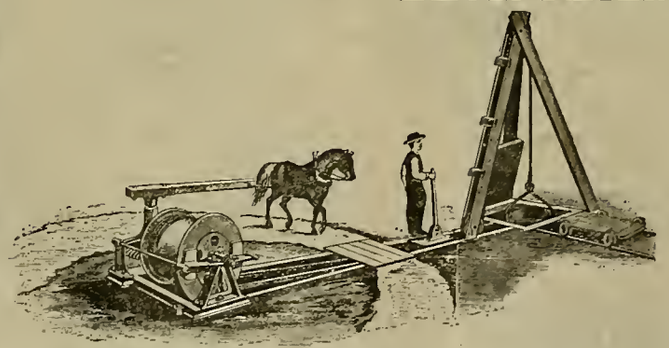
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

RUPTURE,

PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD PRIVATE AND CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSSY, 833 Market Street, San Francisco, Cal.

Electricity.

Electric Street Railways.

The following abstracts from the report of the committee on "A Model Electric Street-Railway Roadbed and Underground Wiring," which was made at the recent Cleveland convention, contains valuable information worth keeping for reference:

We bave heard of instances being cited where copper wire laid nnderground was more susceptible to electrolysis than that of galvanized iron or steel; but after a thorough trial of upward of three years, during which time we bave used botb, the conclusion reached is that copper, being not only a better conductor but less liable to corrode and break, is therefore the best wire to use for underground work. Galvanized soft steel or iron wire used for this purpose had not proved durable, and we have found the same to be entirely eaten away by electrolysis where it had come in contact with the crosstie, and in perfect condition elsewhere.

By careful examination of the ampere meter at the powerhouse during dry weather, compared with that of rainy weather, it will be noticed that tbere is a marked decrease in the amount of current used in favor of the latter; hence i: follows that the more connections to the rail and the opposite poles of the generator with the moist earth the more economically is the system operated. It must also be remembered that the increased saving in current in wet weather over that of dry weather is not attributable to the increased moisture of the eartb alone, but to the fact that the dust and dirt, which readily finds lodgment on the rail, is washed off, and many roads now in operation by electricity have found the use of a car equipped with a tank having one down-spout, about ⅝ inch in diameter, on each side, so arranged as to permit a stream to flow over the head of each rail, most advantageous. These down-spouts should be located as near the wheel as possible, in order to insure the same being directly over the rail at all curves, as well as the straight track.

The mistake is sometimes made in designing and equipping a new road, or in changing from animal traction to electricity, of neglecting the track construction by appointing the amount to be thus expended to such a sum that, in order to make both ends meet, it becomes necessary to weaken that portion of the investment where, above all others, strength and permanency are required.

The switches, or cross-overs, should be located at such points along the route as will best provide for the following contingencies: bunching cars for large gatherings, and to insure the constant operation of cars during fires, parades and all other blockades when, from any cause, the terminus of the road cannot be reached. They should never be placed with the switch point against the traffic, and, preferably, on up grades, thus enabling cars to cross to the opposite track by gravity.

The fact should be borne in mind in the selection of cross-ties, not only to keep in view the selection of such timber as is calculated to insure the longest life, but due consideration should be given to the particular kind that will best hold the spike; and for this reason the white oak possesses advantages that should merit its consideration.

The requirements of a rail for electric traction are strength, joint connections, durability. In some localities there are municipal requirements specifying what the head of the rail shall be.

For strength we rely chiefly on the weight of the rail and the thickness and depth of the web.

For joint connections that rail which affords the best method of keeping both ends of the rail in perfect alignment is the best, and as the girder rail possesses peculiar advantages in this respect its almost universal adoption is due to that fact.

For durability we depend on the height of the head of the rail at the gauge-line over the lower flange, and the quality of the metal.

Electric Riveting.

Electricity has come into play in about every branch of mechanics, and it is not surprising that riveting by electricity is a success and an important improvement in the industrial arts. The apparatus consists of a transformer, the primary of which is formed of a heavy copper bar laid parallel to a coil of fine wire, and over the two are clamped angular segments of iron, forming when united a completed iron shell, increasing by this arrangement the efficiency of conversion. The structure creates a current of great volume in the copper bar, and in the end of this bar are mounted an anvil (having a regulating screw for moving it up or down) and a follower provided with a screw. In the circuit of a primary is placed a choke coil provided with a regulating switch for cutting in more or less of the coil by which the strength of the current induced in the secondary may be controlled.

Tbe bars or pieces of metal are placed upon the anvil and the rivet dropped in place, the anvil being tben screwed up until the plates of metal are firmly held between it and the two insulating legs secured to the upper limb of the copper bar. The face of the bar is covered with insulating material, except at a central point where it is left bare; and when forced against the rivet, the latter establishes connection from the upper limb or the primary bar to the lower limb, the current developing sufficient heat to make an upsetting of the rivet shank very easy under the pressure of the screw.—American Manufacturer.

Storage Batteries.

The secondary battery absorbs and stores energy electrically transferred to it.

The passage of a current of electricity through the dilute sulphuric acid between the plates of a secondary cell decomposes that liquid into its constituent elements, oxygen and hydrogen. In this manner the positive plate or plates become oxidized and the negative plates hydrogenized, the capacity of the oxygenation being equivalent to the storage capacity of the secondary battery. When pure lead is employed for the electrodes the process of oxidizing is very slow before an appreciable return can be obtained, and the cells bave to be frequently reversed in charging to make the positive plates spongy by hydrogenizing them, so tbat the degree of oxygenation may be great at the next reversal and the capacity of the cell increased.

This process is called "forming" and when completed the accumulator so made is more satisfactory than when an oxide is used in the form of a paste. Red lead, or litharge, are the usual oxides of lead that are employed. It is pressed in the form of paste into a grid, or frame, several of which area arranged alternately and coupled in parallel within a water-tigbt box to form a cell. The storage capacity depends upon the area of the lead surface immersed and the internal resistance upon the distance that separates the plates. The internal resistance is reduced by placing the plates closely together, using strips of glass, or other insulating material, to separate tbem.

Tbe process of forming is considerably curtailed when there is an oxidized and spongy surface to start with.

Recharging a completely discharged accumulator produces no other visible effect than to slightly disturb the liquid; but when tbe storage capacity is nearly attained bubbles are freely given off, caused by the evolution of hydrogen gas. A discharged accumulator should be immediately recbarged, as the sulphate of lead formed by the action of the sulphuric acid upon the nonactive surface of a discharged cell is injurious.

Unitarian Literature

Sent free by the CHANNING AUXILIARY of the First Unitarian Church, cor. Oeary and Franklin Sts., San Francisco. Address Miss S. A. Hobe, as above.

NOTICE OF ASSESSMENT.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meetiog of the Board of Trustees, held on the 22d day of November 1892, an assessment (No. 70) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the TWENTY-EIGHTH DAY OF DECEMBER, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of January, 1893, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

SITUATION WANTED.

Young man desiring change would like position as Superintendent for some mining company in one of the Spanish-American Republics. Large practical experience in mining and milling ores. At present in charge of one of the largest concentrating and leaching plants in Mexico. Fluent in Spanish. References. For particulars and address call on or address

MRS. M. J. C.,
226 Sutter St., San Francisco, Cal.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $6. Inserted in Dewey's patent binder, 50 cents additional per volume.

Professional.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco
Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION—JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Malthine M'f'g Co.
FACTORY:
Cor. Jefferson & First Sts., Oakland, Cal.
MANUFACTURERS OF
ACID, ALKALINE AND WATER-PROOF PAINTS,
Superior to anything of tha kind in the market for
IRON, WOOD AND TIN.
Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for
RANCH AND CITY,
AND UNEQUALED FOR
Teredo-Proof Pile Covering.
This Company also Manufactures a Maltnine Compound for
RENDERING BOOTS AND SHOES WATERPROOF.
The same is a superior article for Preserving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.
Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

PRACTICAL TREATISE ON HYDRAULIC MINING.
By AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, post-paid. For Sale by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

MINING AND SCIENTIFIC PRESS.

DEWEY & CO.'S
Scientific Press Patent Agency.
ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Useful Information.

Value of Magnesium as a Source of Light.

Mr. Frederick J. Rogers, as the result of what he terms a series of patient investigations, summarizes his researches in respect to the above as follows: (1) The spectrum of burning magnesium, as has already been pointed out by Pickering, approaches much more nearly that of sunlight than does the spectrum of any other artificial illuminant. (2) The temperature of the magnesium flame, about 1340° C., lies between that of the Bunsen burner and that of the air-blast lamp, although the character of its spectrum is such as would correspond to a temperature of nearly 5000° C., were its light due to ordinary incandescence. (3) The "radiant efficiency" (the ratio of luminous energy to total radiant energy) is 13½ per cent, a value higher than that for any other artificial illuminant (excepting, perhaps, the light of the electric discharge in vacuo, for which Dr. Staub, of Zurich, has found an efficiency of about 34 per cent). (4) The radiant energy emitted by hurning magnesium is about 4630 calories per gramme of the metal hurned, or 75 per cent of the total heat of combustion, as compared with 15 per cent to 20 per cent in the case of illuminating gas. (5) The thermal equivalent of one-candle power minute of magnesium light is about 2.5 lesser calories, as against 3.5 to 4.0 for other artificial illuminants. (6) The total efficiency of the magnesium light is about 10 per cent as compared with a quarter of one per cent for illuminating gas. (7) Taking into consideration the greater average luminosity of the rays of the visible spectrum of the magnesium flame, it is certain that per unit of energy expended, the light-giving power of burning magnesium is from 50 to 60 times greater than that of gas. —Engineering and Mining Journal.

The Care and Cleaning of Marble.

Marble, which is much less used than heretofore, has fallen somewhat into disfavor because of the difficulty of keeping it in order. It will become stained and spotted, and the average housekeeper seems not to understand how to put it in proper condition.

Grease spots are especially disfiguring, and stains are given up as hopeless. The first step in cleaning marble is to wash it thoroughly with clean water and a soft cloth. Every particle of dust, dirt or gumminess should be removed; then for the treatment of stains there are various methods. Some strong acids will remove such, but they are dangerous to use, as they will eat holes in the marble by dissolving the elements of which it is composed. Paint may be removed by pouring a quantity of chloroform over the spot and holding it in place by a thick cloth of linen or cotton.

It is said that blotting-paper saturated with chloroform laid over paint spots will absorb them, at least will so dissolve the ingredients that they may be washed out by sopping them up with the cloth and water. When the colored particles are taken out the oily portion is quite likely to come with it. If not cleaned, apply more chloroform.

Almost hopeless-looking paint stains have been entirely removed in this way without leaving a spot. If the marble is only ordinarily soiled or discolored, make a paste of common baking soda and water. Spread it thickly over the marble and allow it to stay for some hours, covering it with a damp cloth so that it will not dry too quickly. Leave it on over night; the next day wash thoroughly with clean water and polish with a bit of old wool-cloth or felt.

If marble is carefully washed once or twice in a month it rarely becomes dull or spotted unless by some accident, but when neglected it seems to grow spots, and becomes gray, and loses all of its brilliance and fine finish. —N. Y. Ledger.

PUMICE STONE.—We often hear it remarked, and particularly after the eruption of a volcano, that pumice stone ought to be plentiful and cheap, as quantities must have been ejected during the volcanic disturbance. As a matter of fact, however, none of the white stone in general use is obtained from active volcanos. It comes from deposits of the article discovered in one or two quarters of the globe, the best of which is at present to be found in the island of Lipari, situated in the Tyrrhenian sea. The island is mountainous in character and consists of tufa and lavas and highly siliceous volcanic products. The district where the stone is found is called Campo Blanco or Monte Petalo, 1500 feet above the level of the sea. After riding a considerable distance, partly along precipitous paths sufficiently dangerous to be interesting, and partly through vineyards and over grassy plains, one almost suddenly comes upon a seemingly snowclad narrow valley, inclosed by hills, also quite white, and the whole glaringly bright on a sunny day. Into these hills workmen are ceaselessly digging deep burrows, working within by candlelight. In their excavations they come across many lumps of pumice stone which are placed in baskets, subsequently being conveyed along the valley to the seashore, where small boats are loaded and sailed to the seaport near by, where the stone is sorted, packed and shipped to distant parts, either via Messina or Leghorn.—Builder and Woodworker.

Wages in Europe.

Blacksmiths receive $9.62 per week in England, $4 in Germany, $5.81 in France, $5.38 in Belgium, $3.18 in Austria. Carpenters receive $9.75 in England, $4.11 in Germany, $6.20 in France, $4.07 in Belgium, $5.10 in Austria. Cabinet makers receive $6 22 per week in England, $4.25 in Germany, $6.14 in France, $5.66 in Belgium and $4.40 in Austria. Machinists receive $9 per week in England and $4 60 in Germany—no figures at hand for France, Belgium and Austria. Painters receive $8.92 per week in England and $4.82 in Germany—no figures as to other countries. Laborers, $5.29 per week in England, $3.11 in Germany, $3.93 in France, $3.77 in Belgium and $3 in Austria. Printers are paid 20 cents per 1000 ems in England, and receive $6.64 per week in France, $5 94 in Belgium and $3.95 in Austria; bricklayers, $7.75 per week in England, $4.21 in Germany, $5.74 in France, $4 56 in Belgium and $3.55 in Austria; masons, $8 per week in England, $4.07 in Germany, $5.33 in France, $5.22 in Belgium and $3 73 in Austria; farm laborers, $3 per week in England, $3 06 in Germany, $3.10 in France, $2.72 in Belgium and $3.50 in Austria; coopers, $6 in England, $3 97 in Germany, $5.58 in France, $5.17 in Belgium and $3 64 in Austria; shoemakers, $6 per week in England, $2 95 in Germany and $2.90 in France.—Report of the Bureau of Labor Statistics.

THE ADVANCE OF STEEL.—The advances made in the last few years in the metallurgy of steel suggest possibilities that have heretofore hardly been imagined. The manufacture of armor plate of nickel-steel, and the treatment of it by the Harvey process and by oil-tempering, has resulted in a product so tough that it is very difficult to tool it, and a nickel-steel specimen has been tested by pulling, which gave, with 98,000 pounds tensile strength, 42 per cent elongation. A rail made of this kind of steel would be practically indestructible. It would cost a good deal more than any chief engineer would dare recommend. Railway directors would not be justified in considering posterity so far as to spend a company's money for such rails; but between a nickel-steel oil-tempered rail and the ordinary steel rail of commerce there is a line of greatest economy which has not even been approximated in rail-making.

WASTING TIMBER.—Eastern lumbermen visiting this coast express actual sorrow at the great waste evident here in the manufacture of lumber. In their own districts they have been for years reducing the amount of waste and utilizing the odds and ends. Comparing the amount wasted here with that in the East, they have no waste; still, they think they do, and are constantly devising plans to work up what is now wasted. An Eastern writer figures the loss from log to lumber in the white-pine mills from one-quarter to one-half of its cubic contents. He says that in the California mills the waste is from 60 to 62 per cent. No figures are given for the mills of Oregon and Washington, but they are in it on the waste question, and must continue to be until a denser population calls for the small articles that can be manufactured from what is now thrown away.—West Coast Lumberman.

THE HIGHEST CHIMNEY ON THE CONTINENT.—The highest chimney in Germany and probably on the Continent has just been built at Stolberg, near Aix-la-Chapelle. It is 407 feet high, and it stands, moreover, on an eminence which rises some 270 feet above the surrounding plain. The inside diameter of the stalk is, at the bottom, 16 feet 8 inches; at the top, nearly 10 feet. The chimney, provision for the ascent of which has been made by fixing iron stips in the masonry, has occupied six months in erection, and the work was carried out wholly without accident.

IT is said the wood on the north side of a tree will not warp as much as that on the south side; and that if trees are sawn in planes that run east and west, as the tree stood, they will warp less than if cut in the opposite direction. However this may be, it is certain that the tendency to warp when sawn into boards is much greater in green than in dry wood, and the convex side of the curve is always towards the heart. This warping, due to unequal shrinkage, and to the more open texture of the external portion of the tree, is not found to occur in the middle plank or board of the log, excepting as it may, in slight degree, reduce the breadth.—Canada Lumberman.

ARMOR-PLATES.—The heaviest armor-plates yet placed on an American warship are those just secured to the sides of the "Indiana," now building at the Cramp shipyard, in Philadelphia. These plates are made of nickel steel, are 14 inches thick, 6 feet high and 16 feet long, and weigh 26 tons each. The side armor of this ship will be 18 inches thick, and each plate will weigh 46 tons. The first named plates were forged at the shops of the Bethlehem Iron-works, and they cost $15,000 each. Diagonal plates of the same thickness as those just put on the "Indiana" have also been shipped from Bethlehem for the sister ship "Massachusetts."—Engineering News.

INSPECTOR-GENERAL DUMONT, of the U. S. Steamboat Inspection Service, reports to the Secretary of the Treasury that the number of persons carried on steamboats last year was 6,650,000,000. The number of lives lost was 200, or 138 less than in the previous year. Of the lives lost only 48 were passengers, the remainder was made up of officers and crews.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

NEW DISCOVERY.
Mines Revived and Miners Enriched
By the wonderful MacArthur-Forrest Process, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.
DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.
TRADE MARK.

(MACARTHUR-FORREST PROCESS)
GLASGOW WORKS The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.
General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.
Also mills in operation as follows, viz: Denver; The Livingstone Gold Mining Co., Boulder Co, Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co, Cal; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; The Pacific Gold and Silver Extraction Co., Oro Grande, San Bernardino Co., Cal.; Chample's Mines, Humbug District, Yavapai Co., Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.
The object of this company is to introduce the Mac Arthur-Forrest process.
We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.
If you desire an experimental test communicate with the secretary.
If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.
We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.
The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for friturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.
The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.
The most desirable class of ores for this process are the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.
We will be pleased to answer any inquiries and furnish any desired information. Address,
T. L. WISWALL,
P. O. Box 926. Gen. Mgr. and Secretary.

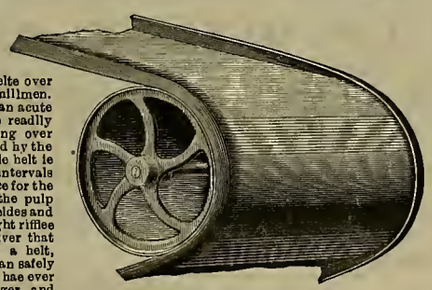
THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

HAARENBURGH.—Amador *Ledger*, Dec. 3: It is reported that A. Hayward has taken an interest in this property, and that consequently a thorough prospecting will be made. The shaft is 600 feet deep. Some fine ore has been taken out, but the ledge is small, and it is now necessary to go deeper, the expense of which is too heavy for those who have been operating the property for the past two years. There is strong reason for believing that the mine will improve when increased depth is reached. It has every appearance of being on the main gold-bearing ledge—the same formation as the Kennedy, Keystone, Eureka and other great bullion producers of the present and past. To explore it to the depth of 800 or 1000 feet is necessary to form a correct idea of its value, and the prospects are favorable that this will be done.

MISCELLANEOUS.—Something over one-half the pipe for the Zeile mine, to convey water from the ditch to the mill, is delivered on the ground. The storm will delay matters to some extent. It was the intention to lay the pipe at once, but whether this can be done now is problematical. The volume of water in the south fork—which has to be crossed—is too great to be controlled. The pipe, however, has to be tarred, and ditch made, and probably by the time this work is done the creek will have receded to its usual limits. At the Clinton Consolidated, J. B. Francis and W. J. Nettleare still employed as superintendent and foreman respectively. Mr. Rogers is in charge as general manager, in the place of D. Gutman. Sylvester G. Spagnoli, who has been deputy county clerk for many years, retired from that position on the 1st instant, and will devote his attention to placer mining at Clinton. He has some six acres of virgin placer ground, which is believed to be rich. The heavy rains have insured an abundance of water for mining purposes, and he proposes to work the ground this winter. George Thomas and I. N. Dewitt shipped a carload of rock from the Amador Queen to the city a week ago. They went down themselves a few days thereafter to see about their pay for extracting it. Stirnaman & James lately shipped 3500 pounds of ore from their claim near West Point bridge to San Francisco, and the returns amounted to $800.

Butte.

HE STRUCK IT RICH.—Chico *Chronicle-Record*, Nov. 30: Yesterday we had the pleasure of meeting the happiest man in Butte county at the present. He is R. S. Mundy from the forks of Butte creek. The storm is the indirect cause of his joy. Mr. Mundy is a miner and prospector, and has done a great deal of hard work along Butte creek with little more than a bare living as his returns. But on Tuesday morning his luck turned. Mundy has for some time been working a little claim on West Butte when there was water to be obtained. His claim is situated a short distance from C. W. Platt's place on West Butte, but his cabin is some distance below his claim on a high knoll. Between the cabin and claim are several little gullies, which, when it is raining, are torrents, and are dry during the summer. While crossing one of these torrents on Tuesday morning, Mr. Mundy, out of pure curiosity, took his shovel and threw up a little dam across the small stream, and, as he threw one shovelful of dirt from his shovel, he was overjoyed to find a nugget of gold worth $44 65. Thinking that where this nugget came from there were others, he began operations and search right there. He worked upstream on the sides of the gully, and, about 150 yards up the runway, found the edge of a small vein of decomposed quartz and sulphurets which was thickly studded with gold, and which he is fully satisfied is the parent ledge from which came the nuggets which he found. He says that he would almost bet his life that this ledge contains a series of rich pockets. He is so certain of this that he says $10,000 would not buy his find.

THE RIVER MINING DAME.—Oroville *Mercury*, Nov. 30: The Feather river booms! All of yesterday it rose steadily and this morning the rise was phenomenal even for this most erratic of streams. From seven o'clock this morning until ten the rise was seven feet, since which it has averaged about a foot an hour. Considerable anxiety being evinced by citizens regarding the effect of this vast amount of water on the Golden Gate and Golden Feather mines, a *Mercury* reporter interviewed Colonel McLaughlin, the manager of the mines, at his office. "The damage done by the sudden and heavy rise in the stream is merely nominal and hardly worth mentioning," he said. "Exclusive of the injury done to the telephone lines by the winds, the damage will not exceed $150. Only about 150 feet of old flume, which we did not think worth trying to save, has been carried away. The bed of the stream was stripped of all appliances several days ago, and we are in a position to resume operations next year at practically where we left off this season. Of course it goes without saying that the dams of both claims have stood the tremendous test nobly. The volume of water pouring over them and over the cement wall of the Golden Feather canal is a veritable Niagara. But the dams stand it without a quiver, and their stability is doubly assured after the sudden and almost unexpected test. The vast quantity of drift wood that has passed down the stream in the past few hours does not come from the mine, but from the mountains above, and passes over both dams." Apropos to this statement of Colonel McLaughlin's regarding the slight damage done by the sudden rise in the Feather at the river mines, it might be well to call attention to the fact that it is probably the first time in the history of such mining in California that complete and utter ruin did not follow the first freshets. This was true of the old Cape claim, the Union Cape, and in fact all of the mines of like nature on the Feather river. Thousands of dollars were lost and everything washed away.

Kern.

NEW MINING DISTRICT.—Inyo *Index* Nov. 30: During his visit here last week, Mr. F. S. Raymond of Freeman, Kern county (better known as Coyote Holes) gave an interesting account of very promising mining prospects in that section. The mines are in the Argus range, about 30 miles east of Coyote Holes, and are reported as extensive quartz lodes rich in free gold. W. C. Wilson and others of Mojave are preparing for working the new mines, and have already shipped in lumber for buildings and iron pipe for carrying water. The Argus range has long been regarded as a promising field for prospectors, and now that a start has been made, is likely to develop into a rich and extensive mining district.

Nevada.

THE CENTENNIAL GRAVEL MINE.—Virginia *Enterprise*, Nov. 30: In consideration of the impending storms of winter, which are heavier in Nevada county, Cal., where the mine is located, than here, the management has concluded to shut down for awhile. During the past year they have developed over 600 feet of good pay gravel, running across the famous old "Blue lead"—in fact, needing no more gravel. It has taken many years at an expense of $300,000 to arrive at this successful result, which has been achieved almost solely by Comstockers—Gold Hill and Virginia. The last assessment paid up all bills and left plenty in the treasury for future operations. As soon as spring will allow, a matter of a few weeks the proposed sluices will be put into position beyond the danger of wintry snowslides or freezing obstructions, and dividends instead of assessments will necessarily constitute the future programme of the Centennial.

HOISTING WORKS BOARED — Grass Valley *Telegraph*, Dec. 2: Last night the hoisting works belonging to the Alpha Mining Company, situated near the Idaho mine, were burned. The works have not been used for a very long time, and there was nothing of value in the building. Probably some tramp took refuge there during the storm, and was careless with fire. The loss is small.

Shasta.

INTROAAL QUICKSILVAR MINE—Redding *Free Press*: Frank Lindsay came down thie week from the Integral Co.'s works at Cinnabar, where he and Harry DePew were engaged in putting in a furnace for smelting quicksilver ore. Mr. Lindsay informs us that the furnace erected was the Knox patent, used at the celebrated Almaden mines, and has a capacity of 30 tons per day. This is the first of several to be erected later on, as soon as spring comes. The mine is close by, and the company has a store 24x30, a sawmill in operation, excellent quarters for the men and good grub. In fact, Frank speaks very highly of the management. Some 30 men have been employed, principally carpenters and laborers. Eleven men came over the mountain trail this week and experienced quite a hard trip, encountering about five feet of snow on the summit. The works will be closed down for the winter, but things will boom in the spring. The Integral camp is about 17 miles from Castella, over a trail. A packtrain with supplies has been running over there for some time, but the heavy machinery has been conveyed from Redding via Trinity Center. A large consignment of quicksilver flasks has just been received from the East. Mr. Lindsay will return in the spring and assist in the erection of several more furnaces.

BUNKER HILL MINING PROPERTY.—Our contemporaries have been publishing an item to the effect that Bill Murray and Vet Hull had bonded the old Bunker Hill mine on Middle creek, which in years past yielded large quantities of gold. We interviewed Mr. Murray Thursday, and learned that he and Mr. Hull had indeed secured a bond on 48 acres of the property for the term of two years. The bond was signed by Mrs. James Loag, who owns a half of 20 acres, Mrs. Carmichael (daughter of D. D. Harrell, deceased), who owns a fourth, and Daniel Lynch and J. V. Scott, who own another fourth—20 acres in all; then the signatures to the bond were obtained of Bob Kennedy, who owns 18 acres, and Peter Cusick, who owns 10 acres, the bond covering in all 48 acres, owned by those persons mentioned above. Mr. Murray informs us that he has prospected the ground recently, and that it shows up rich. For two years he has been figuring on this property, a bond to which he has at last succeeded in securing, assisted by Vet Hull.

THE SOUTH FORK PLANT.—W. W. Robinson of Igo informs us that from tests made there is no doubt but that the plant now in course of completion by Yount, Reid and Thistlewaite will work the ores of the South Fork district successfully. A test was made recently in a small way with a small furnace. Twenty pounds of ore each from the Crystal, Dayton and Big Central was tested in a small furnace, and by their process, and the ore worked to perfection and entirely satisfactory to all concerned. Mr. Thistlewaite has charge of the Crystal and proposes to work 100 tons as soon as the plant is finished. The ore from this mine will average 104 ounces to the ton. The Dayton ore was the most rebellious, yet it was worked successfully.

RICH SULPHURETS SHIPPED.—The Reid Mines Consolidated Company of Old Diggings has shipped a carload of rich sulphurets to the Portland Smelting and Refining Works, Linnton, Oregon. The directors had a meeting in San Francisco on Saturday last, and by reason of the wonderful developments in the mine, determined to advance the price of the treasury stock to $2.50 per share. The product of a week's run at the Hart mine in Old Diggings was 101¼ ounces, or something like $2700, or $12,000 per month. A heavy San Francisco company is working on a bond the Tom Greene mine, near French Gulch. Gould, who was the manager, has gone to seek newer fields of industry. He is said to be very sick.

Sierra.

ALASKA MINE AT PIKA CITY.—Nevada *Transcript*, Dec. 1: A strong company has been formed, with a hundred thousand dollars in bank, to start up the old Alaska mine, Sierra county. Owing to bad management and other causes, this famous mine was closed down about six years ago. It has a splendid record as a gold-producer, and it is the opinion of those who know all about the mine that it can be made, when thoroughly opened, one of the very best mines in the State. Several well-known capitalists, accompanied by two first-class mining men, went to mining Friday to start active work on the property. The late snowstorm has done considerable damage to the buildings and machinery, but all will be placed in good condition without unnecessary delay.

Siskiyou.

QUARTZ.—Yreka *Journal*, Dec. 7: The Siskiyou Mountain quartz mine, about three miles from Hilt's mill, above Henley, and near Cole's, is turning out exceedingly rich. With a two-stamp mill and two men drifting, the Spencer & Co. mine yielded about $8000 in 24 days, the ledge being a fissure vein, in which gold is plainly visible to the naked eye. Hilt and others have claims in the same vicinity, and the prospects are very favorable for that locality becoming one of the richest paying quartz-mining districts on the coast. James Ironsides made a cleanup last week from his Cherry Creek ledge, and sent the sulphurets below to Selby & Co., the returns from 100 tons, including sulphurets, averaging over $61 to the ton. He has uncovered the ledge for a distance of 1200 feet, and intends putting up a small quartz-mill in the spring at the head of Greenhorn, with two concentrators attached for saving the sulphurets. The sulphurets are very rich, and Selby & Co. work them so as to save at least 95 per cent of the gold. All the quartz ledges on Greenhorn, Cherry Creek, Deadwood and throughout the Humbug range, on west side of Yreka, will pay big if the sulphurets are scientifically treated, in saving the gold, as the flour gold is generally carried off in the fine sand which the quicksilver fails to catch. The concentrators save the sulphurets and fine gold by means of corrugated belting leading around wheels to a tub. In mills having no concentrators, the sulphurets and fine gold float off with the water from the batteries, and a similar result is experienced in placer mining also.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Enterprise*, Dec. 4: 1100 level—The west crosscut from the main north lateral drift, 315 feet north from the shaft station, has been advanced 32 feet; total length, 466 feet; face in porphyry and low-grade quartz which gives assays of $2 to $3 a ton. 1500 level—From the south drift at point of connection with the old stopes, we continue to extract some ore and fillings of average milling value. 1600 level—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted. 1650 level—Continue to extract some ore from the drift run east from winze No. 3, down 73 feet, in working upward from that point. Also some ore from the old stopes at the north end of the California ground. From the crosscut run west from the northwest drift we are running north in the old stopes and extracting some ore. 1750 level—Have continued to extract some milling ore from the point where the upraise from the end of the drift run south from the end of the crosscut run west from the end of the main southwest drift connects with the 9th floor openings. Are extracting ore along the drift which connected this upraise (45 feet up) with the upraise 44 feet east. Have continued stoping out ore along the drift run north from the crosscut run west from the main southwest drift. From the main southwest drift, 82 feet north from the east crosscut No. 5, an old west crosscut has been reopened a distance of 63 feet, and a north drift has been advanced 34 feet in a porphyry and quartz formation which gives a low assay value. 1800 level—In stoping upward from the drift run south from the crosscut run east from the bottom of winze No. 2, down 45 feet, have extracted some milling ore. There has been extracted from all parts of the mine during the week 959 580-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $24.79 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $20.33 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $16,835.40.

OPHIR.—1465 level—The upraise started on the sill floor, on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, has been carried up 8 feet; total length, 22 feet, the top being in porphyry and quartz. Have shipped to the Mexican mill 407 970-2000 tons of ore, the average assay value of which, per car samples, was $22.87 per ton. The average assay value of all the ore worked at that mill, per battery samples, was $18.60 per ton.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 25 feet; total length, 351 feet; continuing in a porphyry formation with lines of low-grade quartz.

HALE & NORCROSS.—We continue retimbering main shaft at the 800 level. Main incline—Are making the necessary repairs. 1300—Are repairing the north drift. 1800—Advanced No. 1 west crosscut 18 feet; total length, 192 feet; face in porphyry. West crosscut No. 3 was advanced 20 feet; total length, 140 feet; face in hard porphyry, Advanced main north drift 19 feet; total length, 294 feet; face in porphyry. During the coming week a west crosscut (No. 4) will be started from the main north drift on this level, near the north line of the mine. The west drift on the 150 level of the old or A-street workings was extended 28 feet, making its total length 112 feet; face in porphyry, with some streaks of quartz.

ANNEX.—On the 420 level the north drift from east crosscut No. 1, north, was advanced 15 feet; total length, 78 feet; formation, porphyry and clay.

BEST & BELCHER.—200 level—On this level the northwest drift has been advanced 22 feet during the week; total length, 42 feet; face in porphyry. All work on the 900 level during the week has been on repairs.

GOULD & CURRY.—200 level — West crosscut No. 5 has been advanced 21 feet during the past week; total length, 142 feet; face in porphyry, clay and stringers of quartz. West crosscut No. 6 has been extended 8 feet through soft porphyry; total length, 20 feet. On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 12 feet; total length, 71 feet; face in very hard porphyry.

ARIZONA.

ARIZONA TOMBSTONE.—*Epitaph*, Nov. 30: Much activity in mining circles, even at the present low price of silver, is being felt in and around Tombstone. The end of the year is fast approaching, and assessment work is now the order of the day. Many chloriders who have leases on different properties, and who own mines elsewhere in the district, are doing assessment work on them, while many other properties which have been idle for the past year are developed to the extent of $100, and it is expected that between now and New Year, few, if not many, strikes will be made. Some of the mines being worked by chloriders, all of whom are making good wages, are looking well, while others are doing considerable development work.

T. M. & M. Co., which ranks first as silver-producer in the territory, speaks highly of the management of the present superintendent, W. F. Staunton. It is needless to go into details of the extensive development of this mammoth property, as its shipments of from 800 to 1000 tons per month speak for themselves. In addition, the expansion joints for the new pump have arrived, and having been placed in proper condition, exceeds all expectations. The depth is now 130 feet below water level, and the intention is, with the present capacity of this pump, the shaft will be sunk about 200 to 250 feet lower and operations will commence on the 1st, and undoubtedly a new force of men will be required.

THE JONIETTA, which has been under lease to Perasich, Farrington and Scribner up to the 20th, has been renewed and a fresh start on this silver-producer will be made on the 1st. This property looks well, and the present indications are looked upon very favorably by the lessees.

STATE OF MAINE is under lease to six different parties, who are working in ore, and another shipment is expected to be made by the 1st.

BROTHER JONATHAN, being worked by Heli and Mitchell, is looking favorable. Considerable work is being done on this mine, and a shipment from this promising property will soon be made.

XXX MINE, under lease to Frary and Cronchley, is one of the State of Maine group, and the lessees are satisfied with the outlook. Regular shipments from this mine are being made, and another will be added to the list shortly.

BONANZA.—This property is being worked by George Bravin and Harris Bros. A shipment was made recently, and at present, development work is being rapidly pushed.

CHANCE, belonging to the Grand Central Co., is under the able management of Leach and Jones, and a shipment is now on the road to the smelter. Judging from the amount of ore in sight, and the active development of this bonanza, the force of men will be enlarged to push work more rapidly and increase shipments to a regular routine.

UNCLE SAM, worked by George and Houghton, is looking encouraging. Work is being concentrated in sinking main shaft to lower level, and drifting will be begun as soon as completed.

RANDOLPH.—McPherson's 16-mule ore teams are busily engaged hauling a shipment of rich ore from this property. Warner and Bell are the lucky owners.

ALASKA.

COOK'S INLET COAL.—Cor. Juneau *Mining Record*, Nov. 10: I have located a coal claim, and have also located an agricultural claim. They are not far apart. The coal claim has three separate veins that show plainly; two veins are about six feet each in thickness, the other somewhat smaller. The coal is good, cannot be beaten for domestic purposes. I am confident that in the near future these mines will supply a large demand on this coast; there is an unlimited quantity that is far superior to any coal that I have ever seen on this coast. If the location was where it could be seen by capitalists, I do not think that there would be any doubt of their investing. The country is new and there is not much doing at present. There are miles and miles of fine grass in sections of this country. I think it is a kind of blue joint and grows three to five feet high. I have every confidence in the country; the coal mines of themselves are sure to develop it early, outside of grazing lands.

BRITISH COLUMBIA.

VANCOUVER HYDRAULIC COMPANY.—Kamloops *Sentinel*, Nov. 30: This company having got their works in readiness at Van Winkle bar, as reported last week, let water onto their gravel, but owing to the severe weather which began last Friday, they were compelled to stop operations. The company has only available about 700 ont of the 1200 to 1500 miners' inchee of water to which they have secured the rigbt, but even with tbis diminished qnantity, the engineering and mecbanical arrangements were found to be most eatisfactory, and to give assurance to those who have embarked their capital in tbe enterprise, tbat their money has been expended jndiciously and with excellent judgment. It is not yet decided whether operations will be resumed again tbis season, as that will depend on tbe weather. Should it continue inclement, it ie probable that the company will decide to snspend further operations nntil the spring, and make a clean-up now of tbe week's work. When in full operation the hydraulic appliances are sufficient to wasb from 3500 to 5000 cnbic yards (according to tbe circumstances) of gravel in the 24 hours. The company have abont 800 acres of gronnd, the gravel heing on three benches, and tbe depth of them varies between 120 and 400 feet.

COLORADO.

NOTES.—A Denver dispatch of Dec. 5th says: The great Gowan Haven tnnnel at Aspen has broken all of its previons records, for during the month of November it was extended 379 feet. The face of the tunnel is now over one and a half miles from the entrance. The greatest distance driven during any previous month was 312½ feet. The Aspen Mining and Smelting Company shipped during November 3858 tons. During the year the mine has shipped 37,400 tons of ore and has done 11,600 feet of development work, amonnting to over two miles. The Aspen mine shipped 3600 tons last month. There are 245 men on the pay roll. The Champion mine at Lake City has just been sold to Benner & Hessler of Abilene, Kan., for $100,000, of wbich $22,000 was cash. There has been considerable activity in the Cripple Creek district the past week, and arrangements have heen made for the location of a large nnmber of new stamp-mills. A nnmber of contracts have been let, and it is easy to estimate that at least 1000 stamps will he working before April 1st. New strikes are still being made daily and everything looks encouraging for this camp to to make the finest producer the west has ever known. Dnring the week small sales aggregating over $100,000 were reported. An average of five carloads of ore per day ie being shipped to smelters from this camp. The stamp-mill located here treats about the same amount, making a total daily outpnt of ten cars, or 150 tone.

NEW MEXICO.

TURQUOISE MINE.—Silver City *Enterprise*, Dec. 3: The mine owned and worked by Armeny & Co., near Paschal, is making its regular shipments of fine turquoise, and from all appearances must be returning a good profit to the owners, as it has been kept in constant operation for more than a year, and it ie not probable that it would be worked continnously and regnlar shipments made if it were not paying. This company is a close corporation, and gives no figures for pnblication; but from every evidence of success apparent at this mine, and from equally good indications at other mines in the county, it may be safely predicted that turqnoise mining will ere long be a prominent indnstry in Grant connty.

MOGOLLONS.—The Mand S mine and mill are running full blast. The bnllion shipments are being regularly made hy the company. The Last Chance lessees are taking out good ore from the mine, and bullion shipmente from the mill will soon be the order of the day. The strike in the Eberle proves beyond donht that tbe great veins known as the Queen and Great Western have large extensive ore bodies at intervals for miles along their length. The immense ore bodies in sight in the Consolidated mine npon the Queen lode are not being utilized for lack of milling facilities. While one-third of the value of the ores of thie camp is gold, and while it is probable that the gold alone would pay a profit over and above the cost of mining and milling, yet the owners of the valuable properties are reluctant to place their ores or bullion prodnced upon the market in the present and unetable state of the silver market. No one cares to take new ventures in hnilding mills or increasing the capacity of those tbey now have nntil some positive settlement of the silver question is arrived at. Let this matter be placed npon some positively permanent basis, and the Mogollons will boom.

OREGON.

CABLE COVE DISTRICT.—Bedrock *Democrat*, Nov. 30: J. C. Young is in from the Grey Eagle and reports mining affairs eteady in that section. Development work is being pushed ahead and on many properties will continne all winter. A large amonnt of good ore is being extracted and the veins improve as work progresses. Mr. Young, like all who are acqnainted with the Cable Cove district, has nnflinching faith in the camp and says that time is all that is required to prove the merits of the numerous propertiee of that section.

A MINING CONTEST.—One of the most interesting law suits tbat will come before the next term of the Circnit Court is the White Swan mining case. The ownership of thie valuable property ie claimed by Ed. Borman, who avers that the ground is covered in his St. John location, an adjoining property that was discovered several years since. Messrs. W. H. Mulkey, S. B. Baisley and G. S. Tarbell claim to be the rightful owners to the White Swan quartz claim, hy virtue of discovery and the fulfillment of the requirements of the mining laws. This property came into promiuence about one year ago, when these gentlemen opened np the property, exposing a rich vein of free-gold ore and taking ont thousands of dollars of the yellow metal in a short time. Abont two months since Messrs. Mulkey, Baisley and Tarbell mane applications in the U. S. land office at La Grande for a patent to the mine and an adverse claim has been presented by Mr. Borman.

MONTANA.

SOUTHRAN CROSE AFFAIRS.—Butte *Miner*, Dec. 1: Salton Cameron, the mine and mill man of the Georgetown district, was in the city a few days ago for the purpose, it is said, of completing arrangements for starting up his mill on Southern Cross ore. The Southern Cross Company is figuring on treating its product by the cyanide process, and is negotiating with Mr. Cameron for the use of his mill therefor. The ore, of couree, will first be crushed by the ordinary etamp method and then be snbjected to cyanide treatment, tanke for which either bave been or will be placed in the mill. It has also been hinted that a change in the personnel of the corporation, so far as the president, secretary and manager are concerned, will be made, the directors, so the report saye, believing that the interests of the stockbolders will be best subserved thereby. The district in whicb the Southern Cross is located is a good one, and there are many who believe that with proper management the property can be tranefermed from a name into a gold-producer of merit.

RADUCAN SHIPMANTE.—That the emelters at Anaconda are not receiving as much ore from the company's mines in Bntte ae they were eight or ten days ago is evidenced hy the fact that on last Monday the daily shipments were reduced from 105 to 90 carloads, which makes a shipment of abont 375 tons. A few months ago the company was shipping from 150 to 160 cars per day, bnt a decision to curtail the production of copper cansed a falling off of nearly 30 per cent. The 375 tons is about the daily prodnction of the Monntain Consolidated mine, which was closed down about 11 days ago to permit of repairs to the shaft.

DIVIDENNS FOR TEN MONTHE.—Miniug companies of the State have paid dividends from January 1st to October 31et as follows: Bald Butte, $20,000; Bannister (Butte), $6000; Elkborn, $275,000; Granite Mountain, $500,000; Hecla, $150,000; Helena and Frisco, $20,000; Iron Mountain, $135,000; Pandora (Soap gulch), $3000; Parrot (Butte), $180,000. Total, $1,289,000.

RICH STRIKE IN THA DESPATCH.—Among the rich strikes made during the week was one in the Deepatch mine, adjoining the Star West on the south. The property ie owned by George W. Farlin and is located in the rich gold-silver district of the camp. The body of ore encountered is said to be quite extensive.

OREGON.

AT ELKHORN MOUNTAIN.—Cor. Bedrock *Democrat*, Nov. 30: The Baisley-Elkhorn mill and mine are running at full capacity, and to judge from the enormons ore-bodies in sight, they are liable to run for two or three years. If large bodies of ore and a well-eqnipped mine mean a paying property, the Baisley mine is one of the best payiug properties in Oregon. It is a etrange matter that Portland capital does not look at the mineral resonrces of eastern Oregon and devise some ways and meane of treating ores in Oregon. Capital can and should erect rednction works right here in Baker conuty to treat the ores of this conuty alone, and we are snre they would be eurprised at the income derived from euch an adventure. The Robbins mine is working a small force. They have completed the connection from the lower to the upper tnnnel, and now have good air throughout the mine. No doubt she will etart np ere long. The Hnrdy Gurdy mine and mill have closed down for the winter, owing to the fact that they commenced operations too late in the season to secure their winter's enpply of wood.

UTAH.

ONTARIO.—Park *Record*, Dec. 3: It will be remembered that R. C. Chambers went east last week and the *Record* eaid it was presumed hie mission was to pick up any etray sharee of etock that might be floating about the eastern market. Onr informant says that his missiou is of a different nature altogether—that it is to hold a general consultation looking to a large increase in the output of the Ontario mine. This means that not only will the quantity of shipping ore now being mined be increased, but also an addition to the company's present milling capacity. Our informant says he knows positively that such an increase has been nnder contemplation for some time and that Mr. Chambers has been snmmoned for consultation to that end. This means a great deal for the fntnre of Park City ehonld the company decide to make a large increase in its present facilities, and shonld the monetary conference result in the recognition of silver as a money metal, the benefits will be something that cannot be fully realized.

CAMP CROSSCURE.—The Crescent will drive its big drain tunnel and work will be commenced as soon as the preliminary arrangements are perfected. Drifting on the vein has commenced at the Cumberland and the property is looking fine. The indications for pay ore grow brighter and brighter. Ore hauling ie quite lively considering the conditions of the roads, and the big mines are sending down heavy shipments. Mattere are reported as growing worse in the Ontario drain tunnel. The volnme of water is eteadily increasing and the eand and loose rock is much more troublesome. The Glencoe is pushing developments eteadily and quietly. The Daly West is still sinking, the shaft being over 1200 feet in depth. A drift is being run from the 800 level of the old Daly to furnish better air and a perfect drain and connection betweeu the two properties will eoon be established. Operations were commenced on the Meears group Wednesday morning and the property is being placed in sbape to begin active sinking and drifting. Some ore is being hoisted that was broken down before work was discontinued last snmmer. It is hoped that no more interruptions will occur and tbat the Meears will eoon develop into a shipping property.

SOUTH DAKOTA.

NOTES.—Deadwood *Pioneer*, Nov. 30: The Black Hills Mining Company, whose plant ie located at Rapid City, has put in a ten-ton Brackner roaster—tbe largest in the Hills—and bas another one on the ground ready to put in. Specnlating in mining stocks is almost a thing of the past. Tbose who own stocks prefer to bold them, and those who do not own stocks buy claims for development. Ruby Bell eold at 22c, Uncle Sam at 1c, Carthage 1c. Harris Franklin has a lot of ores, consisting of 30 tons, taken from the Golden Reward, Double Standard and other mines, which he will take to Pittsburg, Kan., for a test run by the "Chick Rapid Extraction" process. The Buxton Company is making regular shipments of eix carloads of ore per week from the Buxton property to Aurora, Ill., notwithstanding the fact tbat the opinion was expressed over a year ago that the mine was worked out. Superintendent Hunter of the Hawkeye mine is looking daily for the arrival of the machinery for his 40-stamp mill. He has a force of men at work on the tram and will add to the number of men at once. Mr. Hunter hopes to begin milling by January 1. The J. R. Mining Company has its engine and boiler in position and is at present sawing lumber for use on the mill and mine. The stamps will begin dropping again in a few days, and mine and mill will run all winter. Five stamps have been added to the batteries. The shaft of the Cliuton Company passed throngh an ore zone five feet thick at a depth of 145 feet. After passing the zone, drifting to the east commenced, and it is confidently expected that the ore body will be encountered within a distance of 50 feet from the bottom of tbe shaft. Messrs. Waite and Ankeny are erecting a first class steam hoist over the two-compartment shaft of the Florence, which will be completed in about a week. The fact that the mines of this company were prospected with a diamond drill before the commencement of these expensive works and improvements, leads one to infer that the result of the prospecting was satisfactory.

WASHINGTON.

SLOCAN.—Spokane *Chronicle*, Dec. 2: Another big mining deal was closed yesterday, iu wbich three of the rich Slocan properties were sold to Spokane parties. It was what is known as the Alamo group, consisting of the Alamo, Twin Lakes and Ivy Leaf claims. They were sold by Albert Behne, James Gillhooley and Andrew J. Murphy to H. D. Scribner and J. L. Drumheller for $40,000. The sale might be called a conditional one, or perhaps more properly a bond. The pnrchasers will begin working three ehifts of men in developing the properties. The location is nesr the Idaho line. This ie the largest price paid for Slocan claims, with one exception. Mr. Patsy Clark paid $75,000 for a group of four claims.

Eastern Metal Markets.

NEW YORK, Dec. 8.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39 3-16	85¼	12 00	3 65	20 07½
Friday	39⅜	85¼	12 00	3 55	20 00
Saturday	39	85	12 00	3 65	20 00
Monday	38⅞	84¾	12 00	3 65	19 20
Tuesday	38⅝	84	12 20	3 75	19 65
Wednesday	38½	83½	12 20	3 75	19 45

Pig iron is weak at the recent decline. Quicksilver is steady. Copper is very strong, with holders firm in their advanced views. Pig tin is weak in sympathy with silver. Pig lead is barely steady.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEAK ENDING NOV. 29, 1892.

487,206.—FAUCET AND BUSHING—M. Anthony, Berkeley, Cal.

487,207.—FAUCET AND BUSHING—M. Anthony, Berkeley, Cal.

487,112.—NECK YOKE—J. S. Brown, Eureka, Cal.

486,859.—WATER FILTER—Joseph Davis, San Francisco.

486,860.—WATAA FILTER—Joseph Davis, San Francisco.

487,118.—REVERSIBLA WINDOW—Jas. Farqnharson, Tacoma, Wash.

487,217.—ROTARY ENGINA—Gsmbetta & Harsin, Stockton, Cal.

486,981.—SHOW WINDOW STANN—C. H. Grueuhagen, San Francisco.

487,051.—DIAPHAAOM FOR GAE METARS—A. Henning, Los Angeles, Cal.

487,221.—ROTAAY MOTOR—Robt. Hewson, San Francisco.

486,932.—TIRE SETTAA AND COOLER—A. J. Ianson, Waverly, Wash.

487,123.—BIT BRACA—A. Knudsen, Tucson, A. T.

487,199.—REFAIOAAATOR—A. McDowell, Selma, Cal.

486,897.—HYDAAULIC MINING APPARATUE—A. M. Rawson, San Francisco.

487,201.—VEHICLE SPRING—H. Timkeu, San Diego, Cal.

487,202.—VEHICLA SPRING—H. Timken, San Diego, Cal.

487,138.—COMBINATION LOCK—E. Vanwart, Port Madison, Wash.

The following brief list by telegraph, for Dec. 6, will appear more complete on receipt of mail advices:

California—Robert Beyrle, Los Angeles, filtering system; Thaddeus B. Rower, San Francisco, car coupling; Henry E. Dikeman, Berkeley, track brake; Andrew Frazier, San Francisco, ore concentrating machine; David Evans, Eureka, logging railway; Alfred Gonzales, San Francisco, ore concentrator; Frank A. Huntington, San Francisco, ore car; Frederick S. More, Hanford, plow; Joseph Rodes, San Diego, camera tripod; Mark P. Schetzel, San Francisco, covering for buildings; William. H. Scott, San Francisco, bed bottom; Edward T. Steen, San Francisco, pipe coupling; Melvin A. Taylor, Oakland, routing machine; George Weeks, Oakland, rail joint. Washington—Stephen Chaplin, Buckley, valve gear; Arthur M. Leighton, Port Townsend, last; Robert Moran, Seattle, coin-actuated vending machine. Oregon—Robert D. Hume, Gold Beach, can-lacquering machine; Clarence J. Simeral, Maccay, gate.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRASS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMPOUNN ROTARY ENGINE—John Gambetta and Chas. D. Harsin, Stockton. No. 487,217. Dated Nov. 29, 1892. In this patent the inventors have shown two pairs of cylinders fixed at equal distances apart around the interior of a rim or casing which rotates npon a central axis. The outer ends of these cylinders are closed and the inner ende open. The pistone of these cylinders are connected by suitable pitmen with a stationary crankpin, which ie eccentric to the center about which the rim and cylinders revolve, and it will be manifest that as the rim and cylinders revolve about this crankpin the pistons will be alternately reciprocated within their cylinders; and when steam or other pressnre is applied behind these pistons, they will act upon this etationary crankpin to rotate the cylinders and rim. In the present invention, each pair of opposiog cylinders is compounded; that is, one of the cylinders receives steam directly at high pressure, and, when it has acted so as to carry the rim and cylinder one-half a revolntion, the steam is exhausted through suitable passages into the opposing cylinder, which is of larger diameter, and within which the steam acts npon its piston expansively.

RAFRIOERATOR.—Albert McDowell, Selma, aseignor of one-half to John A. Stroud. No. 487,199. Dated Nov. 29, 1892. The invention relates to the class of coolers designed to contain water or perishable articles. It consists in the novel construction of the outer casing and inner chamber of the cooler with encircling air-passages and satnrated absorbent coverings, and the novel construction and arrangement of the feeding device by which water is automatically snpplied by the absorbent coverings.

ROTARY MOTOR.—Robert Hewson, S. F. No. 487,221. Dsted Nov. 29, 1891. This invention relates to the employment of steam under pressnre npon a wheel so as to take advantage of its reactionary force. The wheel has peculiarly formed buckets or vanes fixed around its periphery and in a double row, one set of bnckets acting oppositely to the other, so that the movement of the wheel may be reversed. The wheel is monnted upon a shaft and rotates in close contact with a surface throngh which openings are made from the eteam chest to deliver steam under high pressure into the bnckets of the wheel and canse it to rotate in either direction, as desired. Independent valves control each of the parts, and the power of this wheel may thns be increased or diminished to snit conditione. Within the exhaust chamber is a heating coil for the boiler feed-water.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Dec. 8, 1892.

With clear skies and improving roads, general trade is now active, particularly for holiday goods. The trade continues to buy in a small way, preferring to purchase oftener than to carry large lines of goods. This spirit of conservatism has placed merchants, as a rule, on this coast upon a solid footing, from which they should not be allured even during the prospective active times in 1893. With iron-workers and manufacturers in general, business is only moderately fair. The Monetary Conference and the uncertainty regarding silver are important factors for the movement, and until the future is more clearly defined, it looks as if no improvement can be expected. If the Conference should act favorable toward the white metal, it is contended that general activity in trade circles and manufactures can reasonably be looked for. At this writing, press dispatches throw a dark cloud around the proceedings of the Conference, from which deductions are drawn that it will prove a failure. While this may possibly prove to be true, yet the writer fails to see any such signs as to warrant such conclusions, but, on the contrary, much to justify that a compromise will finally result. This opinion is largely founded on the well-known fact that when the extremes meet each makes a proposition, and, after contending for points, an agreement is usually arrived at. In this instance, it now looks as if this course will follow regarding the silver problem. England, as a monometallist or gold country, through its delegates, has made concessions to bimetallists in the form of an agreement by which the market value of the white metal will not go below $1 an ounce. This, from her point of view, is quite a concession. The United States, through her delegates, contends for free coinage by all countries of both gold and silver—the latter at the ratio of 16 to 1. While it does not look as if this ratio will be secured, unless this country and the silver-using nations make concessions in duties on certain foreign goods, yet a higher ratio may possibly be agreed on. The committee, to which was referred the various plans, is hard at work, and, so far as we are advised, have not formulated any plan. While the committee is in session the delegates at each general or public meeting of the Conference discuss the money question in its various bearings. It is by discussion that persons are enlightened and bimetallism seeks such means of proselyting. Judging from press telegrams, strong pressure is being brought to bear by several industries in Europe on monometallists in favor of silver.

The local money market, for the season of the year, is fairly easy, when it is considered that the uncertainty regarding silver is a prime factor in creating a spirit of caution on the part of outside capitalists and banks. Fears that the monetary conference will prove a failure cause banks to prepare for the worst, so as to meet any financial panic which may be precipitated by a fall in the market value of silver. So far as we are able to learn, there is less commercial paper on the market in this month than at the corresponding time for years. Arguing from this we should say that the merchants, manufacturers and others in business are situated better, financially, than for years. There is a fair demand for exchange on New York and London, and under light offerings rates hold strong.

Eastern mail advices report general activity, for the season of the year, in all branches of trade, with the south and southwestern States purchasing freely. The advance in the market price of cotton has contributed no little to this improvement. It is stated that in several branches manufacturers have not only sold well up but have large orders ahead. This activity finds proof in the gradual advance of the wages of factory hands. The money markets at the East continue to be reported as working easy. A leading authority says that there is a scarcity of commercial paper, although more was on the market owing to fears of gold shipments. With gold shipments resumed, it was contended, it would create more or less of an artificial stringency.

SILVER—The market held fairly firm up to Tuesday, when it broke off about two cents under strong bear selling at the East and abroad, owing to public and private advices to the effect that the Monetary Conference would prove to be a failure. These reports were widely circulated and generally believed, in the face of the committee, to which all proposals were submitted, not having reported or even formulated a plan. That these reports were put out for speculative purposes does not admit of a doubt, and that they were a success, so far as depreciating nearly all commodities and securities are concerned, is equally as certain. It now looks as if silver will be a good gamble, for, while the conference is in session, there ought to be lively turns in the market. A bill has been introduced in the lower house of Congress and another in the Senate repealing the present law authorizing the purchase of 4,500,000 ounces of silver bullion a month. From all present indications, it looks as if nothing will be done by Congress legislating on silver until the Monetary Conference acts, when a bill will be passed in conformity to the plans adopted by the conference. Press telegrams quote the New York market at 82¾ cents to-day. There was exported the past week $164,500 in bullion to Bombay and $1160 to China.

MEXICAN DOLLARS—The market is quiet, with prices, since the steamship for China sailed, altogether nominal. Large buyers bid 66 cents. The last steamship for China took out $390,111 to China and $67,780 to Japan.

QUICKSILVER—Receipts the past week were light, aggregating only 159 flasks. The market is quiet at current quotations. The exports by sea aggregate 50 flasks to Mexico.

ANTIMONY—The market is quiet. New York mail advices quote that market for round parcels as follows: 10¾c for Hallet's; 10¾c@11c for LX; 11c@11¼c for Crown; and 11½c for Cookson's in round lots.

BORAX—The receipt of only 373 ctls was reported the past week, while 4254 ctls were exported by sea to New York. The market is fairly steady.

LIME—Receipts the past week aggregate 1136 bbls. The market is slow at from $1.25@1.50 per bbl.

PIG LEAD—There is nothing essentially new to report in our market. The demand is slow at unchanged quotations. New York advices report an improved demand for consumption.

PIG IRON—In our market there is no feature worth reporting. Eastern advices are conflicting. Southern iron companies were offering more freely, with some offering concessions. The markets were more or less affected by the decline.

TIN—Pig is quiet, as is plate. Consumers are not disposed to talk business unless for delivery in the spring and summer months. London cables report some business passing in choice coke for shipment to this city. The New York market for pig appears to be still largely under manipulation. The unsettled price of silver is against pig tin.

COPPER — The market has exhibited more strength, with an advance established. *Iron Age* of Dec. 1 reports the New York market as follows: "While there is still some difference of opinion regarding the transactions in Lake Superior product, facts have come to the surface showing that good-sized contracts were placed during the first half of November, and that the quantity of ingot and wire bars amounted to at least 6,000,000 pounds. Some reports have it that fully 10,000,000 pounds were placed during the month. For the past week nothing is reported outside of commonplace transactions; but the movement of prices has been toward a higher level." London cables, Dec. 1, report as follows: "In copper prices there has been a further advance of 17s 6d, followed by a subsequent slight reaction. Speculative interest has been broader, consumption good, the statistical position improved and comparatively little metal offered."

COAL—Imports the past week aggregate as follows: Tacoma 3900 tons, Comox 4100, Challam Bay 1483, Coos Bay 500, Departure Bay 7202, Swansea 7339, Nanaimo 8599, and Seattle 2000; total, 35,123 tons. Cool weather following the rains has stimulated the demand for household, which caused a slightly better call from dealers. In the market there is no material change to note. There is a feeling that prices ought to go up slightly, but they do not, and, at this writing, they look as if they will not. The lower freights made by the railroad on Rocky Spring (Wyoming) coal allows dealers to handle this coal to a much better advantage. For an all around coal, many contend that it is the best in the market.

Mining Share Market.

SAN FRANCISCO, Dec. 7, 1892.

Mining shares the past week under review were more or less neglected by the trading public. Chippers and turntakers are about all that is left of the outside traders, and to make a respectable showing of business cross-orders are resorted to by insiders. From an outside point of view, the market acts very much as if insiders are holding out inducements to moneyed outsiders to enter the market, but as "the burnt child dreads the fire," so do victims of the share market fear to place themselves again in the power of the rings. That still greater efforts will be made to get buyers for shares is an open secret, but it is not at all likely that the inside will get them to hold long enough to pay assessments, for it looks very much as if it is for this purpose that any up-move will be made. On the Belcher move a large quantity of shares is said to have been sold, but when prices went off, buyers began to sell back, and the result is that insiders got the shares back again; and now these same shares must be sold again so as to collect, if possible, assessments which must follow those now levied. The ore development in Belcher sent the shares in that mine up to $6.50 per share, and as other mines in the Gold Hill group are running west to strike that lode, it is not at all unlikely but another boom-let will be successfully made. This time it is said, by persons who ought to know, that insiders will try and get those who buy to hold longer. Of course, the paper now engaged in running the mines down will tell more about ore developments than the mine-owners themselves know. It is a great game, this, working the Comstock mines. It is not denied by miners that there is a lode to the west, but it is narrow. Still, in any other district but the Comstock, the ore extracted would pay handsomely; but wood, water, transportation, miners' wages and indeed everything else cost high, which, with prospecting and dead work to get the mines into better shape, eat up the bullion produced. Every intelligent miner knows this to be the case. The Comstock mines are, without doubt, the most expensive mines to work that there are on this coast. It was thought that large quantities of bullion, outside of what is said to have been proven to have gone astray in the Hale & Norcross suit, were misplaced and that several mines would be paying dividends if the laws under which the companies incorporated were conformed to, but this supposition, so far, has proven wrong. Although several mine superintendents give car-sample assays, as well as pulp assays, yet the companies run in debt, while only two manage to save a little money. The writer fought the rings for over four years to have mine superintendents conform to the law under which the companies incorporated by giving car-sample assays, making full reports of the work, strikes, etc., thinking that this would lead to paying dividends. It now looks that unless larger ore developments are uncovered than are now made public, dividends will be few and far between. Perhaps the companies which are not conforming to the law, giving car-sample assays, etc., have large developments of high-grade ore which, if properly milled, would pay dividends. It stands to reason that honest management invites investigation, and should conform to all laws under which the companies incorporated.

There is a general belief on the street that insiders will not advance the share market until after the holidays, and in the meantime depress prices as much as possible. This is based on the fact that there has not, for years, been a boom before Christmas, and besides, the silver question is against an upmove. There are those, however, who contend that we will have a boomlet before the holidays and none in the forepart of next year. Time alone will tell which side is correct.

News from the Comstock mines is of more work started to the west. It looks very much as if the companies, being hopeless of finding anything big on the main lode, have determined to run for the west lode struck by Belcher. While this work is under way, shares ought to be lively and an attractive gamble for turn-takers. Whether any large development, more than for a milling proposition and for share gambling, will be found, is problematical. The news from the Comstock mines is that in Belcher they have run into four-foot ore, in an upraise, which assays about $45 per ton. When connections are made above, prospecting work will be continued south toward Seg. Belcher. In Crown Point, on the 400-foot level, faster progress in the west crosscut is being made than had been expected, but as the work gets nearer to the west lode slower progress will probably have to be made, owing to the treacherous character of the ground. The west crosscut on the 1300-foot level in Seg. Belcher is being pushed. From Yellow Jacket conflicting reports are received. In Con. Imperial, on the Sage Brush level, a west crosscut is being run. It is some satisfaction to know that prospecting work is being done in this mine. From Confidence and Challenge come the usual stereotyped porphyry and quartz of no value. The work in these two mines is toward the west. In Bullion an important west crosscut is being run on the 1800-foot level. Perhaps this will help to sell the Potosi shares. The work in the latter mines continues to be reported a gamble. News from Choller appears to be kept back. It is rumored, but bow correct we do not know, that very important work is being done in Hale & Norcross. The official letter states that west crosscut No. 4 had been started near the north line on the 1800-foot level. Active prospecting work is being done in Savage, Best & Belcher, Opbir, Mexican and Sierra Nevada. In the Devil's Gate group of mines more activity is reported, with New York shipping ore for reduction. In Silver Hill, in this group, a vein of $7 to $8 gold ore has been struck. In any district in California this would pay handsomely, but on the Comstock it does not and will not until expenses are reduced very considerably.

From the outside mining districts nothing has come to hand beyond the usual weekly routine reports.

The market opened this (Thursday) morning quiet but steady. After Call, Potosi advanced to $2 on a reported improvement in the mine, but it soon fell back, with outsiders selling. Those in position to know, say that the market must go lower, and that there will not be anything until after the holidays. These same persons had the Con. Virginia in 1891, when the shares sold up to $20.87½ in May. The market was depressed and prices sent down in December of 1890, with slightly lower prices after January 1, 1891; but those who held shares made the money. Perhaps we may have an up-move in this month this year, and a boomerang the forepart of 1893.

MINING SHAREHOLDERS' DIRECTORY.

P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b

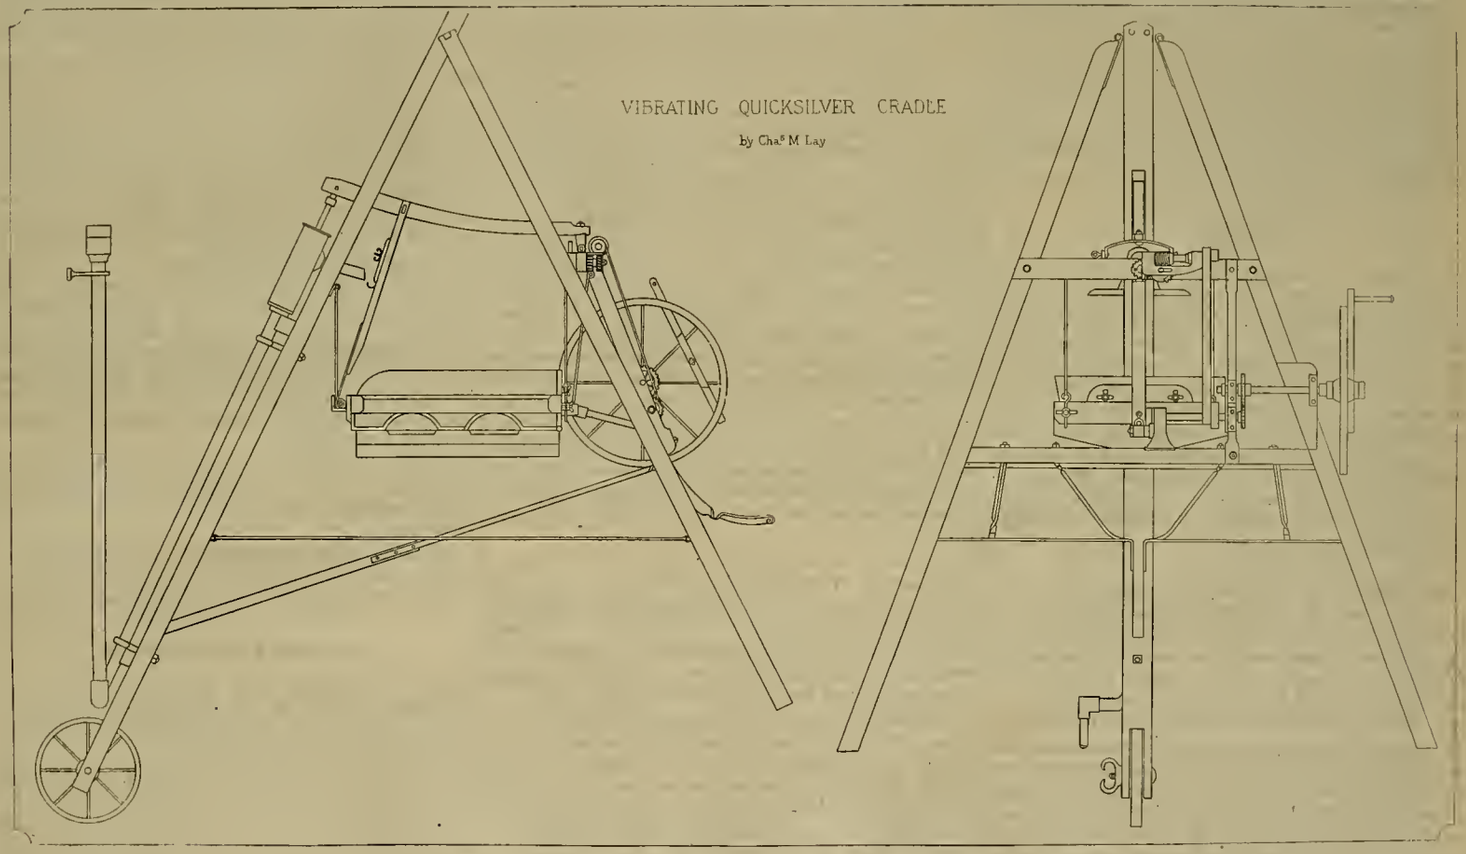
Lay's Vibrating Quicksilver Cradle.

The general arrangement of this machine may he seen by the drawings. The action is as follows: Motion is given to a shaft carrying a flywheel hy hand or otherwise. This ahaft at the other end has a spurwheel working into one of half the diameter on a countershaft, at the other end of which is a crank. This hy means of a connecting rod attached to the cradle, which is hung from the framework at the end of links, hy universal joints, gives it a rocating motion to the extent of the throw of the cam, and hy means of cords attached from the sliding-piece to the front of the cradle, which it alternately shortens and lengthens, tips the cradle from side to side, the reciprocating motion of the cradle continuing all the time.

The smaller particles of dirt which escaped the hopper, or tailings, fall into the bottom of the cradle, which is furnished with a gutter to contain quicksilver; from this the sides of the bottom slope upward to the outlets which are at the side, so that the gold remains in the gutter con-



LAY'S VIBRATING QUICKSILVER CRADLE FOR WORKING PLACER GROUND.

quick, vibratory motion, as an ordinary shaking table. This motion, with the aid of the hopper, separates the coarser particles from the finer, and delivers them at the wheel-end of the cradle and at the same time entirely prevents the dirt setting. On the countershaft are speed pulleys, which work, hy means of a helt, two other pulleys attached to a shaft on the upper crosspiece; the end of this shaft carries an endless screw working into a wheel of 16 teeth. On the axis of this wheel is another wheel, which has the teeth cut away from ahout two-thirds of its periphery; this engages with another, which at each opposite side has one tooth left uncut, hut is hollowed out to receive the plain part of the driving-wheel. Thus at each half revolution it remains stationary until the uncut portion of the driving wheel has passed. When this happens an extra-thickness case on the side of the driving-wheel lifts a detent spring that falls into the hole drilled in the plain part of the follower, and insures the true engagement of the teeth. Now this follower has a cam on the other end of its spindle, which gives a reciprocating motion to a sliding-piece on the hack of the crosspiece, consequently this sliding-piece has an intermittent recipstantly covered hy a small amount of loose dirt. A small pump at the hack of the cradle furnishes the requisite amount of water, which may he reduced to very little when scarce. This machine, which is in use in Australia, could he applied to working the "dry placers" of this continent, since, while some water is necessary, a very small quantity will suffice.

THE Geographical Society of California held its annual meeting on Wednesday night. Pres. David Starr Jordan presented his report covering the work done during the year just passed, and making recommendations for the future conduct of the society. The report shows the total membership to be 420, of which number 37 are life members. Receipts for the year amounted to $3492, and the disbursements $3452.40. Much valuable literature has been donated to the society during the year, and the library is now well supplied with maps, atlases and charts. All of the present officers were reelected to serve during the year with the exceptions of Directors Emeric and Hall, who are succeeded by Andrew J. Maguire and Dorville Libby.

THE TECHNICAL SOCIETY AND THE MAP.—It seems that the Technical Society of the Pacific Coast did not, as stated, oppose the plan of the proposed topographical map of the State. At the April meeting, Prof. W. D. Johnson addressed the society, explaining his plan. Upon motion, it was ordered that the society indorse the plan proposed by Prof. Johnson, and to lend him its hearty cooperation in his endeavors to secure the approval of the authorities of the State; and that a committee of three be appointed to confer with Prof. Johnson in effecting a plan of procedure. The Chair appointed Messrs. Grunsky, Curtis and Vischer, and instructed them to call a meeting for the special purpose of agitating this question; to invite the officers of the State Mining Bureau, the professors of the universities, the State and Federal officers interested, and the reporters of the principal newspapers, in order to create, at once, a public interest in this subject. At the December meeting this committee reported back, with its indorsement, a more detailed statement of the plan, and after much discussion, was instructed to take part in draughting any hill that might he prepared for legislation.

THE total number of steam vessels inspected last year on the Pacific Coast Division of the steamboat inspection service was 679, with a net tonnage of 150,270,58. The total number of officers licensed was 3282. There are five divisions, the Pacific Coast, the Atlantic Coast, the Western Rivers, the Northern Lakes and the Gulf Coast. The Pacific Division holds the fourth place in respect to the work done,

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings; Assessments, Dividends, Etc., 406-407.

MINING SUMMARY.—From the Various Counties of California, Nevada and other Pacific States and Territories, 405-406.

Comment.

On another page we print an interesting letter treating of the new mining district of Monte Cristo, near Seattle, in the State of Washington. That the writer limits himself strictly to "a narrative of facts" the manager of the PRESS (who visited the district a year ago) is able to verify. The new district is one of those rare finds where nature has done all the prospecting, leaving the ore veins exposed in plain view. Upon the promise of these natural exposures, something like two millions of dollars have already been spent in railroad-building, etc. A road connecting the district with tide-water, a distance of about fifty miles, is all but completed, and a smelter and reduction works are well under way.

The miners of the silver States are greatly disappointed at the apparent failure of the Monetary Conference at Brussels to help the cause of silver. America alone stands out for the white metal, and it is evident that bimetallism has received a decided setback. Silver has fallen to a very low figure and from all the silver-producing sections come reports of mines closing down. In Colorado, the leading silver State, hundreds of mines, large and small, are curtailing operations or closing altogether. So many men are being thrown out of work that a material influence is exercised on the general condition of trade. In that State large districts are entirely dependent on mining. In Nevada there is a constant depopulation of towns which a few years ago produced thousands of dollars in silver. The Carson river quartz mills, which used to run 328 stamps daily, now operate but 66 stamps. In most of the silver camps very little is being done. Montana is not quite so badly off, yet a number of small silver mines have been compelled to stop work. The State now depends on its copper and gold mines more than on its silver. The Hecla is the only large silver mine which has closed on account of the low price of the metal. The greatest producer of all, the Granite Mountain, is running along as usual, as is the Elk Horn and a dozen other big companies. Of course the profits of these companies have been seriously affected, and if silver goes to 75 cents an ounce not a silver mine in the State will be worked. The greatest damage inflicted on Montana by the depressed price of silver is due to the fact that there is absolutely no sale for a silver mine and but little demand for shares in a silver-mining company. On the other hand there is a great boom in gold-bearing mines, and during the past six months a score or more of great mines, abandoned during the boom days of silver, have been taken in hand by their owners and men put to work developing them. Utah is sharing the depression in silver properties, though not to so great an extent as other regions. In California the question affects our mining population with less directness. We do not produce here quite a million a year in silver. San Bernardino yields most of this, the other counties turning out comparatively small amounts. It is evident that investors will fight shy of silver properties until such time as the metal has some chance of resuming its former position.

THE storms thus far this winter have been highly beneficial to the miners of the placer and high-gulch diggings in the mountains, who have all been busy washing up considerable pay gravel on hand by sluicing. If we have more storms soon, they will be able to continue operations right along during most of the winter, whenever the weather is not too cold to freeze up the ditches and small creeks. In the northern part of the State there are many of this class of mines which pay well during the winter season. It does not take much capital to carry on this class of work, the claim, water and work being all the necessities. In some other kinds of mining it needs money in addition to these features; and, when that is the case, companies take the place of the individual miner.

Diamond Mining in the United States.

The Idaho diamond excitement may amount to something, but we doubt it. No expert in gems or diamantiferous material has expressed any favorable opinion of the ground or the product—if product there be. Prospectors ignorant of this branch of mining have made all the talk about these fields, and diamond prospects excite men more even than gold. More diamonds have been found in California than in any other State in the Union, but they were all small. Several times local excitements have been raised near the gravel mines by diamond finds, but nothing of value, as a field, has been found here or elsewhere in the United States. In fact, a very limited number of diamonds have been found in this country. They are met with in well-defined districts in California, North Carolina, Georgia and recently in Wisconsin, but up to the present time, the discoveries have been rare and purely accidental. These occurrences are chiefly confined to a belt of country lying along the east flank of the southern Alleghenies, from Virginia to Georgia, of Archæan and Cambrian age, and another along the western bases of the Sierra Nevada and Cascade ranges in northern California and southern Oregon. In both districts, the diamonds are found in loose material—the debris of the crystalline rocks of the adjacent mountains. They are in these places usually found among deposits of gravel and earth, associated with garnet, zircon, iron sand, anatase, monazite and particularly gold. The rocks in the diamond-bearing localities of the southern States are mainly granite, and the mode of occurence approaches that of the diamond fields of Brazil and parts of India, but differs entirely from that of South Africa.

In both the regions referred to, as well as Plum Creek, Pierce county, Wisconsin, the diamonds have been found in the search for gold; and in the South and in California, in placer mining, in the flumes and sluices of the hydraulic mines, and in California, frequently, in the batteries of stamp-mills. They have often been overlooked, unrecognized, or destroyed by rude methods of testing.

Mr. George F. Kunz, the gem expert of Tiffany & Co. of New York, who wrote the chapter on "Precious Stones," for the census, sums up the finds of diamonds in this country as follows: The octahedral diamond, weighing 24.75 carats, at Manchester, opposite Richmond, Va., in 1854, which was cut into a gem weighing 11.34 carats; about 100 diamonds, weighing 0.25 carats to 5 carats, in North Carolina and Georgia; about 200 diamonds, from 0.5 carats to 4 carats each, in California; two diamonds in Nevada; seven small ones, some weighing as much as 1 carat, at Plum Creek, Wisconsin; and a few isolated diamonds reported from Idaho, Arkansas and Kentucky. From this authentic record, it will be seen that in number California is ahead, though the value of the total would be small. Thousands of tiny little diamonds were found in the washings of the hydraulic mines, notably at Cherokee, Butte county, and thereabout. They were of no intrinsic value, and no systematic attempts have been made to save them while washing the gold. It would take very few diamonds of any size, however, to attract attention of prospectors and bring about newspaper talk. It is possibly for this reason that the Idaho claims are now to the front. Small diamonds have been found in Montana, and a year or so ago there was much talk of what was to be done in that State, but thus far, none of the diamonds have been placed on the market for sale.

CONTRARY to expectation, the contract for completing the work on Humboldt bay, under the provisions of last year's river and harbor bill, was let Monday to John Bull of Humboldt. His bid was $800,000.

A New Departure in Smelting at Leadville.

During the past year, Leadville, Colo., has taken a new departure that seems to promise a great increase in its production. For several years the lead-silver smelters have suffered for the want of lead, the ores that have been mined containing an insufficient amount of lead to take up the precious metals that they contain. The principal Leadville smelters have been forced to reduce the lead contents of their smelting mixtures to ten per cent or less, and in so doing have exhibited an amount of skill and originality that has not only compelled the highest encomiums of the European scientific journals, but has even caused them to express serious doubts as to the possibility of profitable smelting under such adverse conditions.

The cause of this decreasing proportion of lead to silver has been the constantly-increasing depth of the Leadville mines, which have long since penetrated below the zone of oxidation and reached the primitive sulphide formation, in which galena and zincblende replace the fusible surface carbonates. Copper pyrites also appears in considerable quantities, while the lead minerals decrease, and for some years it has been a question whether it would not be more profitable to the smelters to totally change their methods of reduction and concentrate the precious metals into a copper matte instead of lead bullion.

The Arkansas Valley smelter, a branch of the Kansas City Consolidated Smelting and Refining Co., were the first to conform to the new conditions, and during the past year have erected an extensive copper-matte plant, consisting of crushers and rolls, a large battery of Brueckner's cylinders for calcining the ores, and a number of reverberatory and blast furnaces for smelting the calcined ore.

The copper matte produced at Leadville contains some 250 ounces of silver and 2 ounces or more of gold, and is shipped to the central works at Argentine.

It is here treated by the unique process of Hunt and Douglas, in which the matte is roughly calcined to a mixture of sulphate and oxide of copper, which is treated in stir tanks with a liquor containing sulphuric and hydrochloric acids. This dissolves the copper in the matte, which is converted into a protocbloride by the addition of an adequate amount of common salt.

Sulphurous acid, obtained from the calcination of sulphide ores, is then forced through the solution, which precipitates the copper as a white, heavy, insoluble dichloride, absolutely free from arsenic and antimony. This dichloride of copper is changed into an oxide of copper by the addition of milk of lime, and, being pressed into bricks, is easily reduced to metallic copper by a single fusion in a blast furnace.

The matte residues, consisting mainly of oxides of iron, containing all the gold, silver and lead, are returned to the lead-smelting process, for which they form an admirable flux.

In contrast to the complicated and expensive Levansea system of matte separation, as practiced at the Arjo works, this process is noticeable for its simplicity and cheapness.

The Latest Placer Excitement.

The gold placers near the mouth of the San Juan river, in southern Utah, not far from the Arizona line, seem to be creating a sort of old-fashioned mining excitement, something we have not had for many years. The accounts which we publish in our mining summary give some of the details of the new fields—that is, they are called new fields, but really are not. The country along the San Juan river and the Navajo reservation has been more or less prospected for years. Some placer ground has been found along the river, but none good enough to work with profit. This time some few men may have struck some rich spots and created all this excitement. The Mohave *Miner*, of Kingman, Arizona, says of this field:

Some three months ago, it is alleged, John Williams, an Indian trader, made a discovery of gold placers on the San Juan river, near its mouth. He circulated news of this discovery and in a few weeks nearly 300 claims were staked off. A company of railroad men sent the locators in to do the work. These same men put in their time since the location of the placers, until about two weeks ago, in locating quartz ledges, and, in fact, everything showing a stain of mineral. Now they give out wonderful stories of fabulous pockets of gold and other minerals in that snowclad region. This, in the face of the fact that no work has yet been done on the placer (?) claims, is ridiculous. The first hard work a prospector would do would be to go to work on a placer claim and not run around the country locating "bronco" ledges and receive a salary of $3.50 per day therefor. The San Juan country is now covered with snow and the people who have just gone in there will suffer untold hardships before they can get back to civilization.

The *Miner* probably has the right end of this story. These mines are so far off from here that the exaggerated stories reach us, as is usual in such cases. For a limited

gold field, the miner, to "get in," must he near at hand when the excitement first breaks out. If he has to travel a thousand miles or so he is apt to get left, as those near by will have the best of the ground, if not all of it. The talk about 50 miles of placers and the richest field ever discovered in the United States is nonsense, when it is known that for some years prospectors have been over this ground. That rich placers might now be found, which were overlooked by others, is probable, but this is not enough to draw some thousands of men away from their homes in winter to a wild and unsettled region. Old-timers in Arizona, who know that country, acknowledge that it falls short of being a mineral section. Of course, any one foot-loose and free, and with money to spare, could go to the new placers and try his luck; but men who are at work would be foolish to give up their jobs to wander off to southern Utah at this time of year on no better basis than the telegraphed reports, prepared by excited men ignorant of mining, and on information furnished by interested parties.

Foundry Notes.

Business continues rather dull among the foundries, nearly all complaining of lack of work. It is evident that the larger iron works of the city will have to follow the lead of the Union and go into shipbuilding as a leading feature. This the Fulton has already prepared to do, and the Risdon, which now does considerable marine work, will take steps toward obtaining better facilities. This being the greatest seaport of the Pacific, there is more or less repair work always offering, and with more complete facilities, more will be done. Cheaper drydockage is greatly in demand, the present prices charged being so heavy that large vessels do not go on the graving dock unless absolutely compelled to, preferring to take their chances at other ports. With several good large drydocks along the bay-shore, there would be much more business done. The Union works now has one, and the Fulton will have another. These, added to the small Merchants' drydock and the big one at Hunter's Point, give a goodly number. The Risdon will doubtless build one in the near future, and Turner, the Benecia shipbuilder, talks of having one at San Francisco. Possibly the ironwork, etc., of the old floating docks of Mare Island Navy Yard, soon to be sold, may be utilized for similar purposes here.

The fleet of steam schooners running on this coast have done much to bring forward marine work in our foundries. Formerly all the small coasting trade to the lumber ports was done by sail, but now the steam schooners have largely displaced the sailing-schooners. The engines, boilers, pumps and other machinery of these vessels have been built in this city, and are as good as can be fonnd in any part of the country. The types of engines are the most modern and approved, and are economical in fuel and operation.

It has been demonstrated practically that not only can first-class warships and cruisers be built here at economical figures, but large-sized passenger steamers as well, so that all classes, large and small, may be constructed advantageously in San Francisco.

There is room for more of this work to be done and the business will not remain in the hands of one company alone much longer. The credit of advancing this interest to its present position rests with the Union Iron Works in the matter of the largest vessels, though the other foundries have long been doing their share of smaller marine work. They would have sooner competed in the large class had their facilities for docks, wharves, etc., permitted. These, as stated will soon be provided, and it is to be hoped that there will be enough work to go round among them all.

The Monterey has received aboard the last of her heavy guns, been in the dry dock for cleaning, and on Saturday will be tested in the bay. A few hundred tons of pig iron will bring her to sea-going trim. Capt. Chas. Minor Goodall will have charge of the vessel during the trial, and will run her straight away from Mission Rock to Red Rock, about 11 miles. She will not go outside, but the horsepower tests will all be made on the bay. The Union Iron Works people are nearly through with what they have to do on the vessel.

Martial Hainque, who died on Sunday, was well-known among the foundrymen here, being proprietor of the Cyclops Iron Works. He had resided in this city 38 years. He came here in 1854, from France, with his father, and after a few years' service with the late Frank Curry, proprietor of the San Francisco Boiler Works, as bookkeeper, he, in 1858, entered the Vulcan Iron Works as an apprentice and learned the trade of machinist. He established the Cyclops Machine Works at 115 and 117 Beale street about 18 years ago, and carried it on under the firm name of Tait & Hainque up to six years ago, when his partner, Mr. Tait, retired. He afterward carried on the business alone.

Personal.

FOSTER S. DENNIS, a mining capitalist of Kingman, A. T., is in the city.

S. A. STEWART has bought the Gipsy quartz mine, near Shasta, from George W. McDaniels.

JOHN MCCALL, of Trinity Center, reports a rich strike on abandoned ground near Minerville.

S. S. TAYLOR, who is arranging for the World's Fair mining exhibit of Plumas county, is in town.

T. B. BUNTING, who is interested in the Santa Cruz county bituminous rock deposits, is at the Palace hotel.

MAJOR FRANK MCLAUGHLIN, manager of the great river-bed mining operations at Oroville, is visiting the city.

H. AND J. PAIGE, J. E. and C. O. Drury have located in the Shasta mining district what is known as the Drury mine.

Mr. J. H. NEFF, president of the State Miners' Association, is still confined to his home at Colfax, by reason of injuries received last week.

A. C. HAMILTON, superintendent of the Potosi, Chollar, Bullion and other Comstock mines, has arrived here from Santa Monica, where he has been visiting.

L. S. HOLLIDAY of Ashley's Fork, Uintah county, Utah, is from a new mineral country which he says is very rich. The new district is about 90 miles from the railroad.

GEORGE A. MEEARS, manager of the Meears group of mines, Utah, has closed a contract with Philip Morgan, to sink the shaft deeper and explore some of the ground.

SUPERINTENDENT R. C. Chambers, of the Ontario mine, Park City Utah, has gone East. He says the resumption of dividends by the mine depends mainly on the price of silver.

THE comet medal of the Astronomical Society of the Pacific has been awarded to Prof. E. E. Barnard for his discovery of an unexpected comet by photography on October 12th.

A. P. MINEAR has transferred to the Bristol Mining Company the Trinity, Stonewall, Sitting Bull and Tehama mining claims and a 10-stamp mill, all in the Dog creek mining district.

PROFESSOR MORTON, superintendent of the Mammoth mine in Old Diggings district, Shasta Co., reports a rich strike, the quartz being liberally sprinkled with gold and running high in sulphurets.

PROF. FRANK SOULE, of the University of California, delivered a lecture on Wednesday evening in the hall of the California Academy of Scieuces on "The Development of the Science of Astronomy."

J. D. POPE, a former employee at the Bi-Metallic mill, Montana, has taken charge of the Algonquin mill for the McKechney Milling Co, and he is meeting with good success in the treatment of Puritan ore.

PROF. E. L. GREENE, assistant professor of botany at the University of California, has been promoted by the Regents to the professorship of that study. The compliment is deserved, since Dr. Greene is the most distinguished and skillful botanist in California.

JAMES PARK, who secured a bond on the recently discovered gold property of J. A. Brim and others, lying between Ely and Cherry creek, Nev., has gone to New York. The bond is for $100,000, and a payment is to be made in 36 days. Mr. Park is acting for a party of New York capitalists.

Coast Industrial Notes.

SALT LAKE is to have a large plant for the refining of asphaltum.

THE four-masted British ship Andelana, Captain Richards, arrived last week from Kuchinotzu, 80 miles from Nagasaki, with 3530 tons of Japanese coal, after an excellent passage of 37 days. Ships bringing Japanese coal cargoes to this port are rare.

THE mineral paint works of Messrs. F. Boehmer, Carl Petersen and Henry Mohres were destroyed by fire on Monday, resulting in a loss of $15,000, partially covered by insurance. The works were located on a hillside back of Fruitvale, Alameda county, near the Laundry Farm quarry, whither they were removed a year ago from the North Alameda tract. The machinery was expensive, having been brought out here from the East.

WORK is going right along on the Monadnock at Mare Island Navy Yard. The boilers, engines and auxiliary machinery will soon be put on board and completed as fast as possible. Considerable work of a minor character will be done about the yard buildings and officers' quarters during the next few months, in the way of putting in heating apparatus, painting, etc. A gang of wharf-builders has, during the past week, been taking advantage of the tides and working long into the night on the foundation of a piece of the new section of quay-wall under course of construction south of the stone drydock.

THE S. P. Taylor Paper Company intends to begin the manufacture of writiog and fine papers. The machinery is on the way, and the company expects to he in full operation not later than March 1st, and will give employment to not less than 100 hands, aside from twenty-five to thirty girls in the finishing departmeot. The S. P. Taylor Paper Company is the projector, the late S. P. Taylor having erected the first paper mill on the coast, as far back as 1856. In 1883 a new and much larger mill was erected alongside of the original plant, to which was added, a year later, a bag factory with an output of over 1,000,000 bags daily.

THE first of the new Spanish-American line of steamers to complete a round trip arrived Sunday when the Grandholm dropped anchor, fifteen days from Corinto and way ports. Her consignees are Otis, McAllister & Co., resident agents of the new company. The steamer's manifest shows a total freight of 1,122 bags of new crop coffee, divided by planters shipping from the three ports of San Jose de Guatemala, Champerico and Ocos. The new line has heavy engagements ahead of it, both up and down, and it is more than hinted that it will cut a prominent figure in the war between the Pacific Mail Steamship Company and the Panama Railroad Company.

THE Columbia river salmon canners' conference resulted in nothing. The object of the conference was to foster the salmon industry and protect brands and trade marks. All was perfectly harmonious on these subjects, but when the proposition to form a combination to protect the interests of the cannery men came up, the conference disagreed. It was stated that the canning business on the Columbia river had been carried on at a loss for several years, and unless some plan to keep up prices was agreed upon, serious results would be certain to follow. A plan of incorporating all the canneries on the river into one company and operating them under one management was proposed, but the diversity of opinion was so great that no definite result could be reached.

THE new canal scheme at Yuma is being pushed as rapidly as men and money will do it, and will, in all probability, be completed within the next year. The water will be taken out of the Colorado, a distance above Yuma, and will be distributed over the mesa lands lying in the Hermosa district, reclaiming hundreds of thousands of acres. It will not only be of benefit to the agricultural interests, but the mines will profit much thereby, and many that cannot be worked at all now, for lack of water, will be opened up. Mr. Blaisdel of the Yuma Pumping Company is erecting a system of pneumatic pumps that will supply the city with water at a very cheap rate, electric lights, ice and all the accompanying industries being included. The prison will be furnished with light and water by the same company at a much more economical figure than they necessarily cost now.

THE Haywards electric road has completed its track as far as Thirteenth and Webster streets, and early next week its cars will run into Oakland. The road will run from the Narrow-gauge depot to Clay street on the tracks of the Berkeley electric road, and on Washington and Clay streets it will share the franchise of the Piedmont Company. The latter has a franchise for a double-track road on those two streets, but owing to the narrowness of the streets only a single track was laid on each, the cars making a loop at Eighth street. The property-owners have bitterly opposed another track on Washington street, so when the Haywards road got ready to build on Saturday a large gang of men were put to work, and the job had been half completed before the property-owners knew what was going to happen, and before the threatened injunction could be brought. When the double tracks are finished they will be shared by the Fourteenth-street and Haywards electric roads and the Piedmont cable road, the first being a branch of the latter road.

THE flour-millers of California have ceased night work and have cut down wages and discharged a number of men. The men working in the mills are divided into skilled and unskilled workers, and as a matter of course their pay differs correspondingly. A practical miller's wages have for years been from $4 to $4 50 for a day's work of 12 hours. Floormen, sacksewers, drivers and laborers were paid correspondingly. The first intimation of a reduction came in the shape of an order that the sacksewers, who were paid $3 a day would only receive $2 50 hereafter. Then came a notice in many of the mills that the establishments, which had been for years running night and day without intermission, would no longer continue to operate at night, and that all men working on night shifts were discharged. This latter threw a large number of men out of work, and is the cause of much misery and malcontent. Among the shippers and dealers in produce there is no reason known why the mills should reduce wages and hours just now. There is no fall of prices and no surplus in the flour market, so that the action of the combine is considered quite arbitrary and uncalled for.

THE Adams Reservoir, Power and Irrigation Company intend to impound on suitable tracts to the north of the Arizona canal, a vast amount of water, to be drawn upon in times of scarcity and to irrigate new lands. The first reservoir will head at the Arizona canal falls. The north bank of the canal will be raised to a height of 25 feet, with a thickness of 15 feet on top, sloping away gradually on either side, so as to insure perfect safety. By means of this retaining dam, a lake will be formed four miles in length and over a mile in width. From this reservoir, a large ditch will be run, connecting with an equally as large reservoir several miles farther to the westward. Here the extent of the land as covered will be less, but the retaining wall will be built up to the height of 30 feet. These two reservoirs are filled with the surplus water of the great canal during the winter months, and their store of water will then be reserved until the summer. This will contribute a stream of 4000 miner's inches for six weeks before exhausted. The work will start at once, though it is not expected to be completed in time for any practical benefit to be experienced during the coming summer.

THE Igo and Ono mining districts in Shasta county are year by year increasing their output of ore, containing both gold and silver. Such as will bear railroad charges is sent to Vallejo Junction for reduction, comprising from one to two carloads a month. Now, as these mines are being developed and the output greater, is not there as much, or even more, being thrown aside as waste? If it could be shipped to some near point where charges are nominal, could it not be made to pay for reducing? The present outlook of these mines is that they are good for many years to come, and the owners are sanguine of their stability, which is vouched for by the fact of their expending large sums of money for machinery, etc. Not only are these mines receiving immediate attention, but there is a group of mines in the northern portion of this county

near Pitt river, which will soon be reached by the railroad operated now by the Shasta Lumber Co., that can be worked on a paying basis, provided cost of reduction and transportation was nominal. It seems to the Anderson Valley *News* that the prospects and stability of the surrounding mines, whose output of ore could be centered at that point, is sufficient for some person who is looking for a point to erect reduction works to give it earnest attention.

PLENTY of water is insured for next season, if the Truckee *Republican* is a true prophet. It says: "If all the snow that has fallen had remained on the ground without being packed down by the rain, we would have about six feet on the level. As it fell on dry, dusty ground, and there has been no such melting as causes the rivers and streams to rise, it is clear that all this amount of moisture is going into the ground. This insures plenty of water next year. The ground is not frozen at all, nor can it freeze until all this covering of snow disappears. The earth will be thoroughly soaked, and the valleys will see good times at the next harvest. Sometimes the ground is partially wet from rains when the first freezing weather comes, and in such years the snow that falls melts and runs away without penetrating the frozen earth. In such winters it makes no difference how much snow comes, the ground is comparatively dry in the spring. This year, it is safe to predict that nearly all the snow that falls will soak into the soil. Bodies of snow on the mountains are like great reservoirs, holding the waters for use in the springtime. A greater reservoir, however, is the earth which covers the mountains. If this earth can be filled with water, there is no danger of drouth. Every brook and rivulet will be filled with water until late in the summer."

THE Southern Pacific Company has commenced work on the Kentucky street electric road, which is the beginning of a work which will, in time, do away with several horse-car lines. During 1893 the company will build over 20 miles of rapid-transit lines, 15 miles of this being electric and five miles cable road. Material for the entire system has been ordered, and as fast as it arrives it will be put in place. The Kentucky-street electric road, now being built, begins at Fourth and Townsend streets and will run out Kentucky street to Railroad avenue to South San Francisco, covering a distance of about three miles. This will open up a part of the city heretofore comparatively isolated. Still more important is the Mission-street road, to be built from East and Mission streets, on the water front, out Mission street and Mission road to the county line, a distance of eight miles. Work on this line, which will also be on the electric system, will be begun about January 1st. While these two roads are being built, construction work will be begun on two connecting lines which will tap the most populous district south of Market street. One of these will run from the junction of Solano and Kentucky streets to Sixteenth and Mission, where it will connect with the main line. The other will start at Center avenue and run down Kansas street to Brannan, down Brannan to Sixth and down Sixth to Mission. Power for this extensive system will be generated at one central point and from there distributed over all the lines. The plant will be one of the largest of its kind in the United States and will consist of the most approved machinery. The new cable road to be built by the company will start at Bay street on the north side and run up Fillmore street to Market, and from Market out Church street to Thirtieth street. Eastern manufacturers of electrical appliances have received orders for designs of their latest improvements in electric cars and motors, and the new roads will equal any now in use.

The Pielsticker (Cyanide) Process.

1003 DEVISADERO ST., SAN FRANCISCO,
Dec. 11, 1892.

TO THE EDITOR:—In the Dec. 3d number of the MINING AND SCIENTIFIC PRESS, one of your able correspondents records a marked failure of the cyanide process at a mine in Placer county. This is only one of many, we fear, because it has been notorious all along that our most successful mining men and metallurgists have not been obtaining the results claimed by the owners and their allies. But now comes the Pielsticker method from London, and if half its advocates pretend and the following circular be true, we have now a really genuine cyanide process. The circular says:

The process for the extraction of gold and silver from refractory and other ores, concentrates and tailings by means of cyanide, has been known for many years; but it is only at a comparatively recent period that various difficulties have been overcome, which enable the process to be worked profitably on a commercial scale.

Although the working of the cyanide method has proved it to be far in advance of all other ways of recovering gold, yet several articles have remained to be overcome ere the process could be considered perfect. These difficulties have been the subject of many experiments and exhaustive trials, and have resulted in the Pielsticker (cyanide) process, which possesses advantages acknowledged by scientific experts and metallurgists to be in many respects unique and in advance of any other cyanide process.

The Pielsticker process will effect not only all that is claimed for other cyanide processes, but also:

1st—The method of working has been considerably simplified and its cost reduced.

2d—It has been found in practice that when treating the ore with cyanide, not only is the gold dissolved and extracted, but base metals are also attacked to a considerable extent as well. This is practically obviated under the Pielsticker process.

3d—The quantity of cyanide used is less than in any other process.

4th—By the Pielsticker process every kind of ore can be successfully and profitably handled, whereas the following difficulties have not been overcome by any other cyanide process:

(a) In many refractory ores the precious metals are so encased that the cyanide of potassium is practically inoperative on the gold and silver.

(b) Many ores containing base metals in the form of oxides and carbonates (particularly of zinc and copper) consume so much cyanide in dissolving them, that the extraction of the precious metals ceases to be commercially profitable.

The Pielsticker process is rapid and effective. The plant required is of the simplest character, cheap and easily managed. The loss, delay, and heavy expense attendant on roasting the ore is entirely obviated, while the process is equally adapted for the treatment of refractory ores, concentrates of both high and low grades, sludges, gold-bearing sands, and also ores containing base metals in the form of oxides or carbonates (particularly zinc and copper), which up to the present have not been successfully treated by any other cyanide process.

For the treatment of ores containing "fine" or float gold, the process is specially suitable, as the smallest particles even are absorbed by the solution. In this respect no other process can approach it.

Numerous companies pay small dividends or have ceased working altogether, notwithstanding rich assay results, on account of the refractory character of the ore, which cannot be handled profitably by the usual methods. The Pielsticker process, however, readily treats ores that have hitherto baffled all efforts at securing their valuable (but practically locked up) stores of the precious metals. The assay value, however rich, is frequently small indication of the practical results obtainable from working refractory ores that will yield neither to chlorination nor amalgamation.

The working cost of the process varies according to the nature of the ore and surrounding circumstances; from 8s to 15s per ton may, however, be taken as the average cost.

Then follows an expert's report verifying all the claims made for the process, and it is about as reliable as such things usually are. No hint is given as to details or manner of working, which is unfortunate, as people who have paid for their experience are somewhat cynical about taking anybody's word in regard to new methods for treating ores either by chemical or mechanical means. However, the missing information will trip along hereafter, no doubt, and let us trust that experiment will then prove "the coming process" has come at last. T. CALLAHAN, M. D.

Establishing Right to Unpatented Mining Claims.

SAN FRANCISCO, Dec. 10, 1892.

TO THE EDITOR:—In an editorial of week before last, you invite discussion of difficulties now encountered in the way of establishing right to unpatented mining claims, and ask for suggestions of remedy.

A suitable criterion of "mineral character" is not easy to establish. We may desire that all lands in localities known to be valuable for its mineral shall be regarded as mineral lands until the contrary is shown. But who is to determine what shall be the boundaries of such localities? And how long will it take to prove that any particular piece of land is not mineral? Can it ever be shown that it does not contain blind deposits?

It appears to me that before the Land Office can properly be called upon to reserve undeveloped ground for mineral claimants, it must be shown specifically what particular lands should be so reserved. This cannot well be done without some systematic investigation to determine the boundaries of our mineral districts. Some of our congressional laws are too loose; we require something more definite.

It is a notorious fact that the mining profits of many of our best districts have been expended in legal controversies. The most prolific sources of dispute have been:

1st. The granting of extra lateral right to lode claimants, *i. e.*, the right to follow and work a lode on its dip into neighboring ground.

2d. The absence of recorded proof of the exact boundaries of locations.

3d. The absence of satisfactory means of showing when a claim becomes subject to relocation.

It is thought by many that the Mexican law is better than ours in respect to these matters. Extra lateral rights are not granted. The government surveyor marks the boundaries of the location, and the claimant is officially put in possession. There is no requirement of annual work (under the new law), but the claimant is required to pay an annual rental to the Government.

Our mineral resources have been developed so rapidly, and there have already accrued extra lateral rights to such a vast number of lode-claimants, that it would probably be regarded as rather late to inaugurate a change in this respect.

However, a uniformly applicable remedy for the other difficulties might well be instituted without any conflict whatsoever with accrued rights I will sugest the following:

Let the present requirement of annual assessment work be dispensed with.

Let there be substituted an annual rental of $50 for each location until patent is obtained, to be paid to the U. S. Government, a readily accessible record to be kept.

Let the absence of such record open the claim to relocation.

Let the monies accruing from such payments of rental constitute a fund to be used for the benefit of the districts, as hereafter indicated.

Let the States be divided into suitable districts for the purpose.

Let there be appointed a competent mineral surveyor—a government official—for each such district, to reside in the principal town of the district, and to receive an adequate salary to be paid out of such fund.

Let it be such surveyor's duty to prepare a map of the district, showing all patented claims and all mineral locations which have been officially surveyed.

Let it be required that all unpatented claims, not already officially surveyed, shall be surveyed and properly marked under the direction of the mineral surveyor. Let this be done within a period of say one year after the appointment. Let the fees to be paid for such surveys be properly designated and be paid out of the above fund.

Let there be designated a proper system of marking the boundaries of claims.

Let it be required thereafter that all new locators shall apply for survey within say 60 days after the date of location.

Let the mineral surveyor be required to keep on file, subject to public inspection, a copy of the map of claims and a record of rentals paid.

Let copies of all such maps be filed in the Land Office and form the basis for determining what shall be regarded as "mineral land." This may be effected perhaps by the appointment of a properly-qualified commission to give the matter careful study, involving the examination of typical districts, and to formulate definite instructions to guide the various mineral surveyors in outlining the ground to be regarded as mineral.

Pending this work, let the miners' interest receive due regard; let there be some broad designation of the mineral belts, in which the lands shall be temporarily withheld from applicants for agricultural patent; let the listing of such lands to the railroad companies be temporarily stopped.

ROSS E. BROWNE.

Magnetic Separation of Zinc Ores.

In the dressing of calamine vein stuff at the Monteponi mines in Sardinia, an intermediate product is obtained, in the form of a mixture of zinc-silicate (electric calamine) and ochre, containing zinc and iron in extremely variable proportions, together with some dolomite, which minerals, being nearly all of the same density, are not susceptible of separation by the ordinary methods of dressing with water. For the treatment of this material a process has been devised by the author, consisting of a partial reduction of the ferric oxide to magnetic oxide, and separation by an electric magnetic apparatus, differing in many particulars from other machines previously used for the same purpose, which has been in successful operation since May, 1890.

The preliminary roasting is effected in an Oxland calciner, made of an old boiler shell, 13 meters long and 1 meter in diameter inside the firebrick lining, laid at a slope of 1 in 15 from the feeding end toward the firebox. The shell is surrounded by five hoops, four of which run upon the supporting friction rollers, formed of four pair of railway wheels placed with their axles parallel to the length of the furnace, while the fifth, in the center, is provided with toothed gearing, receiving motion from a screw, which turns the cylinder at the rate of 16 revolutions per hour. The fireplace has a horizontal grate of 1 5 square meter area, with a closed ash pit and airblast. A deep layer of fuel is kept on the fire bars, in order to produce combustible gas, which is afterward burnt by heated air, giving a long flame in the furnace. The ore, mixed with 2 per cent of finely-ground coal, is passed through the furnace, the iron being transformed to magnetic oxide and the dolomite rendered caustic. While still warm, it is spread out on a floor and slightly moistened with water, which slacks the burnt dolomite, disintegrating it to a fine dust, which remains with the smallest-sized ore after the magnetic separation, but is easily removed by a final cleaning in a jigging machine.

After cooling, the roasted ore is raised by a bucket elevator to sizing-drum, where it is classified into five sizes, with the limits 0, 1, 1.6, 3, and 6 millimeters. The four finer sizes are distributed by vibrating shoots, made of sheet brass upon the magnetic wheels, while the larger material above 6 millimeters is passed through crushing-rolls and returned to the elevator for sizing.

The magnetic wheels, of which there are four, one for each size of those classified, are all of similar construction. A central boss of cast iron, mounted on a horizontal axis, carries an even number (twenty is the figure) of radial poles, carrying bobbins wound with covered wire at their ends. The arms are covered by a cast-iron ring, bounded on each side by a disc of zinc. The winding of the bobbins is carried from one pole to another, forming a continuous closed circuit. Between each arm, a branch wire leads to the commutator, which is attached to one of the zinc side-plates. This consists of a number of copper strips, corresponding to that of the arms, which are arranged alternately, upon concentric circles in such a manner that the two brushes placed opposite to each other must be in contact with at least two segments at the same time. When the current from a dynamo is passed through the brushes, it is divided in the circuit of the bobbins, and excites opposite polarities in the two halves of the circuit, but as each brush is in contact with two segments of the commutator, no current will pass through the bobbin between them, so that the corresponding segment of the wheel forms a neutral zone between the north and south polar halves. The brushes are so adjusted that the neutral axis lies midway between the horizontal and vertical planes, so that the non-magnetic minerals in the mixed stuff, which is fed on to the top of the machine, fall off after passing the horizontal position, while the magnetized particles are held until the surface meets the neutral axis on the opposite side, when the attraction is broken and they fall into the iron-ore bin.

The rim of the wheel is in contact with the poles, and the magnets may be made either of cast iron or any non-magnetic material, such as zinc or brass. In the former case, although the magnetic attractive power is lessened, it increases regularly from the neutral zone to the position of maximum north or south polarity, so that it becomes possible to separate minerals of varying magnetic character from each other. The working surface is divided into cells, either by teeth or a grating of radial and transverse bars of iron, forming an armature which closes the magnetic circuit and concentrates the attractive power in the cells. The spacing of the bars, and the size of the apertures between them, varies with the grain of the material to be separated, the latter being kept to the right side by copper stops laid between the bars.

The magnetic wheels make from 12 to 20 revolutions per minute, and require an average current of 60 amperes at 30 volts tension, corresponding to a net electrical effect of 4-10 H. P., which is derived from a dynamo, which also serves for the electrical lighting of the works. The apparatus was set at work in May, 1890, and during the first twelvemonth about 5000 tons of crude ores, containing 20.17 per cent of zinc, were treated, producing 1530 tons of merchantable zinc ore of 41.67 per cent produce. During the present working year, the assay of the cleaned ore has been improved to 45 per cent.—*Oesterreichische Zeitschrift fur Berg und Huttenwesen.*

The Monte Cristo Mining District, Washington.

TACOMA, Wash., Dec. 7, 1892.

TO THE EDITOR:—The construction of the Everett and Monte Cristo railroad 50 miles eastward from Everett into the heart of the Cascades, is the most important movement yet made toward the development of the gold and silver mines of western Washington. The mineral wealth of the country is unquestioned; discoveries of varying value have been made along almost the entire length of the western slope nf the Cascades, from about Mt. St. Helens in Skamania county, to Ruby creek, close up under the boundary line of British Columbia. The extent, frequency and contiguity of these discnveries no longer permit of doubt that the section must become in time a great mining area. The opening up of Monte Cristo is the initial enterprise, projected on a large scale, in the mining activity of the country.

Physical conditions have hitherto prevented and will doubtless, to some extent, continue tn retard the rapid development of the region. The whole western slope from the mountains to the coast, is cnvered with an almost impenetrable blanket of forest—a literal jungle. Few trails, and fewer wagon roads exist. Again, the ores of the country are not, as a rule, especially high grade and little or no free gold has been found this side of the range. Placer mines are few and far between. Shipments by wagon over such roads as are to be found in the western half of the State are almost precluded. Railroads are an eminent necessity. Thus, though the existence of rich districts, notably that of Silver Creek, have been known for a number of years, such is the character of the country that it has been little prospected until the last two or three years.

The district of Monte Carlo was discovered three summers ago, but it has required the time intervening to interest the requisite capital to build a railroad in and provide for working nn a large scale. The road will open up several districts of fine promise, while the completion of the Great Northern road through to Everett will open up another tier of districts just to the south. These two roads will overcnme the most formidable barrier to successful working, and must lend a strong impetus to the mining activity of the section.

Monte Cristo, the present center of interest, lies in the depths of the Cascades, or, perhaps more accurately, in the spurs forming their western slope, at about the middle of the eastern line of Snohomisb county. The basin is at the headwaters of the Sauk river and is divided from the older district of Silver Creek, six or eight miles to the south, only by a clean range. It was discovered by J. L. Pearsall, better known as "Jo," in the summer of '89. Pearsall was an exschool-teacher, turned prospector. He had been knocking around Colorado and Idaho since the late Leadville excitement, and laoded in Silver Creek in the hey-dey of the latter's boom, "broke." It was curious that the lateral area of Silver Creek had been widely prospected and in that and the Troublesome and Howard Creek districts some 2000 locations had been filed, no attempts had been made 10 explore over the divide at the head of the creek. It was in this direction that Pearsall turned, armed with a grubstake and a fieldglass. The latter proved a valuable accessory and revealed a huge red stain, some miles to the north. The way to it lay across the thin edge of a hogback and over a huge glacier. Tbe ledge that attracted Pearsall's attention through the glass, he never reached tbat year, at least, but stopped as he came upon another of even greater extent. It proved a vein from 40 to 75 feet wide, rich with mineral, and exposed in its face from the bottom of the gorge, up 2000 feet to where it disappeared beneath tbe glacier. Planting his stakes, he named it in honor of its discovery on the 4th of July—"Independence of '76"

On his way down to Snohomish to place the location on record, Pearsall ran on J. M. Wilmans, one of the Wilmans Bros. who had just achieved their exploit with the Woodside mine at Park City, Utah. The Woodside was abandoned, when F. W. Wilmans, an Arizona mining man, came along, found the lost lead, leased the plant, and in the course of a few months took some $625,000 from the mine. F. W. Wilmans came on and returned with Pearsall to the scene of the latter's find. Further prospecting revealed several other immense ledges, exposed to a similar extent. These were promptly corralled, and the succeeding summer a trail cut through from Sauk City, at the junction of the Sauk with the Skagit. The next question was a railroad.

Just at this time, a syndicate of New York capitalists, headed by the banking firm of Colby, Hoy & Co., were undertaking to build a new manufacturing city at the point where the Snohomish river empties into Puget Sound, 30 miles north of Seattle. The new town, Everett, was the nearest point on the sound to the district, and its projectors saw the importance of making the latter tributary to their enterprise. The Colby-Hoyt interests undertook the construction of the road on a sufficient guarantee, and work was begun last June. The syndicate subsequently made some heavy investments in the mines, and now controls several of the leading companies. A coalition of interests was effected and the development of the district pushed forward on a broad scale. In all about $3,000,000 will be required for the work of development, all of whicb, in fact, must be expended before a dollar of return can be had. At Everett the construction of a smelter was undertaken by the Puget Sound Reduction Co., formed of the principal interests of Monte Cristo. Tbe cost of the present plant is $300,000, with facilities for enlargement as shipments shall demand. It will be completed this winter, and will be the largest smelter on the North Pacific. Three 80-ton stacks and two improved roasters, equal to six of the old pattern, will be employed, and the works equipped with modern devices througbout. The company has secured a fine location on the waterfront, facilitating easy handling of foreign ores.

The 50 miles of railroad through a virgin forest will require $1,800,000. A short and easy rnute was found up the south fork of the Stillaguamish, and over a low pass intn the valley of the Sauk, five miles below Monte Cristo. At the latter a concentrator will be erected at a cost of $250,000, and from this an extensive system of tramways will reach to the varinus mines.

Six principal companies are now operating in the district, controlling about two-thirds of the locations made. The Colby-Hoyt syndicate nwns a controlling interest in three, tbe Pride of the Mountains Co. owning the Pride of the Mountains, the Rainy Company owning the Rainy mine, and the Monte Cristo Co. owning the '76, Mystery, Emma Moore, Congress, Ibex, Pride of the Woods, and several others; Joseph S. Colby, of Cleveland, O, is president; F. W. Wilmans, of Seattle, vice-president; Chas. L. Rand, of Cleveland, secretary; Wm. C. Butler, general superintendent, and A. L. Dickerman, consulting engineer. The Wilmans Bros are in control of the Wilmans, Pearsall and Pearsall Blake Companies, owning the Monte Cristo, Onida, Alacante, Fourtb of July, Ironclad and several others. F. W. Wilmans is president; Edward Blewett, vice-president: J. M. Wilmans, treasurer; J. L. Pearsall, general manager of the Pearsall Co., and George Blake superintendent of the Wilmans Co.

The district of Monte Cristo is made up of two huge basins, from 2000 to 4000 feet in depth, parallel and joined at their western extremity, proceeding thence in widened and deepened course to form the valley of the Sauk. These great furrows have been ploughed through the mountains by two immense glaciers, drifting to the northwest on the back of the long bigb mountain ridge which parts the two basins; the remains of which old ice-monsters still lie, unmelting in hottest midsummer. The mineral ledges are found traversing the two basins in parallel lines, nearly at right angles to the basin's walls; they have thus been cut sharply across their face, exposing them to great depths. It is indeed in the surface showings that the district finds its most marked physical characteristics. The extent of this exposnre is something wonderful, and from its character established the immense resources of the district before any great amount of development work had been done. Nature had in fact done the development work, and a considerable share of the mining. Practically, all that is required is to run tunnels at feasible levels aod stope down tbe ore.

The ledges are traceable for a number of miles on either side of the district, and for the most part maintain nearly parallel lines. Thus, in their continuity, parallelism and the great depth to which they are exposed, they exhibit the strongest possible surface evidence of permanence. This had been thoroughly borne out by extensive development work in all of the larger ledges. The following presents the results of the work on the more important leads:

Pride of the Mountains mine—Between 300 and 400 feet of tunnels showing vein from 8 to 28 feet wide; solid ore body, 6 to 14 feet wide, largely galena, with some pyrite, b'code, aotimony aod arsenic; assays from $30 to $60 per ton. One hundred feet above tuonel, outcrop of 8 foot vein of solid galena assays $79 in silver and 58 per cent lead. This vein is exposed in a continuous outcrop for 4000 feet, cuttiog the mountain obliquely and forming a solid girdle of ore three-quarters of a mile long. There are about 3000 tons of first-grade, direct-shipping ore on dump, stoped from exposed face of vein at mouth of tunnel—quarried would be a better word.

'76—Three tunnels of about 100 feet each have been run in the country rock to tap the vein from beneath. Vein is exposed for a distance of about 2000 feet and is from 25 to 75 feet in width. It lies on one side of the huge mountain-spur or ridge which divides the two basins and outcrops on the opposite side of the ridge, indicating a solid mountain of ore. Assays from 28-foot face, $30 in silver, $22 in gold, and 26 per cent lead. The ore is for the most part a heavy concentrate carrying more gold than the Pride—is largely a galena and pyrite, averaging about $40 to the ton.

Monte Cristo—Three tunnels, tapping the vein at different levels, have developed a fine body of direct-shipping ore. The ore body is from 5 to 8 feet in width, in a vein 14 to 15 feet wide. The mine is situated in the same way as the '76, and on the opposite side of the ridge lie the Onida and Alacante. These latter will be worked by tunnels driven from and along the ledge of the Monte Cristo, the tunnels being from 2000 to 3000 feet long. Assays from various depths of long tunnel, maximum $98, average, $60 to $70. Tramways are now in place to the Monte Cristo, and with the completion of the railroad the mine will be ready to ship from 100 to 200 tons of ore daily.

Mystery—Two tunnels, one of 100 feet and a second of 150 feet, traverse vein of solid ore averaging 8 feet in width. The ore has been left standing and workmen are now drifting on through, following veio to opposite side of the mountain where it outcrops in Glacier basin. This is largely a gold-bearing rock, an arseno-pyrite, carrying no lead. The ore averages about $40 per ton, and a large quantity is ready to be stoped and shipped.

Rainy—Two tunnels of 150 feet each have opened up vein 20 to 30 feet wide, largely a gold rock, carrying no lead; assays from face of end of tunnel show $70; is largely a concentrating ore.

Emma Moore—Two tunnels cut three-foot seam of direct shipping ore, largely a galena, carrying $50 per ton.

Congress—The 150-foot tunnel opens up two seams of aggregate width of three feet. Assays from narrow seam at depth of ten feet showed $90 in silver, $35 in gold and 51 per cent lead.

Assays from pay streak of the Ironclad ran $100 to the ton, and concentrates from mine average $40 per ton. Development work in smaller mines has had proportionate results.

In general character, the ores of the district are a galena and pyrite, carrying considerable arsenic, some antimony and some blende. They may be said roughly to average from $30 to $50 per ton, and are about 60 per cent concentrates. The bulk of them are smelting ores, carrying heavily in lead, but some will require roasting and treatment. Taken as a whole, the mines of the district are remarkable not so much for the rich streaks of high-grade rock, but for the immense bodies of ore they contain. In several instances, as the '76 and Monte Cristo, the ore body is practically the thickness of the mountain, naturally "in sight."

I have in tbis account avoided anything partaking of the line of superlatives and confined myself to a narration of facts. These latter, if I mistake not, tell in a candid way of a district of marvelous promise that has been developed into something more than a promise—into a reality. It would be idle to say that the camp has the making of a Butte or a Leadville—nothing, in fact, is more eminently useless than predictions of mining camps. But this is certain, that neither Butte nor Leadville had, at their beginning, any such surface exposure of ore as has Monte Cristo. It was, in fact, on the strength of this surface showing that the origioal purchase nf the mines was made and all the attendant outlay begun. The purchase was made on the report of Mr. A. L. Dickerman, a mining expert of wide repute, and his judgment has been backed up by subsequent development done. All the work of the year has confirmed and emphasized the promise of the beginning. As the veins have been explored, the ore bodies have shown a tendency to increase in size and the ore in value. If any mining camp ever had an assured and certain future, Monte Cristo must be set down as one of sucb.

There are roundabout Monte Cristo a number of other districts of fine if not of equal promise. Eight miles to the southeast lies the Troublesome; six miles south is that of Silver Creek; ten miles southwest the Sultan; eigbt and twelve miles west Crystal Creek and Silver Gulch and the Stillaguamish. All of these will be reached by, or be accessible from, tbe Everett and Monte Cristo or the Great Northern, both of which roads are now nearing completion. Both roads center at Everett, affording cheap and short transportation to the smelter. The latter is rapidly becoming the center of the mining activity of the region. Capital, which has hitherto been shy and backward, is now beginning to flow into the region, and the indications are that the immense mineral resources of western Washington will speedily find tbe development they have long awaited.

CARL SNYDER.

Simplicity of the Cyanide Process.

LOS ANGELES, CAL., Dec. 10, 1892.

TO THE EDITOR:—It seems to me that the merit of the cyanide process lies as much in its simplicity as in its efficiency. It does not require any argument to prove that the more complicated a process is, the less its commercial value. As it now stands, the process certainly is simplicity itself, consequently any proposed improvement must not only be *an improvement*, but must be of sufficient advantage to compensate for increased complications and difficulty of manipulation.

Let us examine that portion of the process which apparently offers the greatest field for improvement, namely, the precipitation. The solution contains the dissolved gold in the form of a double cyanide of gold and potassium, together with the silver and perhaps a very little of the base metal. For all practical purposes, however, the latter may generally be disregarded after it has found its way into the solution This solution is passed through a filter of zinc shavings and the gold is precipitated upon the zinc. The precipitation consists of a simple replacement of gold or other metals in solution by zinc. The precipitate, when dried, is ready for sale to the refiner. When desired, it can be melted with a flux of sand, borax and bicarbonate of soda and run into bullion at the works.

The objections to this method of precipitation most generally advanced are that the grade of the bullion is lowered and tbat the strength of the cyanide solution is reduced by contact with the zinc.

As to the first objection; from a metallurgical point of view it certainly is desirable to obtain as nearly a finished product as possible, but from a practical standpoint I can really see no difference whether we dispose of an ounce of bullion .666 fine for $13 75, or .78 of an ounce .850 fine for the same sum, provided that the cost of production is the same in both cases.

The second objection to the use of zinc as a precipitating agent appears to be equally without foundation. It has been shown tbat the value of the cyanide consumed is often as low as 75 cents per ton of ore treated. Of this amount a very small per cent is actually required to dissolve the gold, the balance being wasted in other reactions before it reaches the zinc. This wasting may occur from a number of causes, the most prominent being a considerable amount of base metals in the pulp under treatment; undue exposure to light and air, or a degree of acidity of the pulp too slight to be readily noticed. But whatever the cause, tbe loss will be found to occur in the ore-tank, or at least before the zinc is reached.

When the filter is in proper condition and the time required for precipitation has been determined, it will be found that the actual loss in the strength of the solution in the zinc-box is too slight to be determined by the ordinary tests; it is certainly less than five cents per ton of ore treated. Surely, this is not a very promising field for improvement, especially when the extreme simplicity of the present means is considered. That zinc will precipitate the gold completely cannot be questioned. I have repeatedly failed to find over a trace of gold in a solution which was passed through a filter in proper condition.

Allowing that it costs five cents per ton of ore treated for zinc (which appears excessive), and tbat a loss of five cents per ton also occurs in the strength of the cyanide solution during the process of filtering, it gives a cost of but 10 cents per ton, whicb certainly leaves little to be desired in this direction.

It is more than probable that the present cost of potassium cyanide will he materially reduced. Zinc is cheap enough already. The cyanide process has come to stay, and what is more, the only improvements that are likely to be made in it for some time to come will be in tbe manipulation. It may take an expert chemist in many cases to determine the condition of working, but once these are established, any one of average intelligence can conduct the operation as long as the nature of the ore being treated undergoes no marked change.

There is a mistaken notion current that the cyanide process is a rival of amalgamation. Such, however, is not the case. Each covers a field that the other cannot profitably enter. It is the exception to find an ore that can be treated with equal advantage by either process, although both will frequently be found beneficial. The cyanide process, in taking its place in the front rank of the metallurgy of gold, displaces no one, antagonizes no one; it simply fills a gap that has long been open.

FRANK ALDERMAN GARBUTT.

Mechanical Progress.

Blue Printing.

The usual process of making blue prints is to coat one side of the paper, using for the purpose a brush or a sponge, with a mixture consisting of one drachm of the red prussiate, and one and one-half drachms of the ammonia citrate of iron, dissolved in about one ounce of water. This amount of solution will be sufficient to coat several large sheets of paper, but it will not keep a great while after being coated. The surface is yellow when first coated, and after a week or so will have turned to a dirty greenish color. It can be used in this condition, but makes inferior prints. It is better to make up some fresh solution, for it only takes a few minutes to dry the paper ready for use after the coating has been spread on. Then a sheet of it is put under the tracing, and exposed to sunlight under a sheet of thick glass, or in a regular frame for making blue prints. After exposing until the parts of the paper not protected from the sunlight have turned to a kind of "greenish granite" color, the print is removed and washed in clear water until the yellow color stops coming from it. Then the print is hung up to dry.

In order to make a blue print with blue lines on a white ground, two methods are open. The first is to make a print which may be called a "negative," and then to make the blue-line prints from that instead of from the drawing itself. The reader can readily see that if a print from a transparent sheet, with opaque lines thereon, will give a copy that is opaque with transparent lines, then by taking another print from the first print there will be opaque lines on a transparent ground again, similar to the original drawing. But there is one drawback to this method which is fatal to its success. That is, the blue print which is made from the original will not work when used as a negative, because, being of a blue color, the rays of light which shine through the color will affect the sensitive sheet fully as quickly as the rays which shine through the transparent or white paper. In fact blue is one of the actinic colors, and likewise one of the most actively actinic of them all. Now, if the print taken for a negative could be black, yellow, red, or any of the nonactinic colors, there would be no more trouble in printing a blue print from it than there is in printing one from the original tracing.

It is in order, therefore, to look around for some means of making a print which will be nonactinic. To this end, it is best to get a sheet of "silver paper" from a photographer, or, what is easier, get him to make a print of the tracing on silver paper. Then, after it is "toned" and finished, it can be used as a negative for the making of as many blue-line prints as may be desired. The other way of making a blue-line print, or, in fact, one other way, is to make up a kind of blue-print paper which will turn blue only where the sunlight does not hit it. This is a little different from the first kind of paper described, and the difference is that this kind is charged with chemicals which the sunlight has the power of destroying the color thereof, instead of setting the color, as in the case of the ordinary blue paper already described. For the present it will be sufficient to state that the paper is prepared by mixing together three solutions, then mixing the three into one when ready for use, and spreading it on the paper as if for a simple blue print. The three solutions are: Gum arabic six drachms, water 30 drachms; ammonia citrate of iron four drachms, water eight drachms; perchloride of iron 2 5 drachms, water five drachms. As these things will keep separate, they can be mixed in larger quantities; for instance, taking ounces for drachms; then the quantity that is to be used at one time can be taken of each, let it be in drachms, half-drachms or minims. The paper will also keep well after it is sensitized, so that a quantity may be made up at one time and kept from the light till needed. The reason that this kind of paper will keep, while the other will not, is because the common paper turns upon exposure to the light, while this kind will not turn, even in the developing solution, if exposed to the light. The paper is printed in the usual manner, then it is floated upside down on a solution of potassium ferrocyanide, one ounce; water, four ounces.

The paper must be floated on top of the mixture, because it will stain the back of the print if any of it gets thereon. After the lines get blue enough, as may be determined by turning up a corner of the paper occasionally, it should be removed from the "developer" and floated on clean water, which will at once stop the process of turning any darker. If there be any blue spots left on the paper where they don't belong, *i. e.*, except on the lines, they can all be cleared off by putting the sheet of paper in (no need to bother with putting on top this time) a solution of eight parts muriatic, three parts sulphuric acid, with 100 parts of water. After the blue spots have disappeared, wash well in water, dry, and a print with rich blue lines on a white ground is the result. This kind of a print, the "blue positive," may be colored; something which cannot be done with an ordinary blue print.—The Tradesman.

Loss of Heat from Boiler Scale

It has been held by many that one-eighth inch scale in a boiler causes a loss in fuel of 28 per cent. It will be interesting to read what E. M. Herr, superintendent of the Grant Locomotive Works, says in the *Railway Master Mechanic:* "In some recent tests made on a prominent western road," he says, "the average temperature in the smoke-box of two locomotives was measured under as nearly similar condition of operation as possible, the only difference being that the boiler of one engine was clean and free from scale, while that of the other so badly scaled as to necessitate stopping it for removal of flues and the cleaning of the boiler. The pyrometer averaged but 25° higher in the dirty than in the clean boiler, with an average temperature of about 550°. This test is corroborated by similar tests on another road coming under my personal observation. A comparison of the fuel record of engines from each of whose boilers as much as 4000 pounds of scale and mud was removed, also discloses no such great loss in fuel economy as this paper would indicate, but, on the contrary, shows no more than 4 or 5 per cent loss which the pyrometer tests give. These boilers were covered with a combined sulphate and carbonate of lime scale, averaging certainly upward of one-eighth inch in thickness.

"The bad effect of scale upon the life of boiler-sheets and flues is unquestionable, and rather under than overstated in the paper. That a large saving in boiler repairs and all the attendant expense and loss of revenue from unserviceableness of the engine can be made by keeping the boilers free from scale has often been shown, and it is here, rather than in an extensive gain in the fuel record, that the economy and advantage of clean locomotive boilers is to be looked for."

Silk from Wood Pulp.

United States Consul Francis B. Loomis, at St. Etienne, in a report to his Government, gives some interesting facts regarding the proposed manufacture of silk from wood pulp. It appears that the reported failure of the silk crop or output in France, Italy and Syria has again directed the attention of some of the most important manufacturers of St. Etienne to the process invented by Count Chardonner for the manufacture of silk from wood pulp by a method similar in principle to that employed for converting wood into paper. A few years ago the new invention was exploited, and the rights to its exclusive use were sold to companies in Germany, France and England. Large works were built at Besancon, and preparations for manufacturing silk from wood were projected and made on a somewhat extravagant scale. Some remarkable specimens of silk made by this process were shown, but it was found that the fabric so manufactured could not be woven successfully in large pieces, and that it was of so highly inflammable a nature as to be a source of great danger. The experiments were then dropped, and nothing was heard of the matter until a few months ago, when a company was organized to develop the process of Count Chardonner and make it a thoroughly practical one.

This company is quietly at work now, and is making a large number of experiments, which, Mr. Loomis is informed by those in a position to know, are likely to lead to some important and satisfactory results. It is believed that in a short time the company will be able to offer to the trade a substitute for silk which will possess all the essential qualities of silk, and which can be sold for less than half the cost of the genuine article. This company has secured the revision to itself of the exclusive rights to the process, which had been sold, and if its experiments meet with the success that is anticipated, it will be in a position to make its own terms on every side. Consul Loomis has secured interesting samples of ribbons made from wood pulp or cellulose silk, which he sent with his report to the department. Up to the present moment these experiments are more interesting than important, and the silkworm rests secure in its work and its career, but nobody can tell at this early stage of development the wonderful things that the future has in store for wood pulp.

Scientific Progress.

Misuse of Quinine.

In an article in *Science*, Dr. W. Thornton Parker says:

Few, if any medicines, enter so largely and generally into popular use as quinine. Throughout the world we find it almost everywhere for sale; it can be purchased in any quantity by anybody, and used as the the purchaser may think best, in larger or smaller doses, at intervals, or continually. Few seem to understand its poisonous action, or even suspect that its continual use can result in any special injury to the system. It is prescribed by all sorts and conditions of men, women and children. Ruse, in his excellent text-book of medical jurisprudence, defines a poison as "a substance which, when introduced into the body by swallowing or by any other method, occasions disease or death; and this is an ordinary result in a state of health, and not by a mechanical action. It must be as an ordinary result; a substance, for example, which affects one person injuriously through idiosyncrasy, is not to be called poison. Again, it must be *in the healthy system*, as is well known, many diseases render the system extremely susceptible to impressions by external agents, e. g., in gastritis, the blandest substance, even water, may excite vomiting."

The action of the malarial poison upon the system is of such a nature that many would claim that any abnormal nervous impression would be more likely to have its origin in the malarial poison than in the quinine, which is given with a view to neutralizing that poison. We know of so many diseases following the inception of the malarial germs that any attack upon quinine, as a poisonous remedy, may reasonably expect prompt resentment. Ringer states, that "large doses produce severe frontal headache with dull, heavy, tensive, and sometimes agonizing pains." While these symptoms last, and, indeed, generally before they appear, the face is flushed, the eyes suffused, and the expression is dull and stupid. Even small doses in persons very susceptible to the action of this medicine will produce some of the foregoing symptoms, especially the headache and mental disturbance. Many of these symptoms are, no doubt, due to the action of quinia on the brain. In toxic doses it excites convulsions.

"Cbirone and Curc find that the removal of the motor centers of the brain prevents these convulsions; and, if the central hemisphere is removed on one side, the convulsions are unilateral. Albertoni, on the other hand, finds that quinia will induce convulsions when the central hemisphere or the cortical motor centers are removed." Dr. Bartholow states, that "In full medicinal doses, as the quinia accumulates in the brain, a sense of fullness in the head, constriction of the forehead, *tinnitus aurium*, more or less giddiness, even decided vertigo, may be produced. In actually toxic doses all of the above symptoms have been intensified. There are intense headache with constriction of the forehead, dimness of vision, or complete blindness. deafness, delirium, or coma, dilated pupils, weak, fluttering pulse, irregular and shallow respiration, convulsions, and finally collapse and death." Dr. Wood states, that "The minimum fatal dose of quinine is not known, but it must be large, and probably varies very much." Brown-Sequard states, that "In epileptics the attacks are rendered decidedly more frequent by the cinchona alkaloids." Dr. Wood is of the opinion, also, that "In large doses quinia, without doubt, abolishes the functions of the cerebrum."

From the foregoing we have evidence to demonstrate that quinia is too dangerous a remedy to be prescribed recklessly by medical men, and that its popular use by people ignorant of its action should be condemned and, if possible, prevented.

THE MANUFACTURE OF LENSES.—In the city of Munich is one of the most celebrated lens manufactories in the world, its wonderful products being in demand in all the countries of Europe. The perfection characterizing these lenses is due to the unvarying precision and faultlessness of work applied to every object produced before it is permitted to leave the Steinheil establishment. The lenses, after being roughed out in cast-iron molds by hand, are ground fine by means of emery powder and water in glass molds, each workman being provided with a glass model of the surface to be imparted to the lens (such surface in all cases being spherical,) and each is tested to see that it has received its proper curvature by means of a so-called spherometer. The different operations of grinding, finishing, polishing, centring, etc., are all performed by separate workmen, who are practiced in one of these particular branches only.

NEW PIPETTES FOR MEASURING LIQUIDS.—A new pipette for measuring volumes of liquids has been brought out by M. Roy before the Societe Industrielle, of Rouen. Every one who uses the ordinary form of pipette knows how difficult it is to obtain the exact volume of fluid, and it is to overcome this difficulty that M. Roy's new pipette has been designed. It is made in two parts; one, the portion to contain the measured volume of liquid, being made of the same shape as the old pipette, but made only large enough to hold the required quantity. (If an ordinary pipette be taken, and the stem be cut off at the mark, this portion of M. Roy's pipette will be obtained.) The second portion, which is the novel feature of the instrument, consists of a glass tube with a wide cylinder blown on the end; this cylinder fits over the bulb of the pipette, a tight joint being made by grinding the two contact surfaces; a piece of rubber-tubing with a pinchcock and a finger-hole in the side of the covering cylinder completes the new instrument. It is used by placing the finger over the side hole, inserting the end of the burette in the liquid of which a known quantity is to be measured, then drawing with the mouth at the other end in the usual way, until the fluid flows over the end of the measuring portion into the cylindrical cover; the pinchcock is then closed, the pipette placed in the vessel into which the liquid has to be delivered, and air admitted through the fingerhole in the side, when the liquid in the pipette flows out.

A PLAN to light by electricity the tracks of the Pennsylvania railroad between Broad street station and Bryn Mawr, on the main line, and between Frankfort and Broad street, on the New York division, is under consideration, says the Philadelphia *Record*. If the project materializes, there will practically be no further use for headlights on the locomotives running between these points, and should the line of electric lights be continued all the way to New York, which is neither impractical nor improbable, the entire roadway will be as light as day at all times, rendering headlights absolutely useless. The company is now constructing a mammoth electric light plant at Sixteenth and Filbert streets, which would afford ample facilities for an extensive circuit of lights if established, and there is enough land adjoining now in the possession of the company to admit of extensive additions should they be needed. General Agent Latta states that the matter has been talked of for some time, but that nothing definite has been done in the matter.

QUANTITATIVE DETERMINATION OF LEAD.—In operating galenas, Herr Ludwig Medicus adops the following method: After converting the lead into a chloride, he dissolves the lead chloride in potass-lye, and passes a current of carbonic acid through the solution for two hours. The precipitated carbonate is filtered off, washed, dissolved in nitric acid, and the lead is precipitated electrolytically as peroxide. He attempted also to precipitate the lead from the alkaline solution as peroxide by means of bromine. He succeded best in the following manner: The chloride is dissolved in potass-lye; the solution is poured into a flask closed by a cork, with two perforations for the introduction and the escape of gas. A slow current of gaseous bromine is passed through the entrance tube above the liquid, which is gently heated. The bromine is readily absorbed, and the lead is gradually deposited as peroxide. The filtration is best effected by exhaustion through finely elutriated asbestos placed between two discs of asbestos paper.

A RAIN GAUGE.—A recent suggestion for the construction of a rain-gauge is that the copper body should be deeply corrugated so that the contained water may be permitted to freeze solid without incurring the risk of fracturing the vessel. It is thought that if the lower part of the rain-gauge were kept immersed in a freezing mixture with the object of solidifying the rain-water as collected, the risks of error due to irregularities in the rate of evaporation would be greatly reduced. For the purpose of measurement the ice would be thawed in a warm room, and the volume of the resulting water would be measured at the temperature of maximum density.

NEW AND CHOICE
PRACTICAL BOOKS
JUST READY.

BRANNT.—The Practical Scourer and Garment Dyer. Comprising Dry or Chemical Cleaning; the Art of Removing Stains; Fine Washing, Bleaching and Dyeing of Straw Hats, Gloves and Feathers of all kinds; Dyeing of Worn Clothes of all Fabrics, including Mixed Goods, by One Dip, and the Manufacture of Soaps and Fluids for Cleaning Purposes. Edited by William T. Brannt, Editor of "The Techno Chemical Receipt Book." Illustrated. 200 pages, 12mo. Price.....$2.00

LIEBER.—The Assayer's Guide; or, Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the Principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber. A new, revised and enlarged edition. Illustrated. 283 page 12mo. Price.....$1.50

DUNCAN.—The Practical Surveyor's Guide. Containing the necessary information to make any Person of common capacity a Finished Land Surveyor, without the Aid of a Teacher. By Andrew Duncan, C.E. New, revised and enlarged edition. Illustrated by 72 engravings. 214 pages, 12mo. Price.....$1.50

RECENTLY PUBLISHED.

DEITE.—A Practical Treatise on the Manufacture of Perfumery Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentrifices, Cosmetics, etc., etc.; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. Deite, assisted by L. Borchert, F. Elchbaum, E. Kugler, H. Toepffner, and other Experts. From the German by William T. Brannt, editor of "The Techno-Chemical Receipt Book." 28 engravings. 12mo, 358 pages. Price.....$3.00

LANGBEIN.—A Complete Treatise on the Electro Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. From the German of Dr. George Langbein. By William T. Brannt. 125 engravings. 8vo, 404 pages. Price.....$4.00

LARKIN.—The Practical Brass and Iron Founder's Guide. A Treatise on Brass Founding, Molding, the Metals and their Alloys, etc. By James Larkin. A new revised and greatly enlarged edition. Illustrated. 12mo, 400 pages. Price.....$2.50

LEHNER.—The Manufacture of Ink. Comprising the Raw Materials, and the Preparation of Writing, Copying and Hektograph Inks, Safety Inks, Ink Extracts and Powders, Colored Inks, Solid Inks, Lithographic Inks and Crayons, Printing Ink, Ink or Aniline Pencils, Marking Inks, Ink Specialties, Sympathetic Inks, Stamp and Stencil Inks, Wash Blue, etc., etc. From the German of Sigmund Lehner, Chemist and Manufacturer, by William T. Brannt. 12mo, 230 pages. Price.....$2.50

OSBORN.—The Prospector's Field Book and Guide to the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines and Mining." 44 engravings. 12mo, 175 pages. Price.....$1.50

WAHNSCHAFFE.—A Guide to the Scientific Examination of Soils. Comprising Select Methods of Mechanical and Chemical Analysis and Physical Investigation. From the German of Dr. Felix Wahnschaffe. With additions by William T. Brannt. 25 engravings. 12mo, 177 pages. Price.....$1.50

BRANNT-WAHL.—The Techno-Chemical Receipt Book. Containing several thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and Industries. Edited by William T. Brannt and W. H. Wahl, Ph.D. 78 engravings. 495 pages, 12mo. Price.....$2.00

BRANNT.—The Metal Worker's Handy Book of Receipts and Processes. 63 engravings. 538 pages. 12mo. Price.....$2.50

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing Rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers; Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for everyday use in the workshop. By Leroy J. Blinn, Master Mechanic. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. 296 pages, 12mo. Price.....$2.50

VAN CLEVE-EDWARDS.—The English and American Mechanic. An Every-Day Handbook for the Workshop and the Factory. Containing several thousand Receipts, Rules and Tables, indispensable to the Mechanic, the Artisan and the Manufacturer. By B. Frank Van Cleve and Emory Edwards, C.E. 85 engravings. 500 pages, 12mo. Price.....$2.00

EDWARDS.—000 Examination Questions and Answers for Engineers and Firemen (Land and Marine): Who desire to obtain a U. S. Government or State License. By Emory Edwards. Pocket book form, gilt edges. 123 pages. Price.....$1.50

EDWARDS.—The American Marine Engineer. Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards. Illustrated by 85 engravings. 440 pages. Price.....$3.50

Electricity.

Electrical Railways in Small Towns.

The stupendous growth of the modern street railway is nften pointed nut, so nften in fact that investors are beginning tn fear that tbe business nf organizing companies for the purpose of building electric railways is almost being overdone. Nothing can be more important, in deciding beforehand the desirability of a street railway in a certain town, than a knowledge of about what proportion of that population is likely to be regular patrons of the intended road and how many passengers are needed per annum to make the investment pay.

The commercial benefits that a new street railway bring to a growing town are so well known as not to need mention, and the practical aspect settles itself into tbe question as to how small a town would be profited by the building of a street railway. In treating this it is necessary to know just wbat part of the population is likely to ride daily. The following figures, which have been carefully prepared, will show what past experience has proved. The average of nine towns with a population ranging from 3500 to 18,000 shows that each person takes on an average 29 rides per annum. It bas been estimated by such able engineers as Mr. Crosby that, in order to pay five per cent on the investment, an electric car must earn an average of 15 cents per car-mile. At a fair rate of paying expenses tbis would require about three or four passengers per mile. With the low average of 110 miles per car per day about 400 passengers would tbus be needed to make the road pay. If a population of a certain town be 12,000, according to the above figures 348,000 fares would be collected per annum, and this would support no more than two cars regularly. By the same average, a population of 20,000 would support three cars in such a way as to earn five per cent on the capital invested; the calculation including cost of building and equipping a new power station. Nearly every town that would be included in the above list already has an electric lighting station, and almost always has two or three streets that would yield a heavy traffic; thus a plant already in operation would strike off from the expenses of the above estimate the cost of powerhouse and nearly all its effects, with the exception of generating equipments and possible increase in boiler and steam plant. There are in the United States more tban 250 towns with a population ranging from 8000 to 20,000, a very small fraction of which have a street railway installation. It is not to be wondered at, then, that the present electric lighting equipments are made use of by investers seeking a profitable return. We think the hue and cry that trolley roads are becoming overestimated would be less frequently heard if all of the advantages which street railways bring with them were also taken into account.—Street Railway Gazette.

The Electrical Habits of Iron.

It is strange how little is known about the loss of power in iron under reversals of magnetization. It has been known for many years that energy was lost when iron was magnetized and demagnetized, but, says London *Industries*, tbe builders of dynamos had no clear idea on the subject. Seven years ago Professor Ewing and Dr. Hopkinson called attention to the loss of energy by hysteresis, apart from Foucault currents; but since then no information of any practical importance has been added. It seems as if everything connected with alternating currents is doomed to go through a period of barren quasi-scientific treatment before being studied and utilized by electrical engineers. The quasi-scientific metbod of treating iron is to take curves with a ballistic galvanometer. This is a cumbrous method, and does not give the information required. The engineer really wants to know what kind of iron gives least loss by hysteresis, what maximum induction does it pay best to employ, and how much energy is wasted per cubic centimeter per cycle. To test a given sample the obvious way is to make a little choking coil of it, and to measure the power lost by a wattmeter. This gives the information at once as regards that sample. If readings are taken at different electromotive forces, the losses at different inductions are obtained. The ballistic galvanometer method is merely an indirect and perbaps inaccurate way of arriving at the same result. Finding the qualities of different samples is a very small matter. The cbief difficulty is to find good qualities of iron at reasonable prices, and what is wanted is the knowledge of the causes that go to make irnn and mild steel good or bad. Makers of iron do not generally know anything about hysteresis, and electricians knnw little abnut irnn, but it is nn use shirking the subject and reading papers tn scientific societies about curves belonging tn specimens nbtained at randnm from unknown sources. Reams nf paper have been covered with researches on curves of random samples, and they are absolutely useless. They may be nf scientific interest; if so, well and good, but they are generally supposed to be for the benefit of the benighted and ungrateful practical man. So far all the information the dynamo maker has is that soft iron has comparatively little loss by hysteresis, and he pins his faith on some particular merchant who supplies him with a metal which he calls "hest Swedish charcoal iron," but wbich is not generally labeled "Made in Sweden."

A few investigators have given the analyses of their samples; but we do not know whether the percentage of carbon is the salient quality, or whether the mioute traces of other substances increase or decrease the loss of power. Neither do we know how the treatment of the iron in rolling and annealing affects the magnetic properties. If investigators could only be induced to consider what practical people want to know, instead of what "looks deep in print," some useful information might be obtained.

Electricity in Mill Work.

We are now really entering upon the electric-power transmission era. Recent developments clearly show this. Electric-power for millwork has long been talked of, but its realization and adoption now seem to be at band. Its practicability and economy have before been demonstrated, but the drawback has been the cost of the apparatus. The advantage of subdividing the units of power in mill and factory by the use of electricity is a virtue of the system which will commend itself in place of steam, providing the first cost of apparatus is not too great. It is estimated it saves 30 per cent in power over the present steam methods, with its attending long lines of belting and shafting.

The high cost of the apparatns necessary for power purposes has been due more to oversight than necessity. Machines heretofore have not been made for this special work, but now, as an extensive and profitable field and one neglected in the past appears, special machinery of reasonable cost for this purpose is being made. We have it from an authoritative source that within 60 days the price of electric apparatus for power purposes will be materially reduced, and important developments may be expected to follow.

New England, as it rightly should, with its great mill and factory interests, is taking the lead just now in the adoption of electricity for power transmission. The Cataract Construction Company of Niagara Falls, of course, will be without exception the largest power-plant in the world, but it will supply current for all purposes. The Taftville equipment, wbich will be strictly a mill plant, will in all have a capacity of 750-hnrse power in generators, aod transmit power from waterfalls 3½ miles distant. This will operate a large part of the mill machinery. In locations where waterpower is cheap and relatively handy, it can, through the agency of electricity, be made to run machinery cheaper than by any other method.

We predict that in a few years all good waterpowers in New England and elsewhere that are now ruoning to waste will be harnessed by electricity to operate the wheels of industry. The fact, however, that electricity can be subdivided, and therefore do away with considerable shafting and belting, often recommends its use even where steam has to be used to operate the generators. This has been demonstrated in both Brockton and Lynn. In the latter place it is proposed to equip about 12 factories with electric-power throughout, the current to be furnished by tbe local central station.

Such plants will need but little attention, and with its numerous motors operating independent of each other, power can be used as wanted. The supply of power will be regular and reliable, a duplication of generators being in readiness at the station from which power is taken.—Boston Commercial Bulletin.

Electric Light and Gas.

Engineering, in a "note" oo this subject, remarks that the erection of numerous large electric central stations has naturally brought the respective merits of gas and electricity for lighting purposes to the fore, as well as the question of what effect the increased adoption of the latter is likely to have upon the consumption of the former. As a rule, hnwever, tbe consumption of gas is steadily increasing, nntwithstanding the mnre general adoption of electric light. In Stockholm, for instance, the increase in the consumptinn of gas in the year 1888, when 14,000 incandescent, and about 250 arc lamps were in use, amounted to mnre than 6½ per cen., a state of affairs which still exists, althnugh electric light has in tbe meantime become much more general. In Berlin, where the central statinn alone feeds some 100,000 lamps, in addition to numerous private installations, the increase in the consumption of gas has in late years been steady. During the financial year 1888–89, for instance, the private consumption of gas rose 7½ per cent, althougb the number of electric lamps was doubled during tbe same period, a fact which becomes still more remarkable when it is pointed out that the increase in the gas consumption was largest (about 10 per cent) in the central parts of town, which were nearest to the electric installations. Under tbese circumstances the corporation of Berlin decided to build a fifth gas works, calculated for a maximum production of not less than 12,400,000 cubic feet per day. At about the same time Hamburg expended $750,000 in the extension of one of its gas works, although at the same time an electric central station for 20,000 lamps was being built. In Leipsic the old gas works have been extended and the new ones doubled, simultaneously with the erection of several important electric installations. At Elberfeld, a maoufacturing town of a little more than 100,000 inhabitants, the consumption of gas is increasing, although there is a central electric station of 7000 lamps capacity. The same is the case at Muhlhausen. At Darmstadt, with only 50,000 inhabitants, the gas works are taxed to tbe utmost of their capacity; an electric central station for 4000 lamps was, therefore, built, but the gas works have since had to be extended. At Lubeck there was, to begin with, a decline in the consumption of gas after the central electric station of 2600 lamps had begun operations, but this did not continue for more than a year, and since then the consumption of gas has been steadily increasing. In Gothenburg electric light has been adopted to an unusual extent, and is constantly increasing, but still the consumption of gas becomes larger every year, and a new gas works has been built. Of course it is improbable that a continued increase of electric-lighting will also for the future be attended by a larger consumption of gas, yet there is no reason to anticipate any marked decadence as far as gas is concerned; for along with its original use for lighting purposes, gas is every day applied more and more to heating and industrial purposes.

NOTICE OF ASSESSMENT.

GOULD & CURRY SILVER MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 22d day of November 1892, an assessment (No. 70) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the TWENTY-EIGHTH DAY OF DECEMBER, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of January, 1893, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.
ALFRED K. DURBROW, Secretary.
Office—Room No 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

WE MANUFACTURE

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

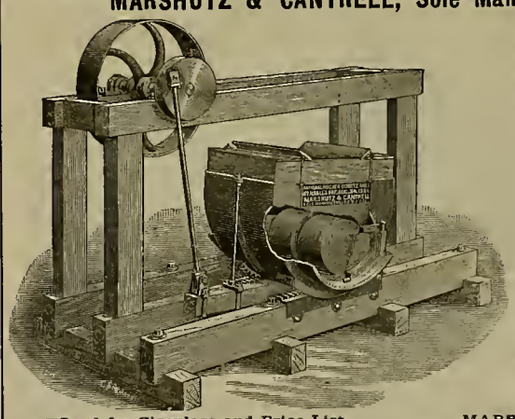
KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

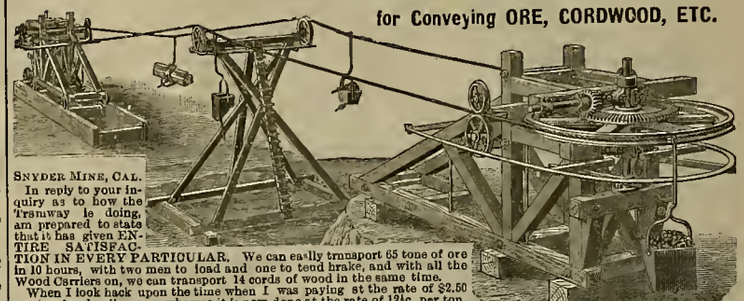
VULCAN WIRE ROPEWAY,

for Conveying ORE, CORDWOOD, ETC.



SNYDER MINE, CAL.

In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.

When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making **a saving of $150 per day**, and also, where it formerly cost me $3.50 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

Useful Information.

The Proper Method of Firing.

Mr. James Sargent, inventor of the automatic smoke-preventer, writes: The average steam boiler furnace wastes a large amount of coal by reason chiefly of improper firing, and while it is beyond the limits of a treatise of this character to give full directions covering every case, the following will, if followed, be of value to every user of soft coal.

In the first place, firing is hard work, and the tendency of the average fireman is to feed in too much coal at one time, the evident intention being to thereby increase the length of time between fresh fires. The outcome of this is, that for a short period after each application of fresh coal, what may be termed the natural smoke-consuming capacity of the furnace is overtaxed, with the result that a considerable portion of the distilled hydrocarbons is unconsumed, and hence passes off as smoke. Moreover, this loss of hydrocarbon is accompanied by that form of incomplete combustion which produces carbon oxide instead of carbonic acid, with a consequent great loss of heat.

The clear remedy is more frequent firing with smaller quantities of coal to each fire.

Again, even when the amount of coal added at each firing is not too great, the tendency frequently is to wait until the fire has so far burned out as to become lower than is compatible with the conditions for perfect combustion. In this case, the adding of fresh fuel results the same as before, namely, in the distillation of heavy hydrocarbons, which pass away as smoke.

In a few words, we may say, then, that more frequent firing, with smaller quantities of fuel, will lead to considerably better results than are gained by the usual method. Firing alone, however, even though carefully conducted, cannot be relied upon to prevent smoke emission, although when joined with the use of Sargent's automatic appliance, a practically smokeless combustion easily ensues. As further useful hints, we may say:

1. The fire should be evenly distributed over the entire surface of the grate, and not heaped up in front, with the grate nearly uncovered at the bridge-wall, as is sometimes the case. Leaving the grate uncovered at the rear end of the firebox permits the admission of cold air at a point where it can only do harm.

2. Large pieces of coal should be broken into small lumps, and in firing distributed evenly over the entire area of the fire, or better, over the front half of the firebox, and pushed back as combustion proceeds at the rear. In this way the rear half of the firebox is supplied only with coked fuel from which the constituents of smoke have always been fully driven off.

3. The opening of the furnace door admits too much cold air, hence, as a rule, firing must be done quickly, keeping the furnace door open as short a time as possible.

4. Ash-pits should be frequently cleaned, and the air-spaces between the gratebars kept free.

The only objection that can be urged against the foregoing brief hints is that they increase somewhat the labor of firing. A strict compliance with them will by itself decrease fuel consumption at least five per cent. Their rigid use in conjunction with the automatic smoke appliance will decrease fuel consumption for a given amount of work to be done from 10 to 15 per cent.

Music for the Phonograph.

All day long the sounds of music issue from the rear windows of the central house in the block on the east side of Fifth avenue, between Twenty-eighth and Twenty-ninth streets, says the New York *Sun*. These sounds are not such as come from the piano when the latter is under the spell of my lady's fingers, or from the guitar or violin or any other instrument that is appropriate to individual entertainment. They are of different kinds, both vocal and instrumental. Sometimes they emanate from a chorus, sometimes from two voices only, and sometimes from one. Brass bands and string orchestras contribute. The sounds are always very loud and can be heard for blocks around. Sometimes the music is accompanied by oratory. The people who occupy the houses on the same block, and also those in the houses which form the square to the eastward, can hear all plainly. The sounds affect these people variously. Some seem to be much annoyed and keep their windows closed most of the time. Others seem to enjoy it, and sit at open windows or even go out into the rear yards to hear more plainly. The servants seem to enjoy it particularly, and probably many a household duty is neglected while they stop to listen. If one were to enter the house whence the noises come, he would find that the music and oratory are all due to Mr. Edison's invention of the phonograph, and the sounds are intended to be recorded indelibly upon the little wax rolls contained in phonographic instruments. The popular songs, oratioos of great speakers, and all the other entertaining and instructive sounds which are duplicated on the phonograph, originate here. The company which puts the phonographs in the hotels and other public places throughout the country must constantly provide new rolls containing the latest instrumental music, songs and speeches, and, therefore, musicians and orators are kept busy every day introducing them into the machine.

Artificial Eyes.

The *Optician* says: The porcelain eye, by its truly wonderful likeness to the human eye in color, size and conformation, is a mark of the advance in opthalmological science. If the removal of eyes in olden time was done in a rude way, as by putting lime between the eyelids, or puncturing the ball with a nail, no less primitive in its way was the artificial reproduction of the eye. The first artificial eye consisted simply of a metal shell painted or enameled over, figuring the sclerotic and iris and leaving the cornea absent. It was not until the seventeenth century that a Dutchman made an artificial eye of enamel, and combining this with glass, succeeded in representing the cornea. However, the eyes were simple oval shells, like the half of a bird's egg, and could be worn in either orbit, there being no right or left. How different now! Not only have we rights and lefts, but the resemblance to the natural eye is so great that it often takes an expert to detect it; and how completely the public in general can be deceived by it is illustrated by an incidental case occurring in the practice of the late Dr. Williams, of Cincinnati. A sharp-witted Irishman who had his eye removed by the doctor did not wish to let his neighbors know that he was wearing an artificial eye, so when he returned home he told them the old one had been taken out, scraped and put back. Not only did he deceive his neighbors, but the county papers took it up and made so much noise that the good doctor became indignant and exposed the patient's story, whereupon the Irishman, when next seeing the doctor, said: "Doctor, you see what a good thing I was making for you, and you went and spoiled it all." And the belief, says Dr. A. E. Davis, of New York, to whom we are indebted for these details, that an eye can be taken out, scraped and put back again, is not confined to the grossly ignorant, as shown by one case reported in this paper; hence it may be well to disabuse their minds upon this point before the operation is done. Artificial eyes should be removed each night, washed and kept in a dry place, and not in a glass of water during the night, as is usually done. Two years is about the limit of time of service of an artificial eye, when it becomes rough and has to be renewed. However, another medical man reports one case where a woman, for fear she would not be able to replace the eye if removed, wore it continuously, without once removing it, for 15 years.

A. FISHER, superintendent of the Caribou Water Power & Electric Company, has discovered a method of transmitting signals and sounds, dispensing with batteries and depending simply on positive and negative electrical current forces in the earth. A line is in successful operation between the company's works at the dam and the stand pipe, 7000 feet distant. He also has a branch to his home. It has been successfully tested in all kinds of weathers. The looger line has more force. By placing a key on the line it can be used as telegraph or telephone. Fisher served an apprenticeship with the electrical company in San Francisco, was sent to the Sandwich Islands and experimented there for two years. He has lived in Caribou three and a half years. He has applied for a patent on the discovery.—Columbus Press.

AN electric bicycle lamp coming into use among English wheelmen is said to give a brilliant, intense and steady light. It is about two inches in diameter. The lamp is detachable and is connected to the battery by means of a cord with a plug at the end which fits into the terminals of the cells. A switch at the bottom of the lantern enables the rider to turn the light on and off when at full speed. The accumulator is contained in a leather bag firmly secured in place by straps.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Scientific Press Patent Agency.
ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street, - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the Trinmph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed] Sup't North Star and Original Emipre Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

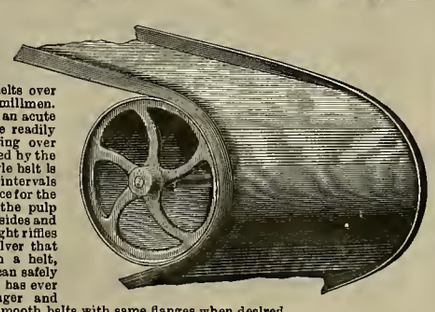
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

PIONEER DISTRICT.— Amador *Record*, Dec. 10: Charles Gracey is busy putting up two Frue concentrators at his Bryant mill. This will be a long-felt want supplied in this mining district, because hitherto only free-milling ore could be crushed to advantage. Milton Bierce reports having had to shut down temporarily the Modoc mine, awaiting machinery. F. Mace is busy hauling more machinery from Ione to the Irma Gold Mining Co. It is rumored here that Joe LeDuc has bonded his mine for $10,000 to some Stockton capitalists. Charles Stirnaman, manager of the Amador View mine, paid us a visit previous to his going to San Francisco on a business trip in the interest of his company. He reports that the mill is running full blast on $100 ore, under the superintendency of Sidney James, who has the reputation of being the most careful millman in this part of the county.

GOLD.—Amador *Ledger*, Dec. 10: Developments in the last few months in the Gover mine have opened out a large body of high-grade ore. This was found on their 800-foot level, or at a vertical depth of 800 feet. The vein is now 20 feet wide and improving as they enter into it. Although they have opened out a large reserve above their 800-foot level, the vein is richer and stronger going down, and the Gover Company intend immediately to sink for another level This development makes a bright future certain, and insures to its stockholders handsome returns for their investment. The superintendent's residence at the Kennedy is being pushed to completion as rapidly as possible, though great delay has been occasioned by the stormy weather of the last few weeks. The storm of last week worked a deal of injury to many of the water ditches, the result being that some of the enterprises of the county were without water for a time. The Kennedy ran its hoists with steam and had to shut the mill down for two days. For about a week the Zeile has been running only five stamps, while the mill has been undergoing repairs. The repairing is still in progress.

Modoc.

PROSPECTING WELL.—Adin *Argus*, Dec. 10: Dan Ambrose, who is working the Tunneling Company's mine at Hayden Hill, was in town last Saturday. He says they have the tunnel in 600 feet, and prospects are becoming flattering. All the mines being worked at the Hill are said to be prospecting fairly well.

Nevada.

WASHINGTON TOWNSHIP.—*Transcript*, Dec. 6: The mining outlook for this section is becoming brighter. Several ledges are being developed and more will be prospected and worked in the spring. The annual labor is now being done on the Miller ledge, located on Little Canyon creek, a short distance north of this place. J. R. Nickerson of Auburn is prospecting a ledge on the hillside about half a mile in a southerly direction from the Yuba mine, two men being employed. The ledge is from 8 to 12 feet in width, and some of the rock is quite rich in free gold, showing also plenty of galena and sulphurets. At the Blue Jay mine, M. A. Baugh superintendent, a contract has been recently let to drift 100 feet on the ledge each way from the bottom of the shaft, which is a hundred feet below the drain tunnel. The size of the ledge at that point is said to be from 2 to 5 feet in width and all high-grade milling ore, some of it being quite rich in free gold. The Yuba mine, owned by Messrs. Webber, Haggin and Tevis and the estate of George Hearst, deceased, all of San Francisco, has been indefinitely closed down and the pump removed from the shaft; still five or six men are yet employed by the company in extending the drain tunnel south in hopes of finding pay ore in that direction. Should their object be accomplished, the mill will be started up again. The Eagle Bird mine will in a few days close down for a short time in order to put up a new compressor, the old one being almost worn out. At the Washington mine, Alf. Tregidgo superintendent, four men are employed. Two are engaged in running a drift north from the bottom of the 400-foot level in hopes of finding a pay shoot in that direction, and the other men are doing the hoisting and keeping the mine free from water. This mine and mill have been closed down now considerably over a year. Just when the works will be started up again is of course a doubtful question. At the German mine, a short distance south of the Washington, but not adjoining properties, as has been stated, the lower tunnel is now in nearly 600 feet. M. D. Cooley is the superintendent. It is not known how wide the ledge is, as no crosscutting has been done at that point, but eight feet in width of the ledge on the foot-wall proves to be all good milling ore. It is what is generally called ribbon rock, and some of it shows gold very freely. In the upper tunnel, 227 feet almost directly above this point, the ledge is found to be about the same size in every respect, but better rock. At the present time only four men are employed in the mine. Two are engaged in extending the lower tunnel south and two are making an upraise to connect the two tunnels. When that is done, there will be ample ventilation in the mine for all working purposes, and there will be rock enough in sight to keep a 20-stamp mill running an indefinite period. A five or six-foot rotary crusher, called the Beauregard, has been erected by the company as an experiment. About 100 tons of quartz was put through. If the new crusher has not proven entirely satisfactory to the management, as it was feared it would not at the start, it has demonstrated one fact, that the rock is rich and will pay handsomely if put through a stamp-mill, with an experienced amalgamator in charge. Mr. Cooley has already purchased from the Allen foundry at Nevada City a new ten-stamp mill to take the place of the present one, and early in the spring, or sooner if the weather permits, it will be shipped to the mine and placed in position as soon thereafter as possible. This mine, as far as developed, is the most promising one in the Washington mining district.

San Diego.

A BIG GOLD MINE LEASED.—Virginia *Enterprise*, Dec. 11: The Good Hope, one of the greatest gold mines in southern California, has been bonded and leased by Denver mining men, the Waters Bros. and Wm. Weston. The mine has upward of $1,000,000 net profit in sight, and is said to have an unbroken chute of free-milling gold ore 2500 feet in length. Foreign capitalists are negotiating for the purchase of the Good Hope.

Shasta.

THE TEXAS CONSOLIDATED.—*Democrat*, Dec. 10: This mine in Old Diggins is developing right along, and the mine is run like clockwork. Mr. Hart is shipping four cars of very high-grade ore a month. The shipments average a profit of about $2000 a carload. The total output of the mine and mill is about $14,000 a month. The vein is larger and ore richer in the lower tunnels and winzes than in any other place in the mine. Mr. Hart, the superintendent, is sinking a new winze below tunnel No. 4. This winze is in an eight-foot breast of ore, and it is all high-grade ore. In No. 4 tunnel the pay chute is exposed for 500 linear feet and the end not in sight. The vertical depth of the end of this tunnel from the surface is 750 feet. Mr. Hart has broken ground on No. 5 tunnel. This tunnel will give another 100 feet of backs.

THE BULLYCHOOP PLANT.—Mr. R. G. Hart Sr. was in town Monday, having just come in from Bullychoop, and from him we obtained the following interesting items about that promising mining camp. Mr. Hart, who is superintendent of the property, has been hard at work for several months with a big force of men erecting a big reduction plant there; and had the late storm kept off for ten days, he would have had the plant completed and in fix to run this winter, but the storm blocked all the work and caused a temporary suspension of work on the plant. When he left there Saturday there was seven feet of snow on the ridge. He has erected a 20-stamp quartzmill to reduce low-grade ore, and a Dodge pulverizer to work heavy sulphurets. The Dodge mill will pulverize 60 tons of ore a day. The reduced ore from the Dodge pulverizer is conveyed into heavy steel and iron leaching-tanks, each tank having a capacity of ten tons. Cyanide process is used for leaching. The leaching-plant will handle ten tons a day. The 20-stamp mill has eight Trinmph concentrators attached, and four more will be added in the spring. The ore is conveyed to the plant, a distance of 1100 feet, by a gravitating double-track tramway conveying one-ton cars. The tramway will be roofed the entire distance to shield it from snow in winter months. It is the intention of the company to build a new mill in the near future on Jerusalem creek, one mile below the present mill, where they have waterpower sufficient to run a 100-ton plant all the year round. The tramway will be extended down the mountain to the new mill, and with this cheap power and economical way of handling the ore, the company will be able to make a profit out of $4 ore, of which there are thousands of tons on the surface on the mountain. Taking it all together, this is the largest milling plant in northern California. The company has erected quite a town on the mountain. There is a store building stocked with $4000 worth of miners' supplies, a blacksmith shop, a sawmill which has cut 207,000 feet of lumber, a large boarding-house that accommodates 50 men, an assay office with a complete laboratory, the superintendent's office and residence of seven rooms, three dwelling-houses occupied by families, six miners' cabins, a large barn, a housed water tank 12x12, besides the big mill. This one mine, when running a full force of men, will give employment to 100 men or more, and put in circulation considerable money yearly in the western part of the county.

CLOSED FOR THE WINTER.—Anderson Valley *News*, Dec. 10: The Hart mine at Bully Choop has closed down for the winter owing to the depth of snow, which is between four and five feet. T. H. Hart and son went to their Texas mine in Old Diggings district Sunday. This is a rich mine, paying the owners a handsome dividend.

Sonoma.

THE CHROME WORKS.—E. K. Stevenot, the enterprising projector of the contemplated chemical works in Sonoma, reports the local subscription list as creeping up slowly but surely. Already the people of Sonoma have subscribed liberally to the capital stock. As soon as town and valley have been closely canvassed and the requisite number of shares subscribed to give Sonoma a controlling interest in the works, the subscription list for the stock will be open to investors in San Francisco and other places until the required amount of money has been raised to start the works.

Trinity.

THE NEW RIVER MINES.—Humboldt *Standard*, Dec. 3: William Toms and George Dean arrived in Eureka this morning from New river. Mr. Toms has been sick for some time past, and comes to Eureka to spend the winter, where he can have better accommodations and medical attention. He is superintendent of the Ridgeway mine, owned by an English company. The mine has been closed down for some time past, and Mr. Toms states that he has no idea as to when work will be resumed. The mine is rich in gold and will some day, when worked pay handsome profits to its owners. Mr. Dean is in charge of the Ridgeway property at present. Mr. Toms says that the Sherwood mine, worked by Miller & Son and Thomas Nicholson, is the only mine on New river now being actively worked. Others are taking ore out of mines, but no ore is being crushed. The New river quartz is free gold-bearing with some sulphurets, but not sufficient at present to pay to save. Mr. Toms is paying considerable attention, while the Ridgeway mine is closed down, to his place on Trinity river, near the mine. He has 160 acres of mountain land adapted to fruit-growing, and he states that while he is waiting to take gold out of the earth, he will proceed to take golden fruit from the trees.

RICH GRAVEL STRIKE.—Shasta Co. *Democrat*, Dec. 10: Johnny McCall of Trinity Center is in town. He says the cement gravel channel discovered a month or so ago near Minersville is developing big pay. The gravel was found by inexperienced men, who drove a tunnel under some ground Chinamen had abandoned as worked out. The Chinamen had worked over the surface of this lead of auriferous gravel. Where the pay is the richest the gravel is a hard cement, but it carries what is termed by miners as "gourd seed gold," and will pay big worked in a mill or arrastre, or by any other device that will rapidly disintegrate the material. It is unquestionably a prehistoric river-channel deposit, and many miners believe the lead runs north and south through Trinity and Siskiyou and into southern Oregon.

Tuolumne.

TO COMMENCE.—Tuolumne *Independent*, Dec. 10: The Dead Horse mine, at Summersville, will commence active operations by the middle of next week. It has been idle for about two months for lack of water to run the machinery, and the shaft has filled up considerably in consequence. Since the pumps have been able to run, the mine is now about clear of water. The opening of this and other valuable mines in that vicinity will make times lively again.

THE MARTHA WASHINGTON.—Mr. Bennett, patentee of the Bennett amalgamator, who visited the Martha Washington mine, below Mountain Pass, to investigate the adaptability of his machine for working that class of gravel, was very much pleased with the situation in all its phases. He thinks they have a first-class layout for a mine, as good as he has seen in this or any other county. The first machine will be completed in from 30 to 60 days, and will be on the ground in early spring. They will have six of the machines, and each one will handle from 1500 to 2000 yards of gravel in 24 hours. Byron C. Hall is superintendent, and W. H. Purdie is engineer.

TO BE DEVELOPED.—Tuolumne *Independent*, Dec. 3: Messrs. J. B. Bacon, Chas. Bacon, and another gentleman of San Francisco, have taken hold of the old Joe. Hooker quartz mine, near Calder's ranch, and will proceed to develop it. The vein shows two feet in width on top, and they will sink 100 feet. If it pays as well below water level as it formerly did above, they have an exceedingly good outlook for a splendid mine. There is a five-stamp mill on the property, and the claim is in a section of old-time good mines. We wish these enterprising gentlemen all success.

MARBLE.—The Columbia Marble Mills have shipped five tons of marble to San Francisco recently. The slabs are to be used as pavements. The durability for this purpose is superior to any other marble. Thousands of tons would be in demand, where one ton is now, were there a railroad to tap this marble mountain.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Enterprise*, Dec. 10: Owing to the increase of gas coming from the 1500 and 1650-level old stopes on the west side of the ledge and south of the Con. Va. shaft, operations through the shaft, which is upcast or outlet for air, operations have been suspended for the past five days. The gas escapes from the stopes which were worked some years ago and are not accessible, as all the drifts and openings have partially closed from ground movement and heavy crushing. There is undoubtedly fire in some part of these old stopes, caused by friction from the ground crushing and breaking the timbers. All drifts and openings leading to points where the gas escapes on the 1650 level are being closed, leaving a small opening for the escape of gas up through the Con. Va. shaft. On the 1100 level work has been suspended. On the 1500 level have resumed work in the stopes, sending the ore through an upraise north from the shaft to the 1650 level, thence to the surface through the C. & C. shaft. There has been extracted from all parts of the mine during the week 883 1490-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $23.68 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $20.63 per ton per battery samples. Bullion shipped to the Carson Mint, assay value, $17,904.15.

OPHIR.—1465 level—The upraise started on the sill floor, on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, has been carried up 8 feet; total length, 30 feet, continuing in porphyry and quartz of very low assay value. Bullion shipped to the Carson Mint, assay value, $5 898.48.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 22 feet; total length, 373 feet; continuing in a porphyry formation with lines of low-grade quartz.

UTAH.—340 level—From the north drift from west crosscut No. 2, at a point 195 feet in from its mouth, west crosscut No. 3 has been started and advanced 6 feet.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, was advanced 20 feet; total distance west of shaft, 2708 feet; face in porphyry.

CHOLLAR.—The north drift from the east crosscut, 160 feet south of north line, 930 level, is out 37 feet; face in clay and porphyry.

POTOSI.—Extracted and sent to the mill the past week 430 tons. On hand at mill, 69 tons 1150 pounds. Average battery assays, $20.09. Average car sample assays, $21.03. Shipped to Carson Mint, 706 pounds of crude bullion.

BULLION—The north drift from west crosscut, 100 feet north of top of raise from 1300 level east crosscut, 320 feet south of north line, is out 60 feet; face in porphyry. The west crosscut, 390 feet south of north line from Ward shaft, 1800 level, is out 65 feet; face in quartz, clay and porphyry.

ALPHA.—The joint Alpha and Exchequer east crosscut on north line of Alpha is out 100 feet; face in porphyry.

WARD SHAFT.—Exchequer and Alpha joint east crosscut, on the south line of Exchequer, is out 100 feet; face in porphyry. The west crosscut, 300 feet south of Bullion north line, 1800 level, is out 55 feet; face in porphyry, clay and quartz.

NEW YORK.—The west crosscut, 55 feet north of the shaft, 800 level, is out 55 feet; face in clay and porphyry. Are extracting from the stope above the 650 level from 10 to 12 cars of ore per day, car samples assaying from $40 to $45 per ton. Commenced shipping ore to the Washoe mill on Thursday. The test run of 104 tons 1533 pounds of ore worked at the Washoe mill resulted as follows: Average car sample assays, $46; average battery assays, $39.20—producing bullion to the amount of $4,172.72.

SILVER HILL.—The north drift on the 160 level has been advanced 9 feet during the week through quartz giving low assays.

OCCIDENTAL.—Have extended the main north drift on 750 level 13 feet through low-grade ore. The upraise from south drift, 750 level, is up 22 feet; top in fair-grade ore. Crosscut No. 2 in Zadig drift, Sutro tunnel level, is in 46 feet; formation, porphyry and clay.

BEST & BELCHER.—200 level—During the past week the northwest drift has been extended 25 feet; total length, 67 feet; face in porphyry. On the 900 level we are still repairing.

GOULD & CURRY.—On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 12 feet during the past week; total length, 724 feet; face in very hard porphyry.

HALE & NORCROSS.—1800 level—Advanced No. 1 west crosscut 22 feet; total length, 214 feet; face in porphyry and stringers of quartz. West crosscut No. 3 was advanced 13 feet; total length, 153 feet; face in porphyry and stringers of quartz. During the week west crosscut No. 4 was started close to our north line and advanced 10 feet. The face of this crosscut is just cutting into quartz. Work in the face of main north drift on this level stopped; face in porphyry. West drift in the old or A-street workings advanced 21 feet and work stopped.

ANDES.—On 420 level north drift from end of east crosscut No. 1, north, advanced 6 feet; total length, 84 feet. Work in the face of this drift has been stopped. Have been making necessary repairs in north drift. To-day will start a north drift in the quartz from east drift No. 1, north.

Lynn District.

A BIG PLACER CLAIM.—Carson *Appeal*, Dec. 10: The district formerly known as the Buckeye, 20 miles south of Dayton, is now called the Lynn since it has been legally organized as a district. It is a big placer claim, and isble to cause considerable excitement in the spring. Yesterday, H. V. Benham sold a one-eighth interest in the Black Horse claim to Louis Stevenson of Reno for $300. A man who recently mined there took out over $300 in gold in two months.

ARIZONA.

STOCKTON HILL.—Kingman *Miner*, Dec. 10: George Aitken's scheme to tunnel under the mines of Stockton Hill is a good one, and would become one of the best-paying investments that could be made in Mohava county. The mines there are rich and fill the mountain in perfect network. The projected tunnel would tap all the veins at a depth of 800 to 1300 feet below the surface. The water obtained from the tunnel alone would pay back in a few years the first cost of the tunnel, while the royalties obtained from working the mines would be immense. Peter Caffrey came in from the Alpha mine yesterday and went out again this morning accompanied by R. T. Root and James Daley of Denver. Mr. Caffrey has, in the Alpha, the best mine in Arizona. It is an immense big vein and has big chutes of ore in many places. The mines on Sherum's Peak are being opened up in good shape. Tunnels are being run in and connections made with the levels above. The White Hills Co. will have a carload of mules here shortly, to be used in working their mines until their hoists can be put in place. The new manager of the White Hills mines, E. B. Kirby, is a mining engineer of experience, and will place the mines in splendid working condition in a short time.

IDAHO.

THE GEM MINE SOLD.—Wood River *Times*, Dec. 10: The Gem mine at Gem, Idaho, is practically sold. The price paid is $1,000,000, and the sale was effected on the examination and report of Mr. J. M. Burke. The purchasers are Irish landlords, who are seeking investments in reliable, well-developed mining property. For three years past the Gem mine has been one of the heaviest producers and best payers in the Coeur d'Alenes. The property is well worth the price asked and will quickly re-

place the outlay if worked on the present basis. Thns, one after another, the Cœnr d'Alene mines are changing bands at large figures, realizing to their discoverers, or tha people who have not feared to put their money in to develop them, handsome profits above a yearly income from the investment while tha money was tied up. In this case the owners have more than realized on their investment from the ontput of the property, and the sale now pending will be a clean profit. Men who bave made their money in mines ara not slow to reinvest it, which in this casa, if invested as before, would mean the purchase and davelopment ol at least half a dozen equally as expensive properlies.

THE DIAMONN FIELNS.—Special to *Examiner*, Dec. 13: After a search of two days' duration, yonr correspondent returned to Boise to-night from Owyhee county, where ha had gona to inspect the diamond fields discovered by Rnss Walters. It cannot be now doubted that diamonds have really been nnearthed somewhere along the Snake river, bnt the fields are not where Walters said they were. It was in Diamond basin, between Sinker and Rabbit creeks, that Governor Lyon, in 1865, found the stones that created such widespread excitement, aud Walters claims that his discovery was made in the same locality. This is false, however, as no location of any kind has been made in the Lyon country. The old prospect holes dug in 1865 are still visible, but no traces of other or later operation can be found. It is evident that Walters has misled every one through fear tbat he might lose his prize before he had fairly won it. He left Boise for the diamond fields last night. He was followed as far as Mountain Home, but at that place all trace of him was lost. Out of tbe hundred or more men who have gone out to locate claims not one has fonnd the diamond land. Your correspondent yesterday ran across 50 or 60 disappointed prospectors who were by twos and threes returning disconsolately from Diamond basin. They had carefully inspected tha surrounding country and said they were unable to discover any trace of Walters' bonanza, and could not learn that any strangers bad recently visited that region. Charles Van Dorne to-night admitted that the diamonds wbich Tiffany had pronounced valuable were not found near Diamond basin, but he refused to betray the location of the fields. He exhibited a message from expert Wieland, who ia now in the diggings, advising him to say nothing to reporters nntil Wieland reached Boise. W. A. Doty, of Boise, haa examined the diamonds found by Walters, and he says they are certainly genuine and of considerable value. At least 200 men are at tbe present moment eagerly seeking tbe diggings, many persons having gone to Mountain Home in the hope of striking Walters' trail. The excitement continues in Boisa, Nampa and along the Snake river, many placer miners having deserted their claims above Walters' Ferry to engage in a hunt for the precious stoues.

MONTANA.

THE PURITAN.—Philipsburg *Mail*, Dec. 10: All operations at tha Puritan mine and mill are going ahead now with results much more satisfactory than at any time since tbe mill was started np. During the recent shut-down of the mill for repairs, some needed improvements were made, with the result that it is now giving abont entire satisfaction, and the output bas already begun to increase. The hullion now being prodnced is much finer than at any time up to the time the late repairs were made. At the mina the same prosperons condition that bas beretofore been reported continues, and tbe great ore-bodies are showing more permanency and greater wealth with each day's development. Some gentlemen from the East, who are largely interested in Montana mines, were shown through the Pnritan tbis week, and after seeing it they exclaimed that it is tbe biggest thing tbey bave ever seen with a similar amount of davelopmeut. Jndging from the manner iu which the company ara going abead, they also realize the value of the mine, and from all present indications they will soon rank among the biggest prodncers of silver in the State.

UTAH.

THE GOLD PLACERS.—Special to *Examiner*, Dec. 13: The recent find of gold on the San Juan river in southern Utah, 40 miles north of the Arizona boundary, bids fair to rival any previous excitement on the continent since the days of '49. Sufficient teams cannot at present be secured to transport men and snpplies to tbe camp. From The Needles, Cal., to Gallnp, N. M., every town has been depleted of all the available outfits, wbich were used to convey goldseekers to tbe new find. Railroad men, from conductors to brakemen, have given up their positions and flocked in great numbers to the Gable district, as the new field is called. At least 1000 men are now on the grounds or pusbing across the desert as fast as teams can carry them. Winslow is almost depopulated, while Flagstaff, Williams, Kingman and Holbrook each contributed a fair share of ablebodied men. But two parties bave as yet returned, and these are refitting for their return. Tha wily original locators have staked off 147 claims and transferred 51 per cent of each claim to the Gable Mining Company. Many of the locators, who by this transfer become stockholders in the Gable Mining Company, are men holding high positions, and it is reported that not only the name of Oakes Murphy, Governor of Arizona, embellishes a location stake, but that tha name of Benjamin Harrison, too, appears on record as having transferred 51 per cent of his 20-acre location to the Gabla Company. French, a Mormon post-trader, has formed a syndicate and located 49 claims, and is preparing to do extensive work. The rocker and alnice-box seems at present the most practical method of working the claims, bnt it is said tbat in the lower conrse of the river, which is from 50 to 200 yards wide, it will require much capital to work to advantage; consequently it becomes necessary to consolidate interests. Reports vary as to the value of the dirt, but all seem to agree that it is very rich. In the meantime men are pouring in from California, Arizona, New Mexico and Utah at a rapid rate. The claims alresdy located lie in a deep canyon, soma say 2500 feet below the general surface of the country, and there is at present but one trail by which goods are packed down to tbe camp. It costs ten cents a pound to get freight hauled in, and about $35 for the privilege of riding on a lumber wagon, with the condition attacbed of walking over sand and up hills. The greater the expense, however, tha more anxions men are to go, and many walk all the way and psy $20 to bava their bedding hanled throngh. Tbe road to Blue Canyon is good, bnt the remainder abonnds in difficnlties. Everything is in preparation, and the Gable Mining Company propose spending a qnarter of a million in preliminary work before actual work in the diggings is begun. It is said the company have such confidence that they will spend two millions if necessary to place proper machinery, dams, etc., for working on a scale commensnrate with the extent and value of tbeir claims.

NEW GOLN FIELNS.—Coconino *Sun*, Dec. 5: Reports hava been rife here during the past two weeks of tba discovery of wonderfully rich placer fields on the lower San Juan river. Like all new discoveries, there is an air of mysterious secrecy about it which prevents an outsider from obtaining a true report of the discovery. That there is gold in tbe San Juan river has long been known to prospectors, but whether it exists in the quantity reported by tba parties interested in tbe claims remains yet to be proven. Tha discovery, as told to a *Sun* reporter, was mada some six months ago, and was mada by John Williams, an Indian trader living near the San Juan river. He communicated his find to other partiea and they shortly afterward commenced to work the claims, which proved to be very rich. Three months ago parties located some 200 placer claims. This attracted the attention of a few outsiders and the discovery could not longer be kept quiet. Dnring the past month prospectors have been going to tbe new find and there are now between 150 and 200 men in the fields, and they are jnst beginning to go. Last week several loads of lumber and provisions left this placa for tbe supposed new El Dorado, and from Winslow lnmber and supplies have been going for two weeks past, and at least 50 people have left that place during the past week and as many more will leave this week. Flagstaff has canght the contagion and will tbis week add to the number 50 searchers for gold. The placers are said to extend from tha mouth of the San Juan, up tbe river for a distance of 50 miles; at least locations have been made within that distance, and the claim is made that all are rich. The discovery can be reached from this point by private conveyance, and the distance is about 175 miles; the route is from tbis place to Tuba City, 110 miles; thenca to San Juan, 65 miles. There is water along the route and also good camping places, and the route crosses one corner of the Navsjo reservation. The diggings are abont the same distance from Winslow, and tha route leads directly across the Navsjo reservation, and after leaving the Little Colorado river water is scarce, and the Navajos will not permit white men to cross tbe reservation without an Indian guide. Private conveyance can be had at either Winslow or Flagstaff to the diggings. A surveyor is now at the placers and claims are being surveyed, and it is highly probable that a rush will be made to theae new gold fields.

OREGON.

A FIRST-CLASS QUARTZ MILL.—Ashland *Tidings*, Dec. 5: Probably the snuggest, tightest, best eqnipped and smootbest running quartz mill of its size in practical operation on the Pacific coast at this time is that of the Ashland Mining Company at the Helman street crossing of the S. P. Railroad in this place. The machinery was purchased of tha Joshna Handy Machine Works, San Francisco, and was pnt np by M. J. Sweeny, who was sent by the company for that purpose and who is now running the mill, in connection with Chas. J. Allmen, the assayer of tbe Ashland Mining Co. Tbe mill comprises at present one battery of five stamps, a Challenge ore feeder, a Hercules rock crusher and a Triumph concentrator. Tbe power is furnished by water from Ashland creek applied npon the turbine wheel formerly used by the planing mill. The capacity of the mill is from 10 to 15 tons ol rock in 24 hours, and this may be doubled, of course, by the addition of another five-stamp battery, which may be pnt in at any time at very slight additional expense besides cost of battery alone. The mill has heen pnt up in the most solid and substantial mannar, nnder the direction of Supt. J. A. Wilson of the mining company. Hauling ore from the mine to the mill, four teams are steadily employed, carrying abont 15 tons a day. About 100 tons are on hand under cover in the mill as a reserve run when hauling shall be interrupted by bad roads. Work at the mina continues upon the line of development mapped out by Supt. Wilson.

WASHINGTON.

MONTE CRISTO.—*Northwest Mining Review*, Dec. 1: The completion of the Monte Cristo railroad is being watched with interest by every miner in western Washington. The Monte Cristo district contains an immense body of low-grade ore that can be worked profitably when tbe road is completed. This ore will go to Everett for smelting, a large smelter being erected at the "City of Smokestacks" for this purpose. The men behind the railroad, smelter and mines are abundantly able to carry the scbeme throngh, and every one believes they have a veritable bonanza.

SMELTER.—Tacoma possesses tha only smelter in the Pacific Northwest that is running steadily. Heretofore it has been compelled to go into neighboring States for ore, but now it is redncing a large amount of ora from Washington. Within the next two years the Colvilla and Okanogan districts will be traversed by railways, and when the thonsands of now dormant mines and prospects will be in shape to tnrn out tbeir precious products, other smelters will be built, and Washington will rank with tbe best of S ates in the mineral-producing line.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Dec. 15, 1892.

Trade partakes of the usual holiday character, peculiar to the midwinter season. There does not appear to he any general disposition to push business pending stock-taking and annual settlements. While tbere does not appear to be any disposition to press trade, yet there is a feeling of confidence that after the turn of the year, or toward the spring months, there will be more activity in all branches. In this activity, it is said that the iron trade will be large sharers. Of course, this is largely dependent on the success that will he met with in securing lower local freights. The low freights hy clipper from the East have made it possible for our foundrymen and ironworkers in general to turn out work cheaper and more satisfactorily than ever before. Eastern mail advices report trade quite active for the season of the year, with the outlook more promising for general business than has obtained for years.

The local money market is reported easy, although collections on last regular collection day were smaller than for years. The small collections, taken in consideration with easy money and labor well employed, are a source of surprise and give rise to queries as to what becomes of the money earned. The banks continue to confirm reports of very little commercial paper offering. The small supply of commercial paper is said to he due to merchants carrying less goods in stock, and also to closer collections. After the holidays, heavy disbursements will he made to meet accrued interests, dividends and annual settlements. With the large sums that these call for afloat, we can reasonably look for investors seeking new business, particularly if the silver problem should he in a fair way of being adjusted on a plane acceptable to all countries in interest. Eastern mail advices report that while the money market was easier, yet the unsettled feeling regarding silver and the uncertainty regarding the probable action of the Monetary Conference were important factors in keeping banks and capitalists from entering on much new business. Doubtless the convening of Congress, with fears regarding financial legislation, had its influence also.

The proceedings of the Monetary Conference the past week appear to have been more favorable toward bimetallism, and that while no actual beneficial action can be looked for now, yet the groundwork has been laid which may lead to bimetallism before many months pass. Private advices state that the speech of Senator Jones on the question was the master effort of his life, and that it will have a telling effect in favor of himetallism. It can no longer he doubted that the calling of an International Monetary Conference, to discuss and, if possible, report favorably on bimetallism was a happy conception and that the discussion of the vexed question may eventually lead up to the adoption, by international treaties or agreement, of a plan which will bring about the long-desired double standard. A proposition was made the past week, hy one of the delegates from France, favoring the issuing of warrants hy each country against deposited silver. This plan, it is said, is acceptable to the Latin Union. Unless there is more to the proposed plan than telegraphed, it will hardly meet the approval of countries desirous of a stable currency and a larger money circulation. The issuing of warrants would make silver a greater gamble than ever, unless, as we said before, there is some provision not telegraphed which would lead to its prevention. At this writing, it looks as if the conference will soon adjourn over to meet in next spring. This, probably, would be done so as to familarize the delegates from each country with the changing opinions of their countrymen. It is asserted that bimetallism is getting very strong in both England and Germany, which, if the case, may change for the better the entire complexion of the situation.

SILVER—The steamship which left to-day for China took out some hullion. The shipments were not heavy, owing to dealers fearing to operate in the metal. The market, the past week, both at home and abroad, has hung heavily, with only slight fluctuations reported. It looks very much as if operators were in the dark and feared to operate largely either on the bull or bear side. Congressional action on the silver problem is closely watched, for there is a prevailing opinion that strong efforts will be made at this session to repeal the Sherman Act and pass a bill more favorable to silver.

QUICKSILVER—Receipts the past week aggregate 522 flasks. The market has held steady at current quotations.

BORAX—The market is reported firm in sympathy with the East,

ANTIMONY—The market is easy, with concessions obtainable. New York market is reported as follows by mail: 10¾c for Hallett's, 10¾c@11c for LX, 11@11¼c for Crown and 11½c for Cookson's in round lots.

LIME—Receipts the past week aggregate 4616 bbls. The market is steady at current quotations.

PIG LEAD—The market, while easier, is not quoted lower. The demand is slow. Eastern advices report a weak market, with producers offering freely with consumers offish.

TIN—There is very little business doing in both pig and plate. Spot parcels are hard to place, but for parcels for future delivery buyers can be found. Eastern and foreign advices are unfavorable for pig. Stocks, at last dates received, were accumulating. English cables report larger stocks of plate. There was exported from England for the United States 20,000 boxes in last month.

PIG IRON—Supplies have heen in excess of demand, and selling pressure for spot or to arrive is said to he met hy lower bids. Eastern advices report foundry and forge pig steady in all leading markets. *Iron Age* says that the East is looking forward to book a good deal of business before the close of the year. The Cramps are reported to be in the market for 20,000 tons of plates. A battleship and a cruiser are to he given out at Washington, which would call for about 3000 tons of hull plates, 600 tons of boiler plate, a round quantity of deck plates and of armor and some shapes. In New York the elevated and bridgework of the Harlem road will come up, and there are also some contracts for buildings.

COPPER—The market has held steady but firm. The stock in this country is being reduced, while the supply in Europe is the smallest on record since 1888. The favorable statistical position of the metal ought to exert itself soon, but probably fears of increased production, in the event of a bull campaign, may keep speculators out of the market.

COAL—Imports the past week aggregate as follows: Coos Bay, 750 tons; Japan, 3530; Tacoma, 2400; Departure Bay, 8405; Seattle, 1435; Nanaimo, 3400, Newcastle, N. S. W., 3556; total, 23,476 tons. The market for spot is firmer, with a slight advance for Coos Bay. Owing to the lateness of the season, household coals, it is said, will not he advanced, but foreign steam may go higher, owing to firmer prices for forward shipments.

Mining Share Market.

SAN FRANCISCO, Dec. 15, 1892.

The action of the market the past week confirms those who have made it a close study for years, that it is under strong manipulation and that it is no novice doing the work. The running of Potosi and Bullion up while shading other shares off, with a final closing by a sharp break, created confusion in the ranks of outside dealers. While chronic outside traders were more or less demoralized, the movements inspired confidence with old-time dealers that better times may possibly he counted on in 1893. While believing in much better times, yet they are not disposed to take a hand at the game while the market is under manipulation, for experience has taught tnem that it is unsafe and far too risky, for, like a two-edged sword, it cuts both ways. Besides this, it is a well-established fact that often the inside, failing to accomplish their object, have withdrawn, and those who were tempted into dealing came out hurt, if not ruined financially. While saying this, it must not he supposed that manipulation is based on the condition of the mines, but purely and simply on street points and twenty-dollar pieces, both of which are deadly financial poisons, not only to the unsophisticated but also to those who had heaten the game. The manipulators' resources are unlimited and can he drawn on daily without depleting the supply for either breaking the market or for sending it up. The mines, machinery, mills, miners and millmen can be and are used by them. It is not saying too much when we affirm that the manipulators can have, if the end just fits, a small or big fire in any mine or mill. They can also have a break in some of the machinery at a mill or in a mine, which, in consequence, would cause work to be suspended. There are hundreds of ways of sending prices down besides that of reporting water, clay, quartz of no value, porphyry, etc. The above can be, and it is said are used to depress the market, get in shares, and also to give excuses for levying assessments. But, on the other hand, when the inside has too many shares on hand on which they are not overanxious to pay assessments, then there are big things near at hand, for they are going to uncover one of those hidden bonanzas. This was successfully used years ago by Levy, Borland and one or two more when making a deal in one or more of the middle mines. Miners play an important part in this game hy giving out "strictly private" information of a strike of rich ore, and similar advices calculated to tempt the cupidity of suckers.

The MINING AND SCIENTIFIC PRESS, over three years ago, contended that there was a west lode, known to many as the Red lode, and that it was gold and not silver bearing. Our contention, which at that time was denied, is now fully verified, but the public must not run away with the idea that the lode will prove a big bonanza, for so far, when it has been run into by work to the west, it is narrow; that is, narrow for the Comstock, and while the ore in parts of it assays high, yet when it is milled, it will not average high. Then there is another serious point which must not be lost sight of, viz.: that after the lode is struck it takes time to get it into working condition. Upraises, winzes, drifts and crosscuts have to be run, all taking time and calling for money. After opening up one level, in far too many cases, it will be found necessary to start work on a still lower level to strike the lode in its downward continuation, by which a large saving can be made. It is well enough for operators to keep the above in mind, and not run away with the

idea that a strike is to be followed soon by ore-extracting, milling and dividends. It is this impression that has swamped the many who have dealt on information from the mines, without considering the same from a business point of view.

The bottled-up gas in Con-Virginia was brought into play the past week and asphyxiated about every dealer in Comstock shares. After the havoc, that very truthful man, Mr. Lyman, superintendent of the mine, commenced work to rebottle the compound, which he has succeeded in doing. Of course, it is to be brought into service again at some future time, if R. F. Morrow does not surreptitiously get it for use as a motor power for pumping out the Gold Hill mines. But, on second thought, perhaps this would be poor policy, for it would seem that it would be better to stop pumping out the Gold Hill mines and let them fill up, so as to complete the demoralization in the share market. It is a great game this of working the Comstock mines.

The market opened this (Thursday) morning fairly active at slightly firmer prices. An assessment on Con. Virginia, Yellow Jacket, Challenge and two or three others, with an assessment pending on Ophir and Crown Point, followed in January or February by assessments on Seg. Belcher and Belcher, cause the market to wear anything but an attractive appearance to outsiders; and when this is the case, insiders operate to get all the shares they can.

From the Bodie district our advices are confirmatory that the electric plant will be in operation before spring, and that there is no doubt of its revolutionizing mining in that district. This probably accounts for the steady buying of shares in that district under the most adverse circumstances, and to make the buying more successful, the shares have been unduly depressed.

From the Comstock mines our advices are quite encouraging. In the Union-Sierra Nevada west cross drift, on the 900-foot level, the reported strike is confirmed and that it may prove to be more important than had been looked for. In Mexican they are working in interesting ground. In Con. Virginia on the 1600-foot level, in the northwest drift, an important strike has been made, which, when developed, may again give that old reliable proposition a new lease of life. On the 1800-foot level in Hale & Norcross they are developing the ore reported by Senator Fair at the time he was superintendent of that mine about 18 years ago. Some of the reports current say that it is proving to be important and may be quite valuable. Belcher has stopped shipping ore to the mill, owing to the mill running on Yellow Jacket ore. The milling of ore by Yellow Jacket probably accounts for the 30-cent assessment. Advices from the other mines are of the usual tenor that has been reported for weeks past.

At the 2:30 session the Comstocks developed more strength under an improved demand and higher bids for Belcher. After regular Call, Belcher was advanced to $2 a share, but toward the close it was weaker. It is said that there is an improvement in the mine; probably this is to offset the unfavorable effect that might follow when it is known that the mill has been turned over to Yellow Jacket, yet the move may be genuine.

Eastern Metal Markets.

NEW YORK, Dec. 15.—The following are the closing prices the past week :

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	38½	82½	12 20	3 75	19 50
Friday	38½	82½	12 20	3 75	19 90
Saturday	38⅜	83½	12 20	3 75	19 90
Monday	38¼	83¼	12 25	3 75	19 95
Tuesday	38¼	83	12 25	3 75	19 55
Wednesday	38½	82½	12 25	3 75	19 50

Borax is firm under an enlarged demand. Quicksilver is steady. Pig iron is unchanged. Lead is weak, as is pig tin. Copper is fairly firm.

THE ELECTRO METALLURGY OF ZINC.—In order to prevent zinc from being deposited in a spongy state with the occlusion of hydrogen, Messrs. Siemens & Halske have added to the electrolyte a substance capable of combining with the hydrogen as fast as it is produced. This substance should be a weak solution of chlorine, bromine, or iodine, or hypochloric or hypobromic acid, or even an organic compound of chlorine such as hydrochlorine of glycerin, or glycol. The quantity added should be very small, and the deposit will be found to be quite solid.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 6, 1892.

487 467.—FILTERING SYSTEM - R. Beyerle, Los Angeles, Cal.

487 694.—CAR COUPLING—T. B. Brower, Templeton, Cal.

487,249 —VALVE GEAR—S. Chaplin, Buckley, Wash.

487 555.—TRACK BRAKE—H. E Dikeman, Berkeley, Cal.

487,557.—LOGGING ROADWAY—David Evans, Eureka, Cal.

487,261.—ORE CONCENTRATOR—A. Fraser, S. F.

487,523.—ORE CONCENTRATOR—A. Gonzalez, S. F.

487,571.—CAN-LACQUERING MACHINE—R. D. Hume, Gold Beach, Or.

487,572.—ORE CAR—F. A. Huntington, S F.

487,627.—LAST—A. M. Leighton, Port Townsend, Wash.

487,370.—ICE-CREAM FREEZER—H. Mayers, S. F.

487,578.—PLOW—F. S. Moore, Hanford, Cal.

487,409.—VENDING MACHINE—Robt. Moran, Seattle, Wash.

487,295.—CAMERA TAIPON—J. Rodes, San Diego, Cal.

487,585.—COVERING FOR BUILDINGS—M. P. Schetzel, S. F.

487,430.—BED BOTTOM—W. H. Scott, S. F.

487,336.—GATE—C. J. Simeral, Macleay, Or.

487,434.—PIPE COUPLING—E. T. Steen, S. F.

487,589.—ROUTING MACHINE—M. A. Taylor, Oakland, Cal.

487,340.—RAIL JOINT—Geo. Weeks, Oakland, Cal.

The following brief list by telegraph, for Dec. 13, will appear more complete on receipt of mail advices:

San Francisco—Henry C. Finkler, roller brake; George Harvy, snatch block; Charles C. Haub and J. F. Dasha, car-coupling; James W. Kinman, swinging crane; Bartlett McIntire, clip for wire-ropeways; William E. Walsh, means for transmitting power.

California—James Birch, North Ontario, cultivator; Christian Koenig, Stockton, tricycle; James Lamb, San Jose, horseshoeing apparatus; Willis H. Ostrander, Merced, repeating breech-loading gun.

Washington—Robert W. Murphy, Seattle, ink-roller for printing press; Ulysses H Rush, Tacoma, photographic printing apparatus and process.

Arizona—George W. Narton, Yuma, automatic water-gate.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. In the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LOGGING ROADWAY.—David Evans, Eureka, Humboldt county, Cal. No. 487,557. Dated Dec. 6, 1892. The invention relates to a roadway for effecting the transportation of logs from the woods to the mill or log-landings or to other suitable points. It contemplates the employment of a traveling cable, driven by suitable winding drums, said cable being directed through any suitable course required beside a similarly directed foundation or roadbed upon which the logs rest and over which they are dragged by connections with the traveling cable. In the lumber regions, especially those of California, the courses over which it is practicable to lay the road are devious, having many and sharp curves. The object of the invention is to provide such a construction of a logging roadway employing a traveling cable as will provide for the proper and effective turning of the log or any train of logs about the curves. To this end the invention consists of a roadbed or foundation, either plane-surfaced or ordinary dirt or formed of skids, this roadbed or foundation at the curves having a lateral slope away and downwardly from the inner arc of the curve and toward the outer arc thereof, and in connection with this roadbed a moving or traveling cable properly connected with the log or with the log-train, and fixed receiving and guide sheaves in the line of the inner arc of the curve in position to receive the cable after the log-train has passed. In this roadway the inventor accomplishes the free passage of the log-train around the curve, notwithstanding its attachment to the moving cable, by reason of the outward slope of the roadbed, which permits the train to pass around and at the same time provides for the proper guidance and removal of the rope from its sheaves at the time the train is passing and its return to said sheaves after it has passed.

CAN LACQUERING MACHINE.—Robert D. Hume, Gold Beach, Oregon. No 487,571. Dated Dec. 6, 1892. This patent covers certain details of construction in a machine which is adapted to apply lacquer to the exterior surfaces of cans containing hermetically-sealed goods, the lacquer being applied after the cans are filled and sealed for the purpose of giving a finish to them.

COVERING FOR BUILDINGS.—M P. Schetzel, San Francisco. No. 487,585. Dated Dec. 6, 1892. This outside covering for buildings consists in a peculiar construction of the main supports or rafters, with intermediate diagonal supports extending between the main ones, and in novel covering plates which are fitted to these supports.

TRACK-BRAKE.—Henry F. Dikeman, Berkeley No. 487,555. Dated Dec. 6, 1892. This improved brake for railway cars consists of peculiarly arranged shoes attached to a vertically-moving brake-beam mechanism, by which said beam is actuated to produce a vertical movement from the horizontal movement of the power-rod and in certain details of construction.

ROUTING MACHINE.—Melvin A. Taylor, Oakland, assignor of one-half to George M. Blair. No. 487,589. Dated Dec. 6, 1892. This invention relates to certain improvements in what are known as routing-machines. The improvements are especially adapted for routing the channels in the side rails of stairs, and the invention consists in certain details of construction.

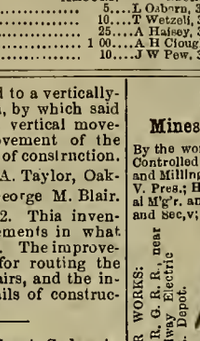
NEW DISCOVERY

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Cold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. CEO. GOW, Technical Mg'r, and ASS't Treas.; T. L. WISWALL, Gen'l Mg'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: On the D. & R. G. R. R., near the Broadway Electric R. R. Depot.



GLASGOW WORKS The Cassel Gold Extraction Co., Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:

Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co, Colo.; The Puzzler Gold Mining and Milling Co., Boulder Co, Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co, Cal; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fulfield, Utah; Champie's Mines, Hurubug District, Yavapai County, Ariz.; The Crowned Kinr and Last Chance Mine, Vavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Miuing Co., Revenue via Norris, Mont; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tube especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls

The total cost, as a rule, does not exceed from $2.50 to $5 00 per ton.

The most desirable class of ores for this process is the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any loquiries and furnish any desired information. Address,

T. L. WISWALL,
P. O. Box 926. Gen. Mgr and Secretary.

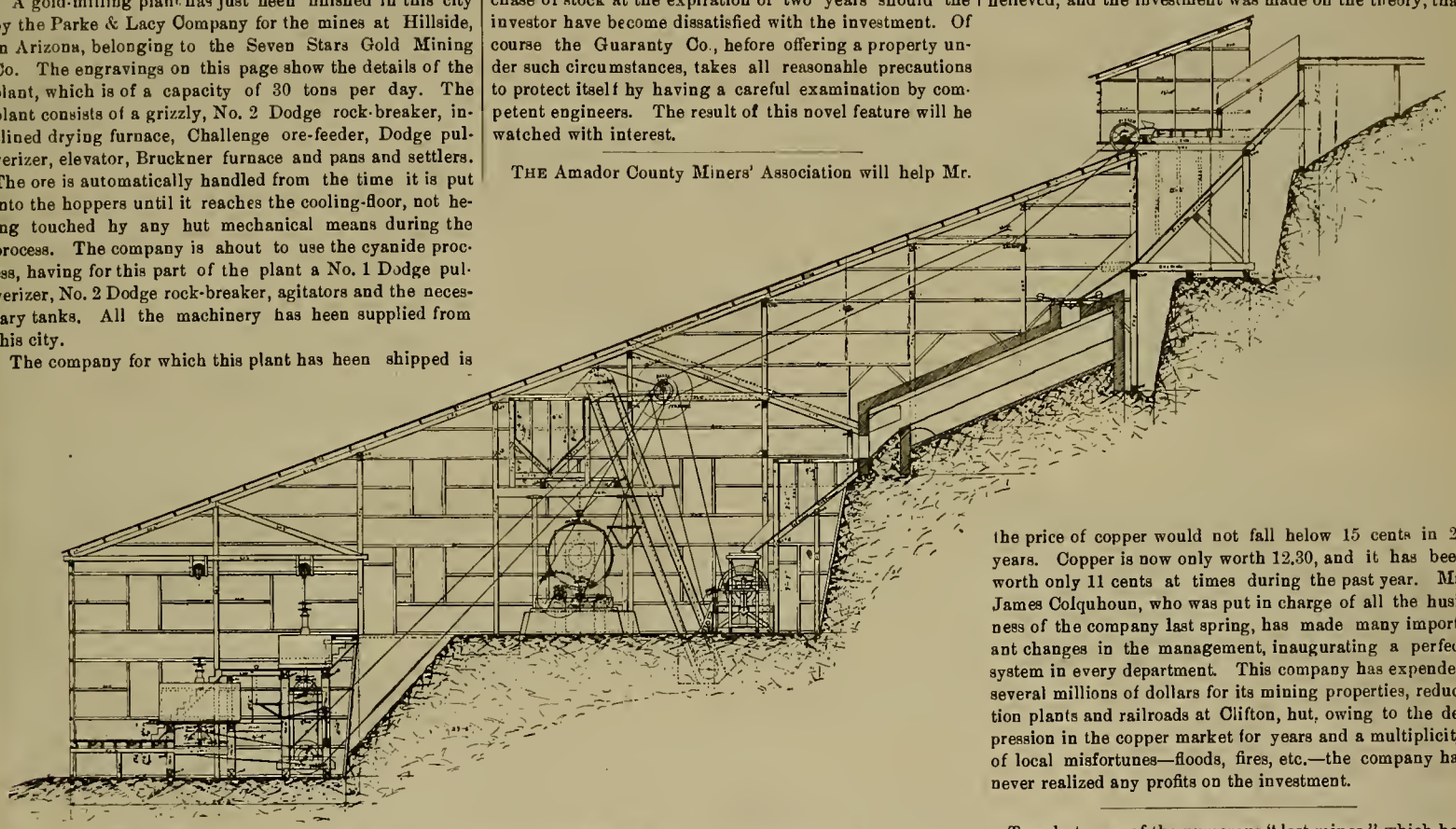
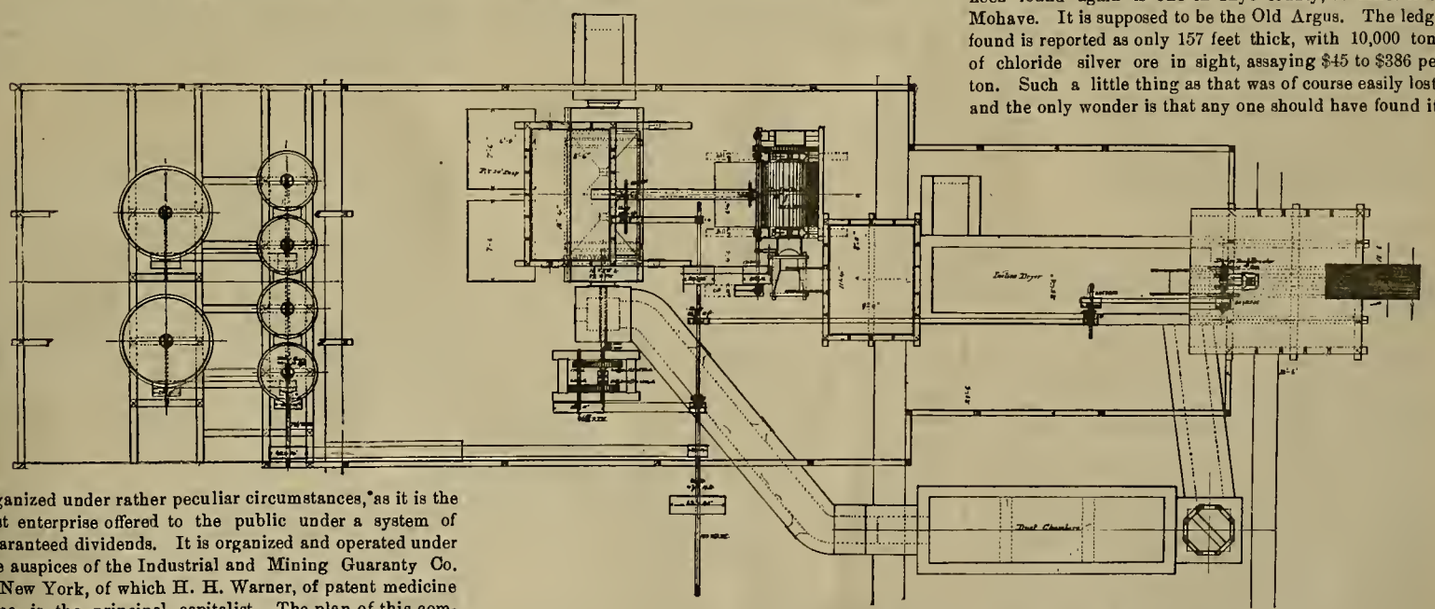
The New Gold Milling Plant at Hillside.

A gold-milling plant has just been finished in this city by the Parke & Lacy Company for the mines at Hillside, in Arizona, belonging to the Seven Stars Gold Mining Co. The engravings on this page show the details of the plant, which is of a capacity of 30 tons per day. The plant consists of a grizzly, No. 2 Dodge rock-breaker, inclined drying furnace, Challenge ore-feeder, Dodge pulverizer, elevator, Bruckner furnace and pans and settlers. The ore is automatically handled from the time it is put into the hoppers until it reaches the cooling-floor, not being touched by any hut mechanical means during the process. The company is about to use the cyanide process, having for this part of the plant a No. 1 Dodge pulverizer, No. 2 Dodge rock-breaker, agitators and the necessary tanks. All the machinery has been supplied from this city.

The company for which this plant has been shipped is organized under rather peculiar circumstances, as it is the first enterprise offered to the public under a system of guaranteed dividends. It is organized and operated under the auspices of the Industrial and Mining Guaranty Co. of New York, of which H. H. Warner, of patent medicine fame, is the principal capitalist. The plan of this company is to eliminate, to a certain extent, the speculative feature from mining investments. The company will protect the stock it sells and guarantee the payment of a stipulated interest thereon for five years. In the case of the Seven Stars Co. the stock was sold at $5 per share and 15 per cent per annum guaranteed for five years. The prospectus also contains a clause providing for the purchase of stock at the expiration of two years should the investor have become dissatisfied with the investment. Of course the Guaranty Co., before offering a property under such circumstances, takes all reasonable precautions to protect itself by having a careful examination by competent engineers. The result of this novel feature will be watched with interest.



THE NEW MILL OF THE SEVEN STARS GOLD MINING CO., HILLSDALE, ARIZONA.



PLAN OF THE SEVEN STARS GOLD MILL.

THE Amador County Miners' Association will help Mr. A. B. Call, appointed committeeman by the State Association, to prepare a mineral exhibit of that county for the World's Fair Association.

WHEN the Arizona Copper Company purchased the Clifton properties copper was worth 18 cents. It was then believed, and the investment was made on the theory, that the price of copper would not fall below 15 cents in 20 years. Copper is now only worth 12.30, and it has been worth only 11 cents at times during the past year. Mr. James Colquhoun, who was put in charge of all the business of the company last spring, has made many important changes in the management, inaugurating a perfect system in every department. This company has expended several millions of dollars for its mining properties, reduction plants and railroads at Clifton, but, owing to the depression in the copper market for years and a multiplicity of local misfortunes—floods, fires, etc.—the company has never realized any profits on the investment.

THE last one of the numerous "lost mines" which has been found again is one in Inyo county, 80 miles from Mohave. It is supposed to be the Old Argus. The ledge found is reported as only 157 feet thick, with 10,000 tons of chloride silver ore in sight, assaying $45 to $336 per ton. Such a little thing as that was of course easily lost, and the only wonder is that any one should have found it. It would be a good kind of mine to keep hunting for, as any amount of "grub stakes" could have been had with such a prospect in view.

Comment.

The drafts of men from leading mines on the Comstock, Nevada and Park City, Utah, during the past few weeks show what is bound to come in other silver mining camps if the price of the white metal goes any lower. In Park City there will be a difference of some $12,000 a month in the pay rolls, and it will amount to more than that at Virginia. The question is, where are these surplus miners to go to for work? All the silver camps are dull, with a prospect of being still duller. It is useless for miners to go wandering off looking for work in camps where men are being discharged. The outlook is rather discouraging.

While silver is selling at 83 cents and lead at $3.70 per hundred pounds, the silver-lead mining camps cannot well prosper. Many mines have shut down and more must follow, unless there is a reaction in values of these metals. California is but slightly affected since its principal product is gold; but Colorado, Utah, Montana, Nevada and Idaho will all feel the effect on their mining operations. The bullion product of those regions must necessarily fall off under these conditions and many men will be thrown out of work. There will be more prospectors in the field, however, as the unemployed miners will take to the mountains on their own account in the spring. They will hunt for gold, coal, etc., and many discoveries may be looked for when the snow leaves the ranges.

The formation of an industrial and mining guaranty company in New York recently should be a good thing for investors as well as for those having good properties which they wish to put on the market, provided it does all it promises. The scope of the new company's work is to take charge of sound enterprises where the plans are projected on legitimate business lines. They profess to have nothing to do with schemes, as schemes. If a man or a syndicate comes to them with an enterprise to be promoted, the enterprise is subjected to rigid investigation. This it must bear unscathed; still an acceptable business is not always accepted by the company. There are conditions to be complied with to which all are not willing to accede. These conditions may be summed up in a sentence. The vendors of an enterprise must put up sufficient capital to pay a guaranteed interest for five years. This being done and the other features being favorable the company organizes the subcompany and puts it on the market guaranteeing not only that the principal invested is secure but that a stipulated interest will be paid for five years. The new company is a promoter pure and simple, but it is not a promoter after the manner of those who float the stock of enterprises, and, having unloaded on the market, step aside and let the investors look out for themselves. At least that is the view of the head of the enterprise, Mr. H. H. Warner, the millionaire patent medicine man of New York. The first mining enterprise started by the new company is referred to on the first page of the PRESS of this week. Such a plan carried out in good faith should work a revolution in the stock business and give some of the investors a chance to make money as well as those who float new enterprises.

At least two of the recent mining excitements have turned out well and with good results—Cripple Creek, in Colorado, and White Hills in Arizona. Of course some of the claims concerning them were exaggerated at first, and as yet there have been no very extensive deep developments. Still, the prospects are quite favorable. In the White Hills the ledges are small but rich, and not the kind that big companies care to take hold of. In the Colorado camp, however, a good deal of capital is being invested and a branch railroad now being built will insure cheap transportation. There has been more of a rush to Cripple Creek than to the Arizona camp, but in both cases the miners who went have remained. This is a good indication of permanency in both districts.

The term of Wm. Irelan Jr., State Mineralogist, runs out in a few mouths, and it will be the duty of the Governor to appoint a new official or reappoint the old one. Mr. Irelan has prepared a strong petition for continuance in his position, and is backed by many prominent mining men. He has held the office many years, during which time he has formed a wide circle of acquaintances in the different mining counties of the State. His most prominent opponent for the position is Wm. C. Ralston, the efficient secretary of the State Miners' Association, and who acted as secretary of the State Mining Conventions of January and November. Mr. Ralston, after taking the mining course at the State University, spent a year or two at practical mining, eventually becoming superintendent of a drift mine in Placer county. He is an active and very energetic young man with many friends in the mining and business community, and would doubtless try his best to make the Bureau practically useful to the mining public. Another applicant for the position is Mr. J. J. Crawford of El Dorado county, who served on the Committee on Resolutions at the recent State Miners' Convention. Mr. Crawford is equipped with a good knowledge of mining matters, and is fully competent to undertake the duties of State Mineralogist if selected. The names of Louis Janin and Ross E. Browne have been mentioned in connection with this office, but neither of these gentlemen are applicants for the position. The selection rests entirely with the Governor, who has thus far expressed no preference and given no hint as to what his action will be. In all probability the appointment will not be made until after the legislature meets, since the report of the State Mineralogist has been referred by the State Board of Examiners to that body, which will doubtless result in a special committee examining into the affairs of the Bureau, at least so far as publication of its reports are concerned. The Governor will be apt to wait for some action by the legislature before considering the appointment to be made.

On page 413 will be found a sketch of the plan for the proposed topographical survey of California. The method by which the work could be carried out is fully stated in the article referred to. The committees appointed to consider the matter have reported favorably on the project, which is now submitted to the people of the State. It is to be noted that only the valley and foothill areas are to be considered, the mountain and mining regions being omitted from the plan. The subject, therefore, interests the agricultural population more than it does the miners. The work is to be entirely topographical, as there would be no geological work in the great valley of the State. For this reason it is the opinion of some engineers that such a survey should be carried out by the U. S. Coast and Geodetic Survey instead of the U. S. Geological Survey. There is, in fact, some difference of opinion concerning the whole matter, it being agreed by certain engineers that the proposed scale is not sufficiently large to serve a useful purpose in irrigation matters, for example. The expense, as stated, would be decided between the State and the Government. As the complete plan is now formulated and in shape for consideration, a discussion of the details is in order.

UNLESS the mining community gives some voluntary assistance to the California World's Fair Commissioners in sending specimens, etc., the exhibit of this State at Chicago will fall far short of expectations. Thus far the people in the mining counties have been rather apathetic.

Foundry Notes.

For the two contracts to dredge the channels in Oakland harbor a powerful dredger of a new pattern, after the patent of Wm. P. Humphreys, is now being built in this city by the National Iron Works. The dredger will cost $55,000, including the pontoons and pipes. There are two contracts. One is for work from the Webster-street bridge, over which the narrow-gauge trains run between Oakland and Alameda westward toward the bay, a distance of about 4000 feet, and the other, in front of Brooklyn, is to be a semicircular channel between 4500 and 5000 feet long. The first contract is to dredge out a channel which shall be 20 feet deep at low water, 300 feet wide, and will require the removal of about 240,000 cubic yards of earth. It is estimated that this work will cost about $96,000. The Brooklyn channel must be eight feet deep at low water, and will require the removal by dredgers of about 220,000 cubic yards of earth, at a cost of $26,000. The sum involved in the two contracts is about $122,000, though the exact amount depends upon the quantity of earth removed in the dredging. All the soil moved must be banked up on either shore in such a manner that it cannot again slide back into the channels made, and all along the edge of the channel a properly piled wharf will be formed, though the building of the wharves is no part of these contracts. It is estimated that all the work on both portions of the channel will be finished in eight months. Work is to be commenced not later than April 1st, and the new dredger will be done before that time. The dredger will require 11 men to haudle, and will be kept working night and day until the two contracts have been completed and the work has been accepted by the Government. The object of this work is to make deep-water wharfage for large-sized vessels. which will be able to load directly from the railroad. At present the depth of water varies from 7 to 12 feet, and with 20 feet at low water there will be draft enough for good-sized graiu ships to go alongside and load just as they now take in coal on the long wharf to the north of the Oakland mole. The contracts let represent about half of the dredging work to be done on the estuary alone, and are the first which will carry the channel to the depth required by the Government.

The Pacific Rolling Mills have not closed down as announced in the daily papers. The usual annual repairs and stock-taking are going on, during which time of course they are running short-handed.

Mr. Graham, of the Vulcan Iron Works, who has been abroad for two months past, has returned.

The preliminary trial trips of the Monterey were made on the bay this week. These trials are not official, but are being made by the builders, the Union Iron Works, so that the vessel may be in complete order and running smoothly when turned over to the Government officers. It is expected that the Monterey's official trial trip will take place very shortly from Hunters Point to Red Rock. To satisfy the conditions of the contract she must produce 5400 horse-power under forced draught, and the contractors will receive a premium of $100 for every horse-power developed in excess of that number. The trial board will consist of Rear-Admiral George Brown, Chief Engineer G. F. Kutz, Captain Louis Kempff, Chief Engineer G. J. Burnap, Lieutenant-Commander E. C. Pendleton, Lieutenants J. W. Carlin and R. S Nicholson, and Naval Constructor D. W. Taylor. The board of engineers will consist of Chief Engineer George F. Kutz, Chief Engineer James Trilley and Chief Engineer George J. Burnap, assisted by eight other subordinate naval engineers. The builders are reticent as to the results of the preliminary trials, and no details have been made public.

Although the Cramps underbid the Union Iron Works on both the new warships, Mr. Irving M. Scott still insists that one of the two should be built upon the Pacific coast, and he will endeavor to so impress the Navy Department. He believes that the award of the contract for one vessel can yet be made to him under the law, notwithstanding the fact that the Cramps were the lowest bidders on both ships. No formal decision has yet been reached in the matter, but it is understood the Secretary of the Navy would like to see a wider distribution of the work and is thinking seriously of awarding one of the contracts to the Union Iron Works of San Francisco, the next highest bidder. There is a difference of $54,000 between the bids of the Cramps and the Union Iron Works for the armored cruiser Brooklyn, and $140,000 for the battleship Iowa. In calculating the difference in the cost of construction between the East and the West it has been customary to add three per cent in favor of the Western firm. If this allowance is now made, the Union Iron Works would get the contract for the new cruiser. The difference between the bids for the battleship, however, exceeds three per cent. Mr. Cramp is, however, determined to keep his contracts, and says, as he made the lowest bid on both ships, he will build them.

The Board of State Prison Commissioners, at its last meeting at Folsom, gave a contract for furnishing the prison with six boilers and mountings to the Fulton Engineering and Ship-Building Company of this city for $6983.

About 100 of the carpenters and mechanics who have been working on the Monterey, at the Union Iron Works. have been discharged. Business is comparatively dull at the shops now, and there is great disappointment among the mechanics in seeing the Cramps of Philadelphia getting both the new vessels to he built. The Union Iron Works counted pretty surely on one of them.

Bids were opened at the Navy Department this week for the construction of an iron and steel pier at the United States coaling station in the harbor of Pago-Pago, Samoa. The two lowest bids were: Coronado Foundry Company, San Diego, $84,697; San Francisco Bridge Company, $88,900.

Personal.

W. J. URTON, of Tuscarora, Nev., is visiting the city.

F. CONN and E. Trudo, mine-owners of Big Pine, Inyo county, are in town.

WM. C. MURDOCK has been appointed a member of the State Fish Commission, vice Morizio, resigned.

W. W. VANDERBILT and Fred Little have taken a lease on the Silver Flake mine in the Agua Fria district, Arizona, and will work it.

GEORGE D. ROBERTS, the old-time Comstock operator, and Colonel D. H. Jackson are in this city after a visit to mining property in Mexico.

THE *Mountain Messenger* learns that Marcus Hobby and brother found a four-ounce nugget in the Live Oak claim, on Ram's Horn creek, last week.

DR. H. H. BEHR read a paper at the last meeting of the California Entomological Society on "The Connection Between Vegetable and Animal Life."

J. D. SCHUYLER, of San Diego, the well-known civil engineer who has been conducting extensive irrigation works in that county, is on a visit to San Francisco.

J. L. HOLLAND, formerly superintendent of the North Star mine in the East Fork district, Trinity county, is now superintending a placer mine at Lytton, British Columbia.

R. G. HART JR. is the superintendent in charge of the Old Diggings mine, and Glanville Hart is the superintendent of the Bullychoop group in western Shasta, belonging to R. G. Hart.

MAJOR Frank McLaughlin, of Oroville, Butte county, the manager of the big river-bed mining operations in that county, has gone East with his family to visit relatives during the holidays.

THE Trinity County Miners' Association, which completed its organization recently, has elected the following officers: Hon. John McMurray, president; J. R. Flagg and P. M. Paulsen, vice-presidents; C. W. Smith, secretary; D. P. Davis, treasurer.

W. A. MERRALLS, inventor of Merrall's system for extracting gold, and of several mechanical appliances for reducing and extracting gold, has established himself in this city. He has been for some time at Los Angeles, but finds San Francisco a better field for his work.

Mr. S. S. TAYLOR has come to San Francisco with the Plumas county mining exhibit, where it will be on display till next spring, when, along with other California exhibits, it will be sent to Chicago. Mr. Taylor has labored with much zeal to secure a collection fitly representing Plumas mining interests.

GENERAL W. S. ROSECRANS, Register of the Treasury, is coming to California to spend the winter in the hope of regaining his health. The General formerly lived here and was engaged in powder manufacture. He was also engaged in mining operations in this State. After going to Washington as a member of Congress from California he remained there, having received an appointment in the Treasury Department which he has since held.

W. C. MINEAR has left Jackson, Amador county, to go to Delta, Shasta county, to take charge of the interests of his father, A. P. Minear, in the Balakala Co., a California corporation, with its principal office in San Francisco. It is a consolidated mining property of 11 mines. The ore is a kind of black iron ore, with gold ranging from $14 to $30; besides it carries a very high percentage of silver, some of it going up into the hundreds of dollars per ton.

MR. C. J. BARBER, who has been for several months prospecting in San Bernardino and Los Angeles counties, has returned to this city. He is quite enthusiastic about some tin prospects which he has discovered and is now developing. He thinks there is plenty of tin in those two counties, and says that because prospectors do not get metal on the croppings they find they should not he discouraged. They will be apt to find the tin on sinking 40 or 50 feet where they find the "black stuff" on the surface.

The Idaho Diamond Fields.

The news from the diamond fields (?) in Idaho is rather sensational in character and hard to be relied upon. Mr. Sanders Kunz of New York, reported to be a representative of a great Amsterdam diamond firm, is reported to have said: "The geology of the country around the diamond fields is precisely the same as in the South African fields and not unlike the fields of Brazil, only not as much broken up. In my opinion these diamond fields will be larger than either those of Africa or Brazil, the blowouts or shafts being a great deal larger and more clearly defined." It is hardly probabe that Mr. Kunz made any such prediction as this after a mere preliminary examination of a day or two. Mr. Kunz is also reported as saying that it had been agreed by the locators that no work should be done upon the diamond ledge until he had returned from Chicago, in which city he would organize a powerful stock company.

The following information is condensed from a special dispatch from Boise to the *Examiner* of this city: "At no time since the reported discovery of diamonds in Idaho, the news of which was given exclusively in these dispatches, has the excitement been greater in Nampa and other surrounding towns than at the present moment. While the statements that the streets of Boise are thronged with eager prospectors are false, it cannot be denied that nearly every person in this city is taking an active interest in the reputed bonanza S. Kunz, the New York expert who went to Diamond Basin on Sunday, did not return to Boise last night, but went East from Nampa. He informed W. F. Mock, of the Nampa Board of Trade, that genuine diamonds really existed in the Diamond Basin region. In proof of this assertion he exhibited four or five small pebbles of peculiar shape, weight and color which he said were rough diamonds."

Coast Industrial Notes.

THE Government estimates for the Benicia arsenal aggregate $33,000. One of the items is for a sewer system to cost $15,000.

LOUIS DUNAND and others have been given the privilege of extending a street railroad from Thirty-fifth street and Potrero avenue.

THE Supervisors have refused to grant Charles Goodall and others the right to run an electric railroad on East street, Broadway and other thoroughfares.

THE State Harbor Commissioners have let a contract for repairing Washington, Jackson, Green, Union and other wharves to Darby, Laydon & Co. for $15.74 per pile.

ARCHITECT Page Brown has submitted to the State Harbor Commissioners further plans for the new depot building at the foot of Market street, and in a few days the board will settle definitely on a general plan.

THE U. S. Fish Commissioners' steamer Albatross will go into dock at Mare Island shortly. A large force of mechanics is at work on her boilers and machinery. Her two Herreshoff steam launches are also undergoing repairs.

AT the last meeting of the Supervisors of this city and county, the order granting the Municipal Conduit Company a franchise to lay pipes and pneumatic tubes for conveying messages and packages throughout the streets of the city was finally passed.

FELIX CHAPPELLET has written a letter in which he promises that his proposed electric road from Haywards to San Jose will be built within the time required by law. He has yet two years in which to complete the work. Enough road has been laid to simply hold the franchises.

THE Howland olive-oil mill at Pomona is nearly completed, and the manufacture of oil will commence shortly. Some of the machinery was imported from Europe, and the capacity of the mill is greater than that of the similar establishments at Elwood Cooper's ranch and National City.

CITIZENS of Fresno have held another meeting to consider the projected railroad between Fresno and Monterey. The road is to be built by people in Fresno, San Benito and Monterey counties. The Fresno people subscribed half of the sum they were to raise at a previous meeting, and at a meeting this week a committee was appointed to solicit the remainder.

LEWIS ANDERSON & Co., the shipping agents of this city, have made arrangements to add a steam vessel to their whaling fleet. Several of their barks have already started on cruises, and the new vessel, which is named the Navarch, is now on her way to Honolulu. From there she will continue her cruise north, and come here next year at the end of the season.

THE Round Valley dam, near Greenville, Plumas county, did not go out during the recent storm as reported. The Round Valley Reservoir dam is intact, and is not at all likely to be dislodged from its secure position. Several years ago the dam was materially strengthened, and it has "waste-gates" by which the water can be prevented from rising above a certain point.

AT Mare Island Navy Yard the Monadnock will soon be hauled up under the big shears, and as her boilers and machinery are being put in and set up, it will then begin to look in reality that she is fast approaching the state to make her an engine of war and destruction. Her guns at Washington are nearly completed, and if required could be brought here on short notice.

THE Oakland Consolidated Street Railroad Company is making another extension to its system. A force of men has been put at work laying tracks down Grove street to Eighth and thence to West Oakland, paralleling the Southern Pacific Company. This will make the third branch from the main system on this road. It is proposed to form a circle by running out Peralta street.

THE Consolidated Piedmont Cable Company of Oakland have applied to the Supervisors to have an ordinance amended so that electricity may be used on their road to the Mountain View Cemetery. When the ordinance was granted originally no provision was made for the use of electricity. The officers of the company say that they are satisfied with the cable system at present, but may in the future replace it by electricity.

THE Nevada City *Transcript* says there is no question about an electric railroad being built between that city and Grass Valley just as soon as the franchise is obtained. A company has already been formed, and Peter Tauthaus, President of the Providence Mining Company, is at the head of it, and all they are waiting for is a franchise from the Boards of Trustees of Nevada City and Grass Valley and from the Board of Supervisors of the county. As soon as these are obtained the work will be commenced.

THE Sacramento Council of the Federated Trades have appeared before the Prison Commissioners and urged the enforcement of the eight-hour law in the employment of guards and others at the Folsom prison. After considerable discussion the board went into executive session and decided to make a supplemental report to the Governor, concluding as follows: "This board believing that in all proper cases eight hours should constitute a day's work, desire to refer the matter to the legislature for such legislation and increased appropriations as may be necessary. This board would respectfully urge you therefore to transmit this report to the legisla'ure."

ONE of the largest wooden sailing vessels ever built in California was launched in Humboldt Bay, on Tuesday, from Bendixsen's shipyard. She is a four-masted barkentine, built for J. J. Smith of San Francisco, and is named the Jane L. Stanford in honor of the wife of Senator Stanford. Her measurements are 200 feet keel, 240 feet over all, 41 feet beam, 16 feet depth, a capacity of 922 tons net and a lumber carrying capacity of 1,250,000 feet. Her first trip will be made from Eureka with a cargo of redwood lumber for Australia, and she will be in command of Captain Johnson. She is the fourth vessel built on the bay and at Bendixsen's yard this year. The schooner C. M. Kellogg, to be launched Saturday, will make the last for the year and the eighty-first vessel built at Bendixsen's shipyard.

SITUATED originally under nearly the same conditions as the Chili niter beds, the quality of the Nevada product some years ago averaged as high as 50 per cent, the maximum purity in a natural deposit. Now, however, it will barely produce five per cent, though some of the material found in crevices runs as high as 40 per cent. It has always been a question of interest to geologists and others as to the source of this niter in Nevada. The water in the Carson and Humboldt rivers contains a certain proportion of the salt, and the fertility of the sage brush lands of the State, when water is distributed over them, is said to be due to a liberal supply of the niter throughout the soil.

The tar springs in San Luis Obispo county are about nine or ten miles from Arroyo Grande, up the Valley road leading to Huasna, on Mr. Sanford's land. They have been leased to a Los Angeles company under the firm-name of 'Tar Springs Asphalt Company." The manager of the company is L. W. Johnson. The natural tar or asphaltum is prepared for market in two large furnaces. Over each of these furnances there are two large troughs or kettles of a capacity of about four tons each. Into these kettles the crude material is dumped from the wagons, and there it is put to boil and kept at a temperature of 280 degrees, Farenheit, for 48 hours, and is then removed from the kettles as fast as the ore is purified by this heat, the pure mineral rising to the top and passing out of the kettle by means of a swinging pipe, which can be lowered to the level of the melted mineral in the kettle, the foreign substances, such as sand, clay, lime, etc., settling to the bottom of the kettle, and is thus separated from the pure asphaltum, which is conducted through said pipes into barrels and allowed to cool, in which state it is ready for shipment. The refuse from the furnaces is used for fuel. This company manufacture their own barrels and have quite an extensive cooper shop on the grounds. They are now working from fifteen to twenty men, and are thinking of increasing their force by more men and a greater output of manufactured material. There seems to be an inexhaustible supply of the raw material. Among other things, it is suitable for the manufacture of ink, black varnish and paints, as well as pipe-dip, roofing and paving; and in its refined state, to which this company brings the material and runs it into barrels, it can reach a wide market, since it will bear long-distance transportation.

Mining Briefs.

ORE pours into Denver, Col., at the rate of 25,000 cars per month.

AT the White Hills, Arizona, the principal work is being done through chloriding, leasing and a few contracts. The ore is in small veins, but very rich.

MINERS have reached Caliente from the Argua range of mountains, where they claim they have discovered a very rich mine. It is in the southern part of Inyo county.

THE North Bloomfield Mining Company has not resumed hydraulic operation under the decision of Judge Gilbert of the U. S. Circuit Court, but is perfecting its system of catchment reservoirs, and will start up next spring.

THE Sierra Valley *Leader* says that John Bassett lately found a very rich quartz ledge in the vicinity of Gold lake, which is two feet wide and assays $400 a ton. A two-foot ledge of one-eighth that value would be a good thing.

GREAT excitement prevails in Truxo, N. S., in consequence of the discovery of gold at the Caribou mines, worked by the Truxo Gold Mining Co. The present discovery is expected to turn out the richest gold mine ever opened in Canada.

SOME of the Placer county papers state that the Red Point mine on the Forest Hill divide has suspended operations. This is incorrect. The mine was closed for a few days only. It is owned by a French syndicate, which has a large investment in the property.

THE Governor of Nevada says, in an interview, that there is not a dividend-paying mine in the State of Nevada. "We will have to find higher grade ores or cease mining." He said that the present low price of silver is responsible for the depression in silver-mining.

JUST after the recent heavy rainstorm, one of the men employed on Mr. Detert's ranch—better known as the old Finn ranch—near Drytown, Amador Co., picked up a gold nugget weighing about 14 ounces, on the bank of the creek, near the dwelling house. The value of the nugget is something over $200.

IT is stated that the original locators of the new San Juan placers surveyed the placer fields into subdivisions and led people to believe that they were locating coal lands, a deposit of coking coal having been found. It was not until the syndicate had placed gold-mining machinery on the ground, instead of coal-mining machinery at the coalfields, that the ruse was discovered.

WITH silver at 83 cents per ounce and lead at $3.70 per 100 pounds, the Anchor mine, Park City, Utah, found it impossible to break even on its second-class ore and was compelled to lay off all men employed in those stopes. The draft has been expected for some weeks. This is the first serious draft which has occurred in that camp as a direct result of the present low price of lead and copper.

THE Rapid City *Journal* quotes William Franklin of the Keystone mine as saying that the prospects of the camp are exceedingly bright, and on the completion of the stampmill in course of construction by the St. Paul syndicate, which several months ago purchased the mine, the camp will at once become a hullion producer of no small magnitude, as its ore is the richest and it has the largest body of any mine in the southern Black Hills.

The San Juan Placers.

No very definite news has been received here this week concerning the new placer fields in Southern Utah. A dispatch from Denver says: "Thousands of people from Arizona, New Mexico, Southern Colorado and Utah are rushing into the new fields on the San Juan. Towns along the Denver and Rio Grande, both in Southern Colorado and New Mexico, are almost depopulated. Nearly 3000 people are already upon the scene, and the new diggings are said to have made prospectors wealthy in a day. It was for some time a matter of conjecture as to the exact location of these placer mines. Investigation makes them most accessible from Durango and Dolores. The distance from either of these points is less than 90 miles. It is rumored that the Denver and Rio Grande is already surveying a line, and tons of provisions are being continually forwarded. Nuggets of coarse gold have been received here ranging in weight from 10 to 15 ounces, and similar to those discovered in California Gulch at the time of the Leadville excitement.

Another dispatch, from Flagstaff, Arizona, says: The first man to return from the San Juan placers came in yesterday in the person of Fletcher Fairchild. The two firms of Lesser & Sawyer and Cass, Tufts & Co., both of Winslow, have men on claims from the mouth of the San Juan 38 miles up, covering up all that is valuable there. Fairchild went 75 miles farther up and thinks he has a better location than the Winslow parties, showing all the way from 10 to 150 colors to the pan, with a good sawmill 15 miles distant at which lumber can be procured at $12 per 1000. There are only 200 men in the San Juan valley all told, but a great many are on their way at present. It is thought there will be serious trouble when the old miners come in over the claims being held by hired men for the two Winslow firms. The new gold fields and their richness are still the most important topics discussed in this and the neighboring towns.

The richest dirt lies in the bed of the San Juan river, and a man can take out from $3 to $50 per day, and the average is $10 per day. The washing is all done with pans. There is no lumber in camp to make sluices and washers. The little lumber shipped there is not for sale, although it could be sold at fabulous prices. There are but few supplies in camp, although there are a good many wagon loads of provisions on their way now, but as it takes a loaded wagon about 15 days to make the trip one way, supplies will be short for some time to come Two restaurants and as many saloons were in operation ten days ago. The weather in the San Juan valley is cold at this season of the year. Snow falls in the valley, but does not remain, but there is plenty of it on the hills around."

The probability is, there is gold in the region, of course, and more or less has been taken out, but concerning most of the ground little is known. No large amounts of gold have been taken out, and little stock need be taken in the yarns about 10 and 15-ounce nuggets. A few nuggets of that size would grow rapidly in number, as any man knows who has had experience with new placer camps. Of course some thousands of men will rush off to this new camp, out of which number a few may be successful. But no credence should be given to the stories of rich placer fields 50 miles long in a region like this, where prospectors have worked off and on for several years. Did such an extensive field exist, it would have been found before this. There are doubtless paying claims, but the extent has probably been exaggerated.

California Wines in France.

At the last meeting of the California State Board of Trade the argument was advanced that the protective tariff duty should be removed from French wines, as a preliminary step toward opening up a market in France for California wines. It was stated that France annually imports from Spain about 300,000,000 gallons of wine for blending and other purposes. These are mostly cheap wines, which do not enter into competition with the better grade of the French product. It was claimed that, if the barriers to free trade between this country and France were removed, the latter would purchase a considerable part of its imported product from the United States, and, therefore, from California. Spain and France are in a commercial union, by which the wines of the former are admitted nearly free of duty, a very small revenue tax only being imposed.

About a year since France changed its revenue laws, adopting a high protective tariff, with provisions for reciprocal treaties with various countries—much the same in scope and purpose as the McKinley law, with the important distinction that the duties imposed are not advalorem. The former duties on wines were as follows:

Wine, from European countries.....4 fr. 50 c. per hectoliter.
Wine, from all other countries.....4 fr. 50 c. per hectoliter.
Alcohol and distilled liquors of all kinds.....30 fr. per hectoliter.
Liqueurs.....30 fr. per hectoliter.

A hectoliter is 26½ gallons, wine measure.

Present duties are:

Alcohol and distilled liquors of all kinds.....30 fr. per hectoliter.
Liqueurs.....30 fr. per hectoliter.
Wine from countries not in commercial union with France....1 franc and 50 centimes per hectoliter for each degree of alcohol up to 11°; and for each degree above 11°, 2 francs and 65 centimes.
Wines from countries in commercial union with France or with a special treaty.....70 centimes per hectoliter per degree of alcohol up to 11°; and 2 francs and 65 centimes for each degree above 11°.
Maximum duty: 1 franc 20 centimes per degree up to 11°, and 1 franc 65 centimes for each degree above 11°, alcohol.
Minimum duty: 70 centimes per degree up to 11°, and 1 franc 65 centimes for each degree above 11°, alcohol.

It will thus be seen that a sliding scale was fixed on imported wines, the effect of which was greatly to increase the duty on vinous exports from this State. The aggregate of shipments from this State to France is, under this tariff, about 200,000 gallons per year, an almost infinitesimal total.

Negotiations are now said to be in progress for the establisbment of reciprocal trade relations between the United States and France. Their exact nature is not a matter of public knowledge, but it is expected that, if concluded, California wines will be admitted on a minimum duty, and the standard French brands will have similar freedom of entry into this country; or, at least some important French product will escape the high protective tax. It is claimed that the United States will receive more than it gives, under this arrangement; that, in the American market, the French wines and the California wines have their distinct place, and that the consumption of either will not be materially effected by a change in the tariff. That is to say, the two wines are not, strictly speaking, competitors, and the French wines will not, by reason of cheapness or otherwise, drive the California wines from the field, or vice versa. Whether this be true or not, there is a serious movement to get some important modification of the rigid provisions of the French tariff against American wines, and to make similar concessions under the reciprocal provisions of the McKinley law. If the negotiations for a commercial union fail, it is likely that the agitation will be continued before a Democratic Congress, to make an absolute reduction of the tariff on wines to a revenue basis, in the expectation that response in kind will be made by France.

The Asbestos Industry.

Mining and Preparing the Product for Market.

Until 1897 Italy supplied nearly all the fibrous asbestos required by the world, but in that year a number of companies were formed to work the veins known to exist near Thetford and Black lake, in the Province of Quebec, Canada. Since then, owing to the constantly extended use of woven asbestos,, the working of this mineral has become of considerable importance. According to the official statistics of the Canadian geological survey, the value of the asbestos in Canada in 1891 was $1,000,000, being exceeded only by that of coal, nickel, copper and petroleum. This industry is now in the bands of two incorporated companies, having an authorized capital of about $3,500,000, of which $2,125,000 are invested in the industry in Canada.

A paper on the "Canadian Asbestos Industry" was read before the General Mining Association of Quebec by L. A. Klein, A. M., of which an abstract is published in *Stone*. We republish this for the information of those owning asbestos deposits in California. Considerable quantities of this mineral are produced in this State, but there are many known deposits which are not worked. The description of the method of preparing the material for market will interest many miners here.

To prepare the asbestos for market two operations are necessary, viz., the mining proper and cobbing or separation of the ashestos from the adhering serpentine. At most of the mines the drilling is done by steam or compressed air, 45 feet of hole per day of 10 hours in the former case and 50 to 55 feet in the latter being considered a fair day's work, at an average cost of seven to eight cents per foot of hole drilled. At present there are in use seven compressors, with a total capacity of 44 drills, and there are 44 steam drills.

The average cost of drilling amounts to three and one-half cents per ton of rock broken.

Dualin, which contains 33 per cent nitroglycerin and costs 20 cents per pound, is the explosive used; it is fired by electricity. The expense for explosives is about three cents per ton of rock. The broken rock is roughly sorted in the pit, the waste rock being sent to the dump by wheelbarrows, or in the larger mines by derricks, and the crude asbestos to the cobbing-sheds. The cost of this averages 25 cents per ton of rock.

The second and most important part of the work is the dressing or cobbing of the ashestos and then grading it. This grading is generally done by band by boys. Some of the mines have, however, partially or entirely adopted machinery for this purpose, in order to avoid the loss of asbestos contained in the so-called cobbing-stone, *i. e.* large pieces of rock with a vein of asbestos in it, which did not separate by the blast and which can only he separated by heavy sledge-bammers, or by crushing.

The first to try to solve this problem was the Scottish-Canadian Asbestos Co. Their plant consisted of a Blake crusher, traveling picking tables, Cornish rolls, revolving screens, elevators, chokers and blowers.

THE ASBESTOS INDUSTRY.

The mines of this company were closed during 1888, and it was not until the winter of 1890–91 that the American Ashestos Company started to experiment in this direction, the main object being to do away with what is known as grade No. 2. At this plant the crude ashestos is conveyed by an inclined railway, and automatically dumped in front of a Blake crusher, the jaws of which are set at 1½ inches. The crushed ore drops on an inclined sieve in shaking motion, which separates all the loose fibre and the dust from the larger pieces of rock and asbestos veins, the former going directly to the cleaning or grading machines, the latter dropping on a revolving picking table, where the barren rock is removed by hand to one side of the table, the asbestos veins being left on the other. At the end of the table is a receiving chute which is divided into two compartments, and into which rock and ashestos are discharged respectively. The rock drops from the chute directly into a larry and is wheeled to the dumps, while the asbestos is conveyed either to the kilns, necessary in winter time or rainy weather, or to the fine crushers for further treatment. These latter are of unique construction, of which the object is to allow particles of a certain size and loosened fibre to go through, without being further crushed, as therehy the asbestos fibre is likely to be injured. This so reduced stuff is brought to the cleaning and grading machines, consisting mainly of a set of inclined sieves in rapid shaking motion in connection with blowers, fans, etc., while the remaining unbroken stone and unloosened fibre goes back to a set of still finer crushers to undergo the process again. The plant at King Brothers' mines in Thetford, which was principally erected for the extracting of asbestos out of large pieces of rock on the old dumps, which some years ago did not warrant the expenses for hlock-holing and further handling, consists of a Blake crusher, from which the stuff is conveyed on a set of Cornish rolls, with the intention of having all stone reduced to powder, from there to a revolving screen, of which the object was to screen out all the dust and leave the clean fibre. This object, however, has not been fully realized, owing to the failure of the rolls to break up the rock entirely, and an additional hlowing and screening plant has been put in, which produces now a very clean product of one grade,

The Anglo-Canadian also runs a crusher and a set of sieves, and the Johnson's company has recently put in a couple of crushers to overwork the old dumps. None of the processes at their present state, however, may as yet be considered complete, the main difficulties being two:

1. That, if asbestos is crushed with a considerable amount of stone, until the latter is reduced to powder—the long and most valuable asbestos is partially destroyed.
2. If the stone is not entirely reduced hefore grading it, is nearly impossible to free the fiber from the stone, and a large amount of waste is the result.

The cost of cobbing, according to Mr. Klein, varies considerably, according to the quality of material. While some asbestos will break from the stone very easy, other requires considerable labor; then larger veins will sooner be gathered than small ones. He places it, including the breaking of the cobbing-stones, at $7 per ton at the leading mines.

The asbestos after being graded, which is, however, in the entire discretion of every particular mine, is put in bags of 100 pounds each. Cost of bags is from 5 to 6 cents each; cost of bagging, 20 to 25 cents per ton. The cost for transport to cars and loading varies from 10 to 60 cents a ton, according to distance from railroad.

In estimating the cost per ton of asbestos, Mr. Klein says: "On this subject the opinions of the asbestos quarrymen are very different, and while some claim to mine only 50 or 60 tons of rock to the ton of asbestos, others go as high as 150. I am of the opinion that as a rule the quantity of rock mined to the ton of asbestos is greatly underestimated. Basing, on the capacity and actual work of our machinery appliances, the known quantity of larry loads removed from a mine during a year, and the known average weight of each load, in relation to the totals of asbestos produced, I hold that one ton of asbestos to 100 tons of rock is a fair average. If we accept this, the cost of production of asbestos may be set down as follows: Drilling, 3½ cents; blasting, 3 cents; labor for removing rock and gathering asbestos in the pits, 25 cents, making a total of 31½ cents to the ton of rock, or $31 50 to the ton of asbestos; $7 for cobbing; $1.50 for bags and hagging; 50 cents for loading; $5.50 for supplies, which includes fuel, tools, iron, steel, timber, other materials and repairs; $6 for general business expenses, such as management, insurance, offices, marketing and others; $3.55 ten per cent wear and tear, calculated nn a total of $355,000 in plant, making a total of $55.55 to produce one ton of asbestos. If we calculate now that we have to pay interest on a total invested capital of about two and one quarter millions of dollars, for which at least ten per cent must be expected, we bave in our sales to average a price of at least $80 per ton of asbestos."

The output of asbestos in 1880 was hut 380 tons, valued at $24,700. Since then the industry has steadily increased, with the only exception of 1888, and reached in 1890 8860 tons, with a value of $1,200,240. During the period between 1880 and 1890 the increase has been nearly 2600 per cent in toonage and 5100 per cent in value. Since 1880 the prices have been as follows: 1880, $65; 1881, $65 1882, $65; 1883, $72; 1884, $65; 1885, $58; 1886, $59 75; 1887, $49; 1888, $60; 1889, $69.75; 1890, $127; 1891, $111. During this time the imports of asbestos hv the United States have increased from $9786 in 1880 to $254,935 in 1890.

A Mark of Appreciation.

TO THE EDITOR:—Why should one not speak out his appreciation of men and their work, as well as criticise an article or process? Mr. Aaron's brief reminiscence was so happily worded, so quaintly clothed in pleasing allegory, that one can scarce help wishing to know more of the man, and especially one who possesses such rare devotion to bigh principle as to play the unknown knight in the manner told.

As Mr. Aaron says, the MINING AND SCIENTIFIC PRESS is more than a mere newspaper; it is in quite a high sense a public educator. Such being the case, I believe it would not he derogatory to the dignity of the paper to give a brief biography, or at least resumé, of the work of such men as Hanks, Aaron, Stetefeldt, Attwood and Paul, all of whose efforts have been to give the coast better processes, better views, and, moreover, an understanding that there is in mining a rare chance to use careful and scientific methods.

Why wait until a man is dead to speak well of him; to utter a few simple truths, when the same said in life would brighten the way and instill a little more "milk of human kindness," which would in turn reflect on those about, and all therehy be made happier.

I confess that I have sat at the feet and learned of one of the gentlemen named, have often called to my aid the bound publications of two more mentioned, and a thousand times felt indebted to all. I willingly admit that I am of a younger generation of chemists, but it will he with unfeigned regret that the voices will he "heard to cease" of those staunch old predecessors who have bequeathed us such a legacy of good example of devotion to "pure truth."

B.

A Proposed Topographical Survey of California.

An important movement for good maps has been making headway in this country in the last few years. Several of the Atlantic States have been completely surveyed.

It is proposed that California take up this movement on the Pacific coast. A plan is here submitted, modeled and improved upon that adopted in the eastern States, whereby a detailed general map of permanent value may be secured for the more valuable portions of California, through the agency of the topographical section of the U. S. Geological Survey, and at a cost that would be divided equally between the State and the National Government.

Maps of the kind here proposed are practically new to America. The Coast and Geodetic Survey has for many years persistently set the right example in its belt of topography along the seaboard, but over the great interior we have had until now only samples, with which the people are unacquainted. Maps in America, like our had roads, against which there has recently risen in the East such popular outcry, exhibit a striking crudity in contrast with European examples everywhere. We may be said practically to be without maps; and, because we have not had them, there has been no general recognition of the great importance of detailed general surveys to lightly settled regions like California, just beginning to introduce complexity into their engineering development.

The modern map is a contour topographical map, giving accurate measure of the relief of the surface, comparatively of great size, much too large for a wall map, and published in numbers of comparatively small sheets, each having about the proportions of a newspaper page. Massachusetts has 52 of these atlas sheets (so-called), which together cover its entire area. Joined, with the margins cut off, they would make a continuous map. They are bounded by quarter-degree lines of latitude and longitude, 15 minutes each way, covering a ground area, each, of about 240 square miles, varying slightly with the latitude. The scale is one inch to one mile. They show all the natural features of the ground, and all the artificial features of a public character.

Though these maps are many times larger than our ordinary wall maps of the States, and wholly different in character, they are, on the other hand, much smaller in scale than what may be termed engineers' plans. To extend such work as these engineers' plans over the area of a State would be magnificent, but it would not pay. In a country like California the cost would approximate too closely to the value of the land itself. Furthermore, as scale is increased the area that can be inspected at a glance rapidly diminishes, and comprehensiveness and general usefulness are lost in the multiplication of sheets of small areas. The modern topographical map is the engineers' plan in miniature—a map for general purposes; detailed and accurate to the limits of its scale; and long experience in Europe has fixed that scale at one inch to one mile.

The desirability of such a general atlas-sheet map for California may, in a general way, be indicated by an enumeration of advantages: (1) It would afford a uniform base for the record and comparison of statistical facts, and for the illustration of a country's products. (2) It would serve for the preliminary planning of public works, such as the selection of routes for either roads, railroads, or canals, by exhibiting all the possibilities and impossibilities for the special undertaking in hand, in a general way, thus obviating the necessity for many trial surveys, and suggesting possibilities that the trial survey might not discover. (3) It would aid in the proper understanding and just solution of many perplexing controversies, such as that between the hydraulic miners and the agriculturists. (4) It would prevent the development of radical mistakes in complex systems of irrigation, which might eventually necessitate expensive remodeling. (5) It would serve as a base for the rapid, easy, and accurate production of agricultural product and soil maps, and for the study of the bearing of altitude (irrespective of soil quality) upon horticultural products. (6) It would simplify and facilitate the solution of our forestry problems that are rapidly growing in intricacy and importance. (7) It would aid in the planning of better highways for the readier transportation of farm products. (8) It would greatly stimulate scientific research. (9) It would facilitate travel for business, and would encourage and enhance the interest of travel for pleasure. (10) As our last war abundantly demonstrated, it would vastly simplify military operations; and, finally (11), it would have a high educational value, important, yet as difficult to define as the importance of culture in general.

For a hundred years European countries have been struggling with the map problem, so important is it considered to be. The chief difficulty has been with the question of scale. That question is now generally decided in favor of about one inch to one mile. Present results have been achieved at vast expense, though an expense many times greater than that at which they could now be duplicated. We can benefit by this costly experience; and, if to densely populated Europe good general maps are a desideratum, how much more desirable must they be for a State almost at the beginning of its settlement.

To bring it about that California shall take up, on the Pacific coast, this movement for good maps, if desirable and practicable, a number of committees, representing the University of California, the Leland Stanford Jr. University, the Technical Society, and the Academy of Sciences, have together held a series of meetings.

Their work has been as follows: (1) Examination into the needs of California; (2) inquiry as to what work of similar character has been done in eastern States; (3) correspondence with the director of the U. S. Geological Survey, and with the superintendent of the U. S. Coast and Geodetic Survey; (4) personal conference with the director of the U. S. Geological Survey in regard to the practicability, and the terms, of a possible cooperative undertaking between that Bureau and this State; (5) examination, in the field, by certain members of the committee, of similar work now in progress by the Geological Survey near San Francisco, and examination, by the full committee, of recently finished sheets of that work; and (6) the careful preparation of specifications for the proposed work, agreement to which has been obtained from the Geological Survey.

These specifications are as follows:

1. That the map be a complete contour topographical map, based upon triangulation and leveling, and constructed by plane-table survey, showing, in addition to the natural features, (1) all existing monuments of township and land-grant corners; (2) all railways, canals and public distributing ditches; (3) all public roads, and all other roads in unrestricted use, and therefore virtually public; (4) all county boundaries; (5) all cities, towns, villages, hamlets, prominent mines, and other important places, with indication of their buildings, together with all isolated dwellings and public buildings outside of town limits.

2. That in each township at least one permanent bench mark be made, with record of the precise altitude above mean sea-level.

3. That all contours be on a scheme involving intervals of five feet or multiples of five feet, according to the slope of the ground, and that the contour interval be uniformly five feet wherever the slope of the ground is less than 15 feet to the mile, in which case contours will be traced out by actual leveling.

4. That all navigable streams and important watercourses be located by continuous survey of their banks.

5. That salt-marsh land and fresh water swamp-land be distinguished by distinct conventions, and that there be indicated for the boundaries of the same the natural limits, not the legal segregation limits.

6. That there be at least three triangulation points to each plane-table sheet.

7. That the field-scale be not less than one and one-third inches to a mile, or three-quarters of a mile to an inch.

8. That the publication scale be one inch to one mile.

9. That the size of the atlas sheets be that of a quarter-degree square, limited by the even 15-minute lines of latitude and longitude.

10. That the U. S. Coast and Geodetic Surveys be requested to contribute as many triangulation points as possible.

11. That the headquarters for the survey be in California.

12. That the work be done by the U. S. Geological Survey, under supervision of a commission of five persons representing the interests of California, of whom four shall be appointed by the Governor, one to be a representative of the agricultural interests of the State, one a representative of the mining interests, one on nomination of the State University, and one on nomination of the Leland Stanford Jr. University; and of whom the fifth commissioner shall be chosen by the others so appointed.

13. That the expense of the survey be divided equally between the State and Federal authorities.

14. That the U. S. Geological Survey engrave the copperplates for all the map sheets wholly at its own expense, and that it own the plates, and that the State of California have the privilege of taking electrotype transfers from each and all of such plates for its own use.

The preparation of such a map would necessarily be a work of years. Each atlas sheet, however, corresponding in area to about 6½ townships would in itself be a complete map, independently surveyed, engraved and published. Interruption or termination of the work at any stage, therefore, would not affect the value of what had already been accomplished.

It is not recommended that the work be planned to eventually cover the entire State; the Geological Survey is now engaged independently on a similar survey, on the smaller scale of one inch to two miles, of the Sierras, and may eventually map all of the mountainous regions. It is suggested rather that the aim should be to survey the more valuable areas of the State only—the habitable areas and the otherwise economically important areas—and that beginning should be made simultaneously from several of the more thickly-settled centers.

It is believed that the best interests of the work would not demand a larger expenditure than $50,000 annually. By the terms of the proposed arrangement with the U. S. Geological Survey, one-half of this annual expense would be borne by that Bureau. The cost of surveying the atlas sheets would average about $3000 each, and it is thought that the annual product of the survey would be from 15 to 20 of these sheets. The cost of engraving would not have to be shared by the State. The cost of electrotyping and printing from time to time could be more than covered to the State treasury by selling the sheets at a uniform cost of ten cents each.

It is thought that to survey in this manner the whole of the valleys and foothill areas of the State, together with a small percentage of the more important mountain areas, would take ten years of time and call for a total expenditure by the State of $250,000. Presumably the rate of progress might later with safety be considerably increased and completion of the work hastened; also, it is recognized that, as the work progresses, it might be found desirable to increase its extent.

The atlas sheets for the valley and foothill areas, with liberal construction of the term foothill, would number from 150 to 200. The total number of similar sheets of the Massachusetts survey was 52, and of the Rhode Island, the Connecticut and the New Jersey surveys, each proportionately less, but for the State of New York, which last year made its first appropriation toward a plan almost identical with that here proposed for California, the total number of sheets will be something more than 200.

By increasing the scale to that of the engineers' plan, the cost would be increased enormously and the number of atlas sheets multiplied to many thousands.

Upon the joint agreement of the committee and the director of the Geological Survey to the foregoing specifications, the committee unanimously indorsed the above-outlined plan for a topographical survey, and herewith begs to submit that plan, with its favorable recommendation, to the people of the State.

JOINT COMMITTEE.

Joseph Le Conte, Chairman; Andrew C. Lawson, Secretary.

For the University of California—
E. W. Hilgard, Professor of Agriculture.
F. Soulé, Professor of Civil Engineering.
S. B. Christy, Professor of Mining and Metallurgy.
Andrew C. Lawson, Associate Professor of Mineralogy and Geology.

For the Technical Society—
C. E. Grunsky, C. E.
W. G. Curtis, C. E.
H. Vischer, C. E.

For the Leland Stanford, Jr., University—
J. C. Branner, Professor of Geology.
C. D. Marks, Professor of Civil Engineering.
G. M. Stillman, Professor of Chemistry.

For the Academy of Sciences—
H. W. Harkness, President.
F. Scupham.
T. S. Brandegee.

For the Science Association of the University of California—
Joseph Le Conte, President.
E. Greene.
W. E. Ritter.

Asphaltic and Bituminous Products.

We have received from Mr. Leon Malo, consulting engineer, of Seyssel, France, an article on the "Nomenclature of Asphaltic and Bituminous Products," in which he urges that, to avoid confusion of terms, he adopted a nomenclature 25 years ago, to which no objections were made until 1888, when Capt. F. V. Greene, in a paper before the American Institute of Mining Engineers, read at Buffalo, N. Y., objected to Mr. Malo's use of the word asphalt to designate a natural combination of bitumen and limestone only. Mr. Malo's article, it should be added, was translated by Mr. W. H. Delano, Paris.

Mr. Malo classifies bitumen, according to its combination with other metals, as follows:

(1) When bitumen impregnates limestone by a natural process the product is asphalt. (2) When bitumen agglomerates quartzous or quartzo-calcareous sand, the product is bituminous sand. (3) When it is mixed with clay the product is Trinidad Lake pitch. (4) When mixed with bituminous limestone (*i. e.*, asphalt), melted and run into blocks, such as are used for sidewalks, the product is bituminous mastic."

Mr. E. P. North, M. Am. Soc. C. E., in a paper on "Construction and Maintenance of Roads," read before the American Society of Civil Engineers, April 16, 1879, and since published in the book entitled "Road-Making and Maintenance," says that asphalt and bitumen have been used as interchangeable terms by dictionary makers and chemists. He then gives definitions of these words and of asphaltic mastic by Mr. Malo, as follows:

Asphalt; bituminous limestone.

Bitumen; the black and viscid substance which we find disseminated in the pores of bituminous limestone and in the interstices of the "molasses" of Seyssel or the sands of Auvergne.

Asphaltic mastic; bituminous limestone transformed by dressing and by the addition of a small quantity of bitumen.

Mr. North states that "it is believed" the above definitions have been generally accepted in Europe, and employs the words with the same meaning in his paper, with the exception that the bitumens from Trinidad and Cuba are included. To cover American practice, Mr. North added the following definition:

Bituminous Mastics.—Mixtures of bitumen, either having an earthy "gangue," like those of Trinidad and Cuba, or purer ones, like grahamite and albertite, with limestone or other substances not naturally impregnated which add to its resistance to wear.

The facts of the case seem to be says the *Engineering News*, that Mr. Malo's restriction of the word asphalt to designate bituminous limestone, or natural-rock asphalt, answered very well in Europe, where bituminous limestone was chiefly used, but in this country we have not found it convenient or in any way desirable to restrict a word of universal application to the bituminous products of one locality. It is not easy to see why bitumen naturally combined with limestone should be called asphalt, while the same material in larger proportions combined with alumina and silica, oxide of iron and lime, the chief mineral components of the Trinidad product, should be called Trinidad Lake pitch. In its earliest use the term asphalt was applied to the bituminous matter itself, and not to a combination of this with any other mineral. From this point of view, the Trinidad product, far more than that of Seyssel or Val de Travers, is worthy of the name asphalt, since it contains about four times as much bitumen. Natural asphalt sandstone rock is now found in California (*Engineering News*, Jan. 8, 1887, Nov. 30, 1889), so any claim to the exclusive use of the term asphalt to the bituminous limestone of France or Switzerland because this is more nearly ready to be put into pavements, is not now, if ever, valid.

The word asphalt in various forms is found in the Greek, Latin, Italian, French, Spanish, Provencal and Middle English languages. It is of undetermined foreign origin, but has been employed from the earliest times to designate bituminous products used as cements.

The Century Dictionary defines "asphalt" as nearly synonymous with "bitumen." We see no reason for questioning the propriety of this definition, nor for attempting to restrict the single word "asphalt" to what is now generally described as "natural-rock asphalt." Certainly this is not now the popular meaning attached to the word. Every one thinks he has some idea of what "asphalt" is, and yet a majority, perhaps, of intelligent men who are not engineers do not know even that there is such a thing as natural-rock asphalt, having rarely or never seen the rock itself.

Mechanical Progress.

How Needles Are Made.

Needles are manufactured out of superior quality of cast-steel wire cut into lengths to make two at a time. Pieces are straightened upon an iron table by means of an instrument termed a "rubbing knife." The wire is then pointed by automatic machinery provided with a fan or shaft to carry away the steel and grindstone dust, which is very injurious to inhale. In former days the lives of workmen employed in the needle trade were considerably shortened by breathing air charged with particles. Indeed, the following is a narrative told by a doctor in the district of the industry concerning a patient, a hand needle-pointer by trade, who complained that he felt a hard ball of something in his trachea, which rose and fell between his chest and throat. The doctor ridiculed the idea and told him it was nonsense, hut the man still persisted it was there, and asked him if he died to examine him. After the poor fellow's death a post mortem examinatlon was made and resulted in a solid mass of steel and stone dust about the size of a bird's egg being found, as he had said, in his throat, and the lungs were so encrusted with steel that a knife would scarcely pierce them. It was therefore truly a blessing to these busy workmen when this deadly process was done away with, and in its stead a healthy one substituted.

After the operation of pointing, the wires are stamped and then pierced to form the eyes. As the diameters of the wires used in this industry are usually very small *e. g.* .03 of an inch, it will be readily apparent that the above process involves considerable accuracy and skill. The "burrs" produced by stamping are afterward removed by means of flat grindstones called filing machines. A "spit" of these double needles is next placed between a hand vise, termed "clams," and divided into single ones, requiring only to have their heads "rounded" by filing to furnish the complete articles.

A finished needle, however, must have a hard and elastic temper, whereas these, in their present state, are softer than the wire out of which they were made. Therefore, after the needles have been burnished in the eyes, they are hardened by heating in an oven, and subsequently cooled by plunging them into oil. This rapid cooling of the steel makes it as brittle as glass. The needles will now almost break upon touching them, indeed, in this condition they would be as useless as in the soft state. To reduce them to a perfect state of elasticity, temperature has to be again raised about 600 degrees, and then by allowing them to cool gradually the required degree of elasticity is obtained. During the process of hardening, the fire makes many of the needles crooked and these have to be picked out and straightened by a small hammer, one at a time, on an anvil. The heads are afterward softened by the application of heat for facilitating burnishing. The process of scouring the needles bright takes about a week. They are mixed with oil, soft soap and emery powder, wrapped in loose canvas, and placed in a kind of mangle worked by mechanical power. This scouring process done, the needles are washed in hot water and dried in sawdust.

The points, slightly blunted by passing through the various processes described, are now set upon a small revolving grindstone and the eyes reburnished. The next operation is that of polishing the needles, and which is performed by a rapidly rotating wheel covered with prepared leather. The needles are caused to pass many times over the leather in order to thoroughly polish them. Finally they are counted and stuck by women into cloth, wrapped in paper, and labeled for the market. — Chicago Journal of Commerce.

GETTING IT DOWN FINE IN SCREW MANUFACTURE.—An instance of remarkably fine mechanical work is that described by Prof. Rowland, the distinguished microscopist, says an exchange, who has now succeeded in manufacturing a screw for his dividing engine which is said to be more nearly perfect than any other of tbe kind ever produced. It is made of the best steel, is 1½ inches in diameter, 17 inches long, and with 20 threads per inch; was first cut in a lathe in the ordinary manner, then ground by using a nut equal to it in length, which was placed on it with washed emery, and the screw revolved under a bath of water and oil maintained at a constant temperature. The grinding required about three weeks. It is to be used mainly in ruling gratings for spectroscopes, and it is thought will be capable of ruling a million of lines to an inch. In the head attached to the screw there are a thousand notches, so that the movement of a notch advances the thread 1–20,000 of an inch. It may be remarked that M. Behrens has lately stated to the Amsterdam Academy of Sciences that, under high powers of the microscope, the network in hardened steel may be made visible on polished slices without etching or annealing, the dark, sinuous lines answering to the bright ones shown by Sorby on etched slices, and it is proved that hardened steel contains hard granules bound up in a matrix of soft iron.

The Care of Gas Engines.

The increased use of gas engines, remarks the *Engineering Record*, and the wide range of work to which they are now applied, make the following notes on their care of considerable value. These hints have been taken from a variety of sources, and relate to tube-ignition engines alone. In this type, the tube itself should he carefully looked after, since several charges may he drawn into the cylinder without any explosion, if it is in bad condition. Sometimes an engine refuses to start, and in such a case it will often be found that the tube is enlarged and covered with scale. It should be carefully removed as soon as it is seen to be in this state, care being taken that none of the scale gets into the passage leading to the cylinder. There is no necessity for heating these tubes to anything near a white heat, and they are apt to cause much trouble at such a temperature. If the tube will not heat, the trouble may be due to the Bunsen burner or to draughts. Tubes of a special alloy are being put on the market by the Otto Gas Engine Works, which will not deteriorate rapidly (their lifetime exceeding one year) and thus avoid many of the troubles mentioned.

Most engineers are accustomed to at once attribute loss in compression to the valves, but this can be easily determined by turning the flywheel. If very little compression is felt, the trouble is probably due to dust and grit getting between the valve and its seat, or to the sticking of the valve-spindle in its gland. In the first case the grit can he removed by turning the valve around a few times, so as to grind the dust away. If the valves stick, a little *coal* oil is to be poured on the spindle, which is to be worked sharply back and forth until the springs will bring it down on its seat in the proper manner.

The springs are also apt to become weak and should then be at once replaced. A small loss in compression is quite important, since the power developed by the explosion depends considerably on the density of the mixture, and it has been found that the lower the amount of compression the richer must he the mixture in order to have good ignition.

After an engine has been knocked down for removal or repairs, and is then again set up, care should be taken that the cams working the valves are set in the place they formerly had. If the teeth on the wheel of the crankshaft are set forward on the wheel keyed to the camshaft, the exhaust valve will be opened too soon and part of the force of the explosion be allowed to waste up the exhaust pipeshaft. If the wheels are set a tooth or two backward, the explosive mixture will he forced into the airbox, with results that may be extremely unpleasant in some style of engines.

Joints and packings in gas engines should give no trouble when the right material is used. They will give out and need replacing only, when cooling water is not turned on for a considerable length of time. For all joints exposed to the inner heat of engine, especially near the exhaust valve, asbestos board is used, and between the cylinder-head and cylinder the same material, but of slight thickness, will answer. Any attempts to use rubber-packing will result in failure after a short run. Rubber-packing may be used only on outer joints against water, where water-jackets are castings independent of the cylinder. Leaks of inner joints are generally detected by an accumulation of water overnight inside of the cylinder. There is no trouble in detecting leaks outside of the cylinder, and there is no loss of power from such source.

THE power plant at the World's Fair is to be made up of all the principal American makes of boilers, engines and dynamos, the units being of all sizes up to 1000-horse power. While such a plant is a necessity to the Exposition, the idea has been at the same time to show as many different types of machinery as possible in actual operation, and manufacturers have been only too glad to take advantage of this opportunity to display their apparatus. The designs call for the delivery of over 30,000-horsepower in steam, which gives some idea of the size of this power-distribution station.

Scientific Progress.

Cholera and Ozone.

The fact that electricity enables ozone to be generated cheaply and on a large scale, says the *Electrical World*, may have a most important bearing in the future as a sanitary measure, more particularly, however, in relation to cholera epidemics. That some connection exists between the spread of cholera and the scarcity of ozone in the atmosphere there appears to be little doubt, from observations begun as early as 1884 and continued ever since. There is a normal amount of ozone in the atmosphere, and it appears from these observations that at places where the cholera existed the amount of ozone in the atmosphere was below this normal, sometimes even to a very marked degree. Moreover, an increase in the epidemic in certain localities seemed to go hand in hand with a diminution of the amount of ozone in the air. During the early part of the 1884 epidemic in Paris and Marseilles the quantity of ozone in the air was found to be decidedly below the normal. This itself would point to some connection between the two, but an additional fact of great importance is that tests made at the same time in other places which were free from the epidemic showed the presence of a normal amount of ozone. Tests made since by numerous observers appear to have confirmed this coincidence. The fact that some relation may exist between the two would not be surprising, as cholera, we believe, is now recognized as a germ disease, and ozone is well known to be a very effective germicide. It is, moreover, an excellent means to use, because if properly made it is not in the least injurious to human beings. When made by chemical processes or from oxygen, it may be injurious, but this is owing to impurities or to the presence of untransformed oxygen. If, however, it is made of air ozonized by means of electricity it has been found to be quite uninjurious. Mr. P. de Puyt recently made some very interesting and instructive compilations regarding this matter, and urges very strongly the use of ozonized air, not only as a destroyer of germs in hospitals, lazarettos, schools, public houses, and other places, but also as a preventive in the case of a threatened epidemic. Eleven to twelve centigrammes per litre of air, which is easily produced by electrical means, and was formerly claimed to be a dangerously large quantity, he says has been found to be perfectly harmless even for infants, if made by electrical means. He also compiled the following interesting figures: During the month of July, 1884, while the cholera epidemic was at its worst in Marseilles, the mean quantity of ozone in the air was .86 as compared to 2.17 during 1883. In Paris even greater difference was found. During the maximum period of the epidemic in November, 1884, it was .44 as compared to 1.82 for the same period in 1883. Moreover, during the two weeks when the mortality was greatest the amount of ozone in the air was as low as .27 as compared to 2.0 for the same period in 1883. Furthermore, during several days when the air was charged electrically, more than was usual, the epidemic was found to diminish in its severity. Such coincidences are certainly very striking and warrant the most careful attention and study on the part of physicians and boards of health. There is time now before the threatened cholera epidemic in this country next summer to institute experiments and make preparation.

Volatilizing Quartz.

Dr. Segar, a German chemist, reports the following trial at volatilizing quartz: The furnace employed was what is known as the Deville pattern, and consisted of a single cylindrical sheet-iron case lined with dead-hurnt magnesite, having an internal cavity of about 5 inches in diameter and 11 inches high. The magnesite lining only extended about two-thirds the length of the cylindrical casing, which was divided at that point by a perforated iron plate, forming the floor of the furnace proper, and supporting the crucible. Below this division was the air-chamber, into which a blast was injected by a side opening, and which served for the preliminary warming of the air before it came in contact with the burning fuel. The crucible was of carbon, and was inclosed in another of magnesite. The fuel used was retort carbon, and was kindled by a few fragments of burning charcoal. The quantity of the former used was 4 kilogrammes, which is certainly a very moderate expenditure. After the experiment it was found that the quartz had undergone fusion, to judge by its appearance, and was noticeably smaller. When weighed it was found to have been reduced to the extent of over 40 per cent, the total mass taken being about 2.5 grammes, and the quantity that had disappeared amounting to 1.1 gramme. That this was in no sense due to accident was proved hy repeating the experiment with another piece of quartz, with a precisely similar result. The comparative constancy of the loss might lead to the supposition that there was some limiting factor in the volatilization, but a second heating of the same testpiece caused a further loss of about 15 per cent on the original weight, and on repeating the heating twice the piece of quartz vanished altogether. It was observed in the course of the experiments that when the quartz was cooled rapidly it had an opaque porcelain-like aspect, while when the cooling took place gradually the testpiece was perfectly transparent.

Structure of the Eye.

That the structure of the eye suggests comparison with a photographic camera is an exceedingly trite observation. The "sensitiveness," as it were, of the retinal "plate" is determined, other things being equal, by what is commonly called acuteness of vision. And it may he remarked, in this connection, that there must be a definite "length of exposure" necessary for the impressment of the retinal image upon the mind. The true optical exposure may, of course, be an exceedingly short one, but there is the retinal—probably retinal, but possibly, in part, cerebral—persistence of action analogous to phosphorescence, to be reckoned with, and we should like to know to what extent the effect of this upon the brain is cumulative.

Every one knows hy experience that it is impossible for the mind to obtain a passing glimpse even of one out of a train of very rapidly successive images upon the retina. But it is also known, as we have just remarked, that a most exceedingly short retinal exposure is sufficient, provided that the subsequent "persistence" is not interfered with. A simple experiment to estimate the relative importance of optical exposure and of "persistence," in regard to the production of cerebral action, would he to suddenly extinguish the light while observing a zoetropic succession of images.

It is complained, and we think with reason, that the properties of the retina, regarded as a photographic surface, have not been sufficiently investigated, and that the records of such experiments, as have been tried, are not very accessible. The question whether the excitation, active or merely persistent, of one color sense is favorable or otherwise to the sensitiveness of the other color senses, has been recently asked. So, too, the question how the period of persistence varies with the quantity and quality of light; what facts can be discovered by photographic retinoscopy; whether problems relating to the color senses, and the extent to which "persistence" is accompanied by surface phosphorescence, could not be most accurately determined by photographing retinal images? The suggestion to study the eye photographically is, in our opinion, worthy of attention. Actinic illumination or images would have the advantage of not irritating the eye or causing contraction of the pupil. The only doubt we entertain is as to the sufficient transparency to actinism of the substance of the eye.—Optician.

How the Lucifer Match was Invented.

It is not generally known that it is to Isaac Holden, M. P., that we owe the invention of the lucifer match. The discovery was, he has told us himself, the result of a happy thought. In the morning, I used to get up at four o'clock in order to pursue my studies, and I used at that time the flint and steel, in the use of which I found very great inconvenience. Of course I knew, as other chemists did, the explosive material that was necessary in order to produce instantaneous light, but it was very difficult to obtain a light on wood by that explosive material, and the idea occurred to me to put sulphur under the explosive mixture. I did that and showed it in my next lecture on chemistry, a course of which I was delivering at a large academy. There was, said Mr. Holden, a young man in the room, whose father was a chemist in London, and he immediately wrote to his father about it, and shortly afterward lucifer matches were issued to the world. I believe that was the first occasion that we had the lucifer match. I was urged to go and take out a patent immediately, but I thought it was so small a matter and it cost me so little labor that I did not think it proper to go and get a patent, otherwise I have no doubt it would have been very profitable.—Pall Mall Gazette.

LIEBER'S ASSAYER'S GUIDE.

A New, Revised and Enlarged Edition of a very popular book.

JUST READY.

Assaye 'a Guide; or Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber, Late Oenologist to the State of Mississippi. A new, revised and enlarged edition. Illustrated by numerous engravings.

In one volume, 12mo, 283 pages, price $1.50 by mail, free of postage to any address in the world.

CONTENTS: Introduction. I. Description of the Implements and Utensils used in the Course of Assays by Heat. II. Re-agents used in Assaying. III. Assay of Silver Ores by Heat Cupellation. IV. A Table to Rectify the Loss Incurred during the Silver Assay. V. Gay-Lussac's Process for Assaying Silver Alloys. VI. Assay of Native Silver Ores. VII. Assay of Gold Ores by Heat. VIII. Assay of Gold Ores by Amalgamation. IX. Assay of Gold by Washing. X. Assay of Gold by Panning. XI. Assay of Gold by Combined Dry and Wet Methods. XII. Assay of Gold Ores by a Wet Process. XIII. Assay of Silver Coins, or Alloys of Silver and Copper. XIV. Assay of Gold Coins, or Alloys Containing Gold, Silver and Copper. XV. To find the Proportion of Gold in a Mixture of Gold and Quartz by Calculation. XVI. Assay of Platinum Ores. XVII. Assay of Copper Ores—German and Hungarian Methods. XVIII. Assay of Copper Ores—English Method. XIX. Wet Assay of Copper. XX. Electrolytic Determination of Copper. XXI. Assay of Lead Ores. XXII. Assay of Lead Ores by Heat. XXIII. Assay of Lead Ores by a Wet Process. XXIV. Gravimetric Analysis of Lead. XXV. Assay of Iron Ores by Heat. XXVI. Fuchs's Process for Iron Ores and Iron. XXVII. Swedish Assay of Iron Ores. XXVIII. Assay of Quicksilver Ores. XXIX. Dry Assay of Tin Ores. XXX. Assay of Sulphurets in Ores. XXXI. Mode of Testing the Calorific Power of Coal and Other Fuels. Index.

☞ *Descriptive circular giving the full Table of Contents of the above book sent free to anyone who will furnish us with his address.*

☞ *A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts sent free and free of postage to any one in any part of the world who will furnish us with his address.*

NEW DISCOVERY

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD OOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. ORO. OOW, Technical M'g'r. and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec.'y; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

TRADE MARK.

DENVER WORKS: On the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

(MACARTHUR-FORREST PROCESS)

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Puzzler Gold Mining and Milling Co., Boulder Co., Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co., Cal.; The Shasta Gold Ex. Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; Champie's Mines, Humbug District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mine owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tuns especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process is the so-called refractory gold ores, pyrites, hematites, manganese and tellurium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,
P. O. Box 986. Gen Mgr and Secretary.

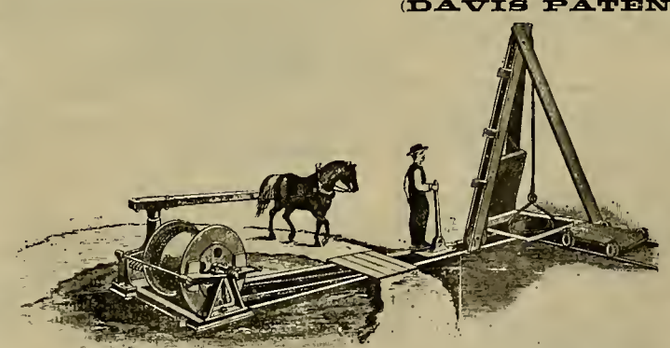
BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

RUPTURE,

PILES and all Rectal Diseases POSITIVELY CURED, in from 30 to 60 days, WITHOUT OPERATION OR DETENTION FROM BUSINESS. Also ALL NERVOUS, SKIN, BLOOD and CHRONIC DISEASES OF BOTH SEXES. STRICTURE AND URINARY TROUBLES CURED. No charge unless cure is effected. Consultation free. Call or address for pamphlet, DRS. PORTERFIELD & LOSEY, 833 Market Street, San Francisco, Cal.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, San Francisco.

Electricity.

History of Electric Street Railways.

The history of electric street railways for the last five years is that of almost unequaled development. The figures showing the growth of the system are interesting. At the close of last year there were in this country 10 599 miles of street railway, with 55,877 cars; 4661 miles were electric. The total of horse, cable and electric cars had increased during the year 3826 cars. Of this number 3300 were propelled by electricity. There were at the end of the year seven times as many miles of electric roads as of cable, and almost twice as many electric cars as there were cable cars. There were at the end of the year something over 400 electric roads in operation in America. Last March it was estimated that of the 16 cities in the United States having over 200,000 inhabitants, 14, or 87 per cent, were equipped with electric roads. Of the 42 cities having between 50,000 and 200 000 inhabitants, 41, or 97½ per cent, had electric roads. Of the remaining 391 cities with a population of over 8000, it is said that there are not a score that have not electric roads, or are not preparing to introduce the system. Since March every one of the larger cities referred to as the exceptions in the above percentages has fallen into line with the formal approval of this comparatively new method of rapid transit. The investment to date is said to reach over $100,000,000.

In spite of this very general adoption of the electric system of transit throughout the country, the advocates of the trolley are obliged to confess that there is only one road in operation—that in Washington—which is properly equipped. In large cities, they say, one condition should be insisted upon when franchises are granted by the authorities, and that, if this condition is complied with, much of the objection to an overhead system would disappear. The company holding the franchise should be compelled to make the construction of the very best. It is declared that the only overhead wire necessary is the contact wire, which need not be more than one third of an inch in diameter; that the main conductors and feeders should be put underground, in proper conduits. In broad streets, where the tracks occupy only a small portion of the street, and are near together, a line of poles, ornamental in design, as is the case in Washington, and not less than 150 feet apart, and with arms projecting on either side, could follow the center of the street, and could be utilized for electric lighting.

But, as the roads are usually constructed, the popular objection to the overhead system is by no means without reason, since it is dangerous to life and property, and an eye-sore which is only equaled by the elevated road structures in New York City. Corporations are proverbially "soulless," and when they see an opportunity of cutting down their operating expenses from 30 to 50 per cent, they are not likely to develop sufficient conscience to resist the temptation, so long as they are granted the privileges which they ask or demand without having the slightest restrictions placed upon their actions.—*Harper's Weekly.*

SEARCH LIGHT.—The search light to be used at the World's Fair is a great thing. It is perched on the tower of the Transportation building, and is the largest and strongest one in the world. It was made at Nuremberg, Germany. The great magnifying glass, through which the rays are thrown, is four feet in diameter. The direct power of the light is 15,000 candles without any glass. With the big glass, however, the power is magnified to 160 000,000 candle power. The carbons used in the radiator are 12 inches long and one and one-fourth in diameter. They are fastened inside the lamp merely with two upright pieces of steel. The lamp itself is operated on a sort of carriage, something after the manner of a Maxim gun. It can be turned in any direction, and can be tilted so that the ray will ascend straight up. When the full power of the light was turned on, the city of Chicago could be viewed distinctly, though the night was anything but clear. Prof. Tischendoerfer claims that on a perfectly clear night Michigan City, across the lake, would be perfectly visible. He also claims that on such a night the rays from the lamp could be seen by persons 60 miles away.

ELECTRIC RAILWAYS.—As a matter of statistics, it would appear that electricity is running about 500 street railways in the United States and Canada, a gain of nearly 200 in two years, and fully equal to half of the total street railway system of America. The investment in these roads has passed the $200,000,000 mark, but gives no sign of falling off to a lower rate of increase, for it was only in February, 1891, that the investment was estimated at $50,000,000. These roads are operating at least 12,000 cars, or two to every mile of track. These are wonderful figures of growth since 1887, when the first American electric railway statistics could present only the slim total of 13 roads, some of which were in reality mere experimental stretches of track with but a couple of cars on them.

Electric Wire Regulations in Paris.

The new regulations issued by the municipality of Paris, governing the laying of wires of private electric companies, entirely prohibit, says the *Engineering News*, the placing of such wires in sewers or other underground conduits located between the curbs, and demand the laying of such wires under the sidewalks. The materials used in the conduits must be approved by the proper municipal officers, who are also to specify the position, exterior diameter and required depth of the conduits. The most favorable positions, near the surface of the streets, are reserved for the municipal electric-light conduits. In order to avoid crossing streets to make house connections, a conduit must be carried under the sidewalk on both sides of the street except in very narrow streets. Whenever a conduit crosses a street, it is to be made accessible by a manhole on one side. In very important thoroughfares each side must be furnished with a manhole. If several companies are laying wires in the same street, a common conduit must be employed, the accruing costs to be shared equally between them.

Electric wires of private companies are not to be carried closer than 3.28 feet to the front walls of houses, which space is to be reserved for the laying of municipal wires. The connections are to be carried in conduits of smaller diameter to the limits of the house. Other branches from the conduits and transformers are to be placed outside the street.

The application for a permit for laying electric wires must be accompanied by detailed plans, for the preparation of which the municipal records and plans of sewers, water conduits, etc., may be consulted. The general plan, drawn to a scale of 1·1000, must show the proposed conduits, with house connections and the number of lamps. The amount of power to be supplied, the position and material of the cables and the size and material of the proposed conduits must be specified. The details must be shown on a scale of 1 in 20 to 1 in 50. Before the pavement is disturbed, the company must pay the city for the proper relaying of the pavement at the following rates per sq. meter: Macadam, $0.56; asphalt, $3.00; wood, $3 80; flagging, $0.95.

Foundations are charged extra at $0.75 per sq. m. for sand and $1.50 for concrete. Curbing is charged at $1.29 per lin. m. (39 cts. per ft.)

TANNING.—The recent application of electricity to tanning in France has resulted in reducing the time of tanning oxhide from 16 to 18 months in pit tanning, and from five to six months in liquor tanning, to 96 hours in both cases, and also does away with continuous hand labor and the disagreeable odor so characteristic of tanneries. Electricity seems in some unaccountable way to accelerate the absorption of the tannin by the hide. The invention without doubt marks one of the most important advances in technology made in many years.

JAPAN is making rapid progress in various lines, and the natural ingenuity of the people is making itself felt even in the electric field. A Japanese has invented an electrical device for recording the votes cast by the members of the native parliament. Each member has a push button and a wire locked with his own key. An electric current releases a red ball, according to contact, in two directions, and when the names are noted the balls are run into rows of 10 and counted up. By an ingenious electrical device the balls are then sent back to their places.

GEORGE WESTINGHOUSE sets the cost of a powerful passenger locomotive of 1200 horsepower at $10,000. To do the same work by electricity would require a 1600-horsepower steam plant and electrical apparatus costing $81,000. It is easy to know where he stands on the question of abandoning the iron for the copper horse on our long trunk roads.

Manufacture of Alum in India.

In a recent issue of the Indian Engineer attention is drawn to the manufacture of alum at Kalabagh, on the Indus, at the westernend of the salt range in the Punjab. The works are owned and superintended by a native khan, and as the expenses are small the profits are very considerable. The process of manufacture is divided into five stages: (a), burning the shale; (b), extracting the soluble matter from the burnt shale; (c), boiling it with salts of soda and potassium; (d), crystallizing the impure alum; (e), heating in earthen pots and recrystallizing. In the first stage the black alum shales, composed of clay and iron pyrites, are brought by coolies to the works, where they are broken up into lumps about five inches square.

These lumps and brushwood are placed in alternate layers of about one foot thick, and when the heap is about 15 feet high it is ignited from below. As the pile burns and sinks down, more layers of brushwood and shale are added. After burning for about six months, the mass is allowed to become cold. The shale has become a bright red color, due to the oxidation of the iron, and is very friable. In the next stage the burnt clay is thrown into square earthen vats about 10 feet long and two feet deep. Water is then slowly added until its level is nearly up to that of the shale. The soaked portion of the shale is raked down a little at a time into that part of the vat containing the water, with which it is thoroughly mixed; it is afterward taken out with a perforated shovel.

The water containing a soluble part of the burnt shale is, after a time drawn off into a similar vat, and any red solid suspended matter is allowed to settle. It is afterward drawn off into a shallow circular vat about 10 feet diameter, made of plates of sheet iron riveted together. The solution is then boiled with an impure sodium and potassium salt called *jamsan*, obtained from *reh*—the sodium sulphate and carbonate efflorescence so commonly found in the Punjab. The liquid, after further boiling is decanted and allowed to crystallize in vats of sun-dried clay. The crystals are about ½-inch diameter, and of a light grayish-green color.

These are stacked and allowed to drain for 10 days. After this they are put into earthen pots holding about 1½ maunds (112) pounds) with a little water, and are heated in a kiln or oven The earthen pots are broken open when cool, and large crystals of alum, some six inches long, are found inside. This is the form in which it is sold in the bazars. These works produce some 3000 maunds per annum. From three to four seers of alum (seven to nine pounds) is about the quantity obtained from each maund (75) pounds) of black shale.

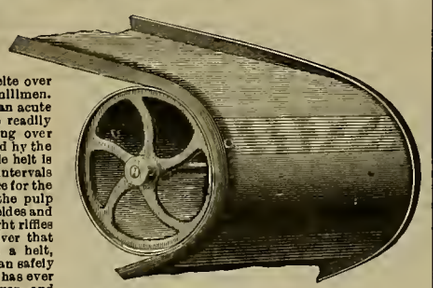
GEO. E. WOODBURY,
BEST CONCENTRATOR FOR ORES OF ALL KINDS.

THE BLASDEL CONCENTRATING BELT COMPANY.



We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to squalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Useful Information.

Facts Concerning Dynamite.

Very few people have a correct idea of what dynamite is, of what it is made, and the uses to which it is put. To the French belongs the honor of its discovery and its practical use. Nitroglycerin is the force of all high explosives. Dynamite is the name most usually given to these explosives, though other names are sometimes used.

Dynamite is simply nitroglycerin mixed with various ingredients. Nitroglycerin is made by mixing sulphuric and nitric acid with sweet glycerin, the same that is used by the ladies to prevent chapped hands. Mixing the acids and glycerine is where the danger lies in the making of nitroglycerin. The mixing tank, or agitator, as it is called by dynamite makers, is a large steel tank, filled inside with many coils of lead pipe, through which, while the mixing is in progress, a constant flow of ice water is maintained. This flow of ice water is used to keep the temperature of the mix below 85 degrees, as above that point it would explode, aod a hole in the ground would mark where the factory had been. The nitroglycerin is stored in large earthenware tanks, which are usually sunk in the ground to guard against blows or severe concussion.

The other ingredients for making dynamite are: nitrate of soda, which is found only in Chili, carbonate of magnesia, and wood pulp. Dynamite is put in paper shells, usually one and quarter inches in diameter and eight inches in length, and weighs about one-half pound to each shell or cartridge. It has largely taken the place of black powder for blasting, as it is many hundreds of times stronger, and consequently more economical. It is used in mining all kinds of ores, coal and rock, submarine blasting and railroad-building. Without its aid many railroads, especially those crossing the Rocky mountains, could not have been constructed, and Hell Gate in New York Harbor could not have been destroyed.

Dynamite will not explode from any ordinary fall or jar; it will burn without explosion and freezes at 42 degrees, 10 degrees above ordinary freezing point. The bomb of the anarchist is made of metal or glass and filled with pure nitroglycerin, arranged so as to explode by severe contact with any hard object. These bombs are, of course, never made by a reputable dynamite factory. Five or six millions of dollars are invested in the manufacture of dynamite in the United States, and its use is constantly on the increase. The fumes of nitroglycerin produce intense headache, which can be cured by taking a very small dose of it internally.—Exchange.

BOXWOOD. — Boxwood, imported into Eogland from Turkey and Asia Minor, and used by engravers and for the manufacture of rules, mathematical instruments, shuttles, etc., has risen in price so rapidly, owing to the exhaustion of the eastern forests, that dealers are searching in every direction for a substitute. For engravers' use no substitute has as yet been found, but for the manufacture of shuttles, which consumes vast quantities of timber in the weaving districts of England, American dogwood and persimmon are beginning to find considerable favor, and the trade in these woods, if fostered, bids fair to assume considerable proportions. The American consul at Manchester, Mr. Grinnell, writes as follows concerning it: "The best wood from the United States to supersede boxwood is dogwood (cornel, as it is more commonly called here), which, owing to its relatively moderate price ($18 to $20 per ton), may, it is thought, if more carefully selected, ultimately replace the more expensive boxwood for the purpose in question. The pieces should not be less than five or six inches in diameter, in length as long as convenient, say 12 feet, to be cut here into 13 or 14-inch lengths for working up. Of course, the wood should not be split, and the greater the diameter the better, if the heart is sound and it is free from other fault. It is again urged upon the shipper, as vital to the interests of himself and the trade, to reject all pieces doubtful or bad."

SILVERING GLASS.—The following method of silvering glass is said to be eminently successful, and is largely adopted in many manufactories: "There are two solutions used in the process, known respectively as the reducing and silvering solutioos. To prepare the first, dissolve 12 grains of Rochelle salts in 12 ounces of water, and boil; then add, while boiling, 16 grains of nitrate of silver dissolved in an ounce of water, and continue the boiling for 10 minutes more, after which add water sufficient to make 12 ounces. To prepare the second, dissolve 1 ounce of nitrate of silver in 10 ounces of water; then add liquor ammonia until the brown precipitate is nearly, but not quite, all dissolved; then add one ounce of alcohol and sufficient water to make 12 ounces. Distilled water should be used in making these solutions. When both preparations are ready take equal parts of both solutions and mix them thoroughly; then lay the glass face down on the top of the mixture while still wet, the glass being carefully cleaned with soda and well rinsed with clean water. About two drachms of each solution will be sufficient to silver a plate two inches square. The dish in which the silvering is done should only be a little larger than the plate. It is better to let the solution stand and settle two or three days before being used."

FIRE-PROOFING MATERIAL.—The recent fire test of a fireproof building at Chicago is a most valuable lesson to engineers and contractors engaged on this class of work, as well as to the manufacturers of the fireproofing material used for covering the metal columns and beams of the skeleton framing of these steel buildings. The fire was a hot one, but very little injury was done to the steel structural work of the building, except where the fire-proofing had not yet been put on, or where it had been put on in so faulty a manner that its fastenings burned away, allowing the fireproof covering to fall off. The owners of the building were wise in having the structure examined by experienced engineers, and the engineers' report shows clearly the effect of the fire. The report also shows the very high degree of safety of such a building when properly constructed. When fireproof material is used to protect any part of a building, it is of the utmost importance that it should be so secured that it canoot be burned off, or easily knocked off by any light falling material. One view of the case is that the fire-proofing in this case was ruined by water being unnecessarily poured oo it when thoroughly heated and when the fire had already done all the damage possible. This is scarcely a fair view, however, as if properly put on, this fire-proofing would have been secure; and in any case the first duty of the firemen is to put out a fire and prevent it from spreading, and they cannot and should not be expected to stop and find out whether the fire has completed its work before they begin to try and extinguish it. There might have been persons in the building, and it was far better to risk damage to the structure than to risk human life. In future work of this kind, the absolute necessity of so securing the fire-proofing material that it will stay in place, and fulfill its purpose when subjected to test, sbould be recognized and insisted upon very strongly.

SPONTANEOUS COMBUSTION. — Among the results brought to light through chemical investigatioos of the sources of spontaneous combustion, says the *United States Miller*, is the fact that sawdust should never be used to collect drippings or leakages. Dry vegetable or animal oil is found to inevitably take fire when saturating cotton waste at 180 degrees Fahrenheit, and spontaneous combustion occurs more quickly when the cotton is soaked witb its own weight of oil. Danger is involved in patent "driers," from leakage into sawdust, etc.; oily waste of any kind, or waste cloths of silk or cotton, saturated with oil, varnish or turpentine, also linseed-oil drippings into a sponge; glycerio or oil of any kind leaking into sawdust; bituminous coal in large heaps of pit coal, hastened by wet, and especially when pyrites are present in the coal—the larger, the greater the liability. Oil on flour, or water on flour, is productive of spontaneous combustion. In fact, all organic structures, being largely composed of carbon and hydrogen, are readily excited, because of the affioity of the hydrogen for oxygen.

DEMAND FOR SEAMLESS TUBES.—In regard to the rapid growth in the use of seamless steel tubes, Birmingham is the chief center for the manufacture of seamless steel tubes in variety, the increase in the industry being characterized as remarkable. Bicycle makers and engineers are the principal consumers in this line; indeed, whatever metal tubing is required that has to withstand an exceptionally great strain, and where the employment of steel is practicable for the purpose, the seamless tube is increasing in request. It is claimed to have added materially to the efficiency and durableness of hydraulic machinery. A ¾ inch tube with a core of ½ inch can be drawn in steel to withstand a pressure of 1000 pounds on the square inch, and it has now for some time been largely and satisfactorily used for boilers instead of copper-tubing; the cost is found to be considerably less, while its durability is as great, and in the case of high-class steel, its reliability will compare quite favorably with the ordinary copper tube.—Machinery

By-Products in the Hennin Gas Process.

The Springfield (Ill.) Iron Company reports, says the *American Manufacturer*, that the Hennin gas process, which has now been in practical operation in its works for more than a year, furnishing all the fuel gas in its No. 1 bar mill containing its 12 and 16-inch merchant trains, is still not only working to its complete satisfaction, but improves almost daily. The plant consists of five wrought iron shell circular gas producers, somewhat resembling the Wellman producers, in which the gas, tar and ammonia is generated. These products of distillation are removed from the producers by a rotary exhauster and passed through a series of washers, condensers and scrubbers, which remove the ammonia and tar from the gas. The gas as sent from the works is therefore entirely fixed and non-condensible, and is almost absolutely free from sulphur and other impurities. It is found that a very large saving results from extracting the ammonia and tar from the gas, and the gas made is of very high efficiency and of great value as fuel, averaging about 60 per cent combustible matter against 25 to 30 per cent combustible in ordinary producer gas. The ammonia is secured in water as ammoniacal liquor, the same as in ordinary illuminating gas works. The Springfield Iron Company has erected a very complete plant for the distillation of the liquor, which is the process by which the ammonia is finally secured. The distilling plant consists of a very large Gruneberg-Blum continuous still, and two saturators which have a capacity of 2500 to 3000 pounds of sulphate of ammonia in 24 hours. At present all the output of ammonia is made into sulphate, but the plant is prepared with some very slight changes in the apparatus to make either other salts of ammonia or condense the ammonia into concentrated liquor of any strength. The company has recently added to this department a very complete plant for the distillation of the coal tar made and its manufacture into pitch.

CARRYING CAPACITY OF WIRES.—The safe carrying capacity of a wire is that current which it will convey without becoming painfully warm when grasped in the closed hand. In reference to this it must be remembered that this test cannot safely be made with the wires carrying currents for arc lights, and it is intended to be applied only with reference to the conductors of incandescent lights. These may be handled without risk; but the conductors of the arc lights, where, as is usually the case, there are a number in series, a severe shock may be experienced on touching the wire, and if a ground connection existed by chance elsewhere, and some other conditions were present by which the full force of the current passed through the body, this shock might be fatal.—Electrical Age.

NOTICE OF ASSESSMENT.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the 22d day of November 1892, an assessment (No. 70) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporatio , payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

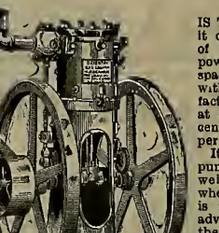
Any stock upon which this assessment shall remain unpaid on the TWENTY-EIGHTH DAY OF DECEMBER, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of January, 1893, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Trustees.

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

THE ORIENTAL GAS ENGINE



IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

DEWEY & CO.'S

Scientific Press  Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

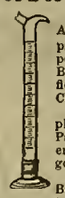
63 & 65 First St., cor. Mission, San Francisco.



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
M.C.C. BATTERSEA
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Dennistoun's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION —JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

THE RUSSELL PROCESS.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

PIONEER.—Amador *Ledger*, Dec. 16: Messrs. Fisher and Shay, who have charge of the Pioneer mine, in the district of that name, have struck a good-sized lead of paying ore.

THE LONE STAR.—Flattering reports are being received from the Lone Star, or Hnrley gold mine, on the Mokelumne river, near West Point. The owners have been going down in the granite, and, contrary to the generally accepted theory, have struck a vein of quartz which pays from $18 to $40 per ton in free-milling gold.

PINNEVITTA.—The Pinnevitta, also in the Pioneer district, belongs to Scott & Stirnaman, and is worked from a tunnel. The ore from this is very rebellious, and has to be shipped to Selby's Works to be smelted. This process is very expensive, it is true; but as the ore goes close to $800 per ton, it pays pretty well for all that.

THE THEUCROFT.—In the Theucroft mine, formerly the property of the Reichlings, but now being worked by Mr. Marchaund, a 16-foot ledge was encountered recently, which looks as though it would turn out very rich. The ledge was struck in a crosscut to the west from the main tunnel. Mr. Marchaund crosscut to the west contrary to the advice of many of those who had mined in Pioneer district, where the claim is located, but the result shows that his judgment was correct.

AMADOR VIEW.—James & Stirnaman, the owners of the Amador View, where they made the rich strike some time ago, succeeded in demonstrating the fact that the Mexican miners did not secure all the gold in the mines they worked. Their mine is a continuation of one of the old Mexican shafts, and is not down more than 40 feet from the surface. They have been using a windlass to do their hoisting, but will soon put in a whim. They have a five-stamp mill working on $70 ore in free-milling gold.

SUTTAA CREEK.—Cor. Amador *Ledger*, Dec. 16: Sinking in the Wildman mine, which has been in contemplation for some time, will be commenced in a few days. Mechanics from Knight & Co.'s foundry have been engaged for a few days in placing a gate in position in the pipe, so that in case the main pipe should burst again the water can be turned from the mill to the hoist, thus averting the necessity of all hands who might be in the mine climbing by ladder to the surface. One hundred feet, and possibly two hundred, will be sunk. It is uncertain yet just when sinking will be commenced in the South Eureka—most likely, however, not until spring, owing to the amount of water they have to contend with at present. Drifting is still being pushed on the ledge in the south drift, which improves as developments go on. Considerable ore of a paying quality is being taken out at the Hector from the surface drifts, and preparations are being made to drop the stamps again in a few days. At the Belmont there is not a great deal being done just at this time, on account of the inadequacy of the machinery to cope with the water they have to contend with.

PLYMOUTH.—Cor. Amador *Ledger*, Dec. 16: Bay State stock has taken a sudden rise—a fact which has astonished the most sanguine shareholders. Judge Richardson, I am told on reliable authority, bought, last week, an indefinite number of shares at 45 cents—an advance of 20 cents over former transfers. Shareholders are taking advantage of this sale and asking an increased price for their stock. I heard to-day that a few shares could he purchased for $1, but inquiry failed to locate the stock. I cannot attribute this sudden rise to any other cause than that all the shareowners in this mine know exactly what is in sight, and that in a few days the new machinery will be ready to start up, and that when 40 stamps begin to run on $8-rock the results are bound to greatly increase the value of the stock. The new machinery is daily arriving and being placed in position as rapidly as the best experts can do it, and we expect to see all the water out of the mine very shortly and a large force of men at work. The Wilds & Wheeler Company is bending all its energies to the completion of its new mill, and if the weather permits, A. M. Vaughn, the celebrated millwright, will soon have a first-class five-stamp mill from Knight & Co.'s foundry at Sutter Creek pounding away on $80 ore. This I consider one of the richest discoveries made in Amador county for years. The vein found on the surface was but about 18 inches; at a depth of 50 feet it is 6 feet wide and at the bottom of the shaft it is now fully 12 feet. From the rock milled from the shaft, and from assays carefully made of the rock all the way from the top, it is estimated that the ore will yield at least $80 per ton.

THE BAUDEN.—Dr. Boysou's shaft on the Bauden purchase, under the able management of W. F. Jones Jr., is going down finely. They have reached a depth of 50 feet, but as the shaft was started in the footwall, it will not cut the ledge short of 100 feet. It is generally thought by old-time miners here that this is going to prove a valuable property, the surface rock having yielded largely in free gold. Dr. Boyson is expecting daily to begin operations on an extensive scale on the Shearer plant, situated just south of the Bay State. I understand from Mr. Jones, the superintendent of the Osceola, that work on this new development is progressing satisfactorily, and that the San Francisco owners are highly pleased with the outlook. All the idle men around the town have been engaged for the past two weeks in doing assessment work on the various locations in this vicinity and in repairing the damage done by the late storm on the system of ditches that supplies this place with water.

Butte.

THE TOLLES MINE.—Oroville *Mercury*, Dec. 16: The Tolles quartz mine, situated near Hnrleton, which was the property of J. S. Tolles, has been sold. The purchasers are L. C. Jacobs, J. D. Mowser, D. S. O'Callaghan and E. W. McCauley. It is the intention of these gentlemen to at once commence development work upon the property and a team loaded with supplies and tools left for the mine this morning. Mr. McCauley will be superintendent. The ore assays well and carries a high percentage of sulphurets.

THE PHŒNIX MINE.—Oroville *Mercury*, Dec. 14: Dr. T. W. Serviss, Dr. F. W. Gibson and George C. Colman have formed a copartnership and yesterday completed the purchase of the Phœnix quartz mine, near Hurleton. Considerable development work has already been done, and it is a ledge noted for its free gold, while the assays of its sulphurets, of which it carries a heavy percentage, run very high. It is the intention of the company to at once put in a mill and concentrators for the purpose of working the ore. Messrs. Gibson and Colman went to San Francisco this morning to complete the purchase of machinery. Work will at once be commenced on the mill and mine.

Nevada.

FORTUNA MINA.—Grass Valley *Telegraph*, Dec. 16: We learn that the Fortuna mine, which is located near Nevada City, is about to resume operations. The mine was at one time operated by the Hon. H. F. Page.

THE RAOULAR THINO.— Nevada *Transcript*, Dec. 16: At a meeting of the directors of the Champion Mining Co., held on Tuesday last, a dividend of 10 cents a share was declared. This makes the 26th, and there are innnmerable more in sight. The Champion quartz mine is second only to the Idaho.

OPENING IT SYSTEMATICALLY.—Messrs. McKenzie and Wheeler are running a 300-foot bedrock tunnel in the Knickerbocker drift claim just west of town. They are doing the work by contract. It is a valuable property, as evidenced by the development made during the last two years, and the new tunnel will put it on a first-class producing basis.

LOOKING FOR INVESTMANT.—Some four or five gentlemen from below are in this district at the present time looking for mining properties. They have been looking at several of the old unworked mines, and it is rumored that a sale or two of these properties will soon take place.

THA FORTUNA MINE.—Nevada *Transcript*, Dec. 17: It has been rumored here about a dozen times in as many years that work would be resumed on the old Fortuna mine, and we understand that work is now being done there with the intention of reopening the mine. It is generally believed that the mine is a good one. Robinson and others sold it to San Francisco and Eastern parties, and they incorporated under the laws of the State of New York. They sold the stock and it was scattered from Maine to Georgia. Part of the money arising from the sale was expended in doing some work on the property, but not enough to show up the true value of the mine. It was subsequently sold at sheriff's sale and bid in by the late H. F. Page. Since the death of Mr. Page, the property was sold again and bought in by parties residing at Vallejo, and is now owned by them. We learn that arrangements have been made to resume work, but whether by the owners or by parties who have a bond on the property, we are not informed. One thing is certain, that if the mine is ever properly opened up it will prove one of the best properties in this district, as there is a complete network of quartz ledges running through the section where the Fortuna lies. The heaviest gold-bearing rock ever taken out here came from near the surface of the Fortuna.

RUMORAN SALES.—*Transcript*, Dec. 18: It is reported upon what seems to be good authority, that negotiations are now going on for the sale of three quartz and two gravel mines in this vicinity. No work of any consequence has been done on any of the mines referred to, with possibly one exception, for a great many years. If started up, and it is confidently believed they will be very soon, it will make a big difference in the business of this city, as a very large number of additional men will be employed, and the amount of money in circulation thereby greatly increased. A gentleman who is well posted upon what is going on, told the *Transcript* reporter to-day that he was confident that from four to six hundred men, in addition to those already employed here, would be given work within six months from this time. He informs us that the Fountain Head and Cold Spring gravel mines will be consolidated and worked by San Francisco capitalists, the old Fortuna, Sneath & Clay, the Sharp and two or three other mines upon which little or no work has been done during the past 15 or 20 years, will be in full blast. This certainly is very encouraging news to our people, and all will anxiously await its realization.

NORTH BLOOMFIELD.—Sacramento *Bee*, Dec. 16: Robert T. Devlin and A. H. Wilhur, counsel and manager of the State Anti-Debris Association, respectively, returned Sunday night from a visit to the North Bloomfield mine, situated about 14 miles north of Nevada City. They were accompanied to the mine by two civil engineers, and the object of their visit was to make preliminary arrangements for a survey of the mine and the alleged settling reservoirs which have been erected for the purpose of determining the capacity of the reservoirs and the amount of material in the banks capable of removal. This was done to enable the Anti Debris Association to protect itself against any abuse of the modifying order of Judge Gilbert of the United States Circuit Court, allowing hydraulic mining to be resumed in this mine by the erection of restraining works. The North Bloomfield mine is one of the largest not only in California, but in the world. Its system of reservoirs, ditches and pipes represent an outlay of over $3,000,000. This mine has been enjoined by the Circuit Court of the United States, in suits brought by the United States Government to preserve the navigability of the river, and by Edward Woodruff, a property-owner in Marysville, to preserve his lands from injury. Injunctions were issued, and for over two years the mine had lain idle. The company then began the erection of brush dams, and made application to the United States Circuit Court in San Francisco for a modification of the injunction, on the theory that for at least two years they could mine and store the greater part of their debris behind their brush dams. Judge Gilbert of Oregon, who succeeded Judge Sawyer in the trial of the case, made a visit to the mine last summer, in company with the representatives of the two interests, examined the restraining works and modified the injunction by permitting the mine to continue operations. The antidebris people have no faith in these brush dams, and believe that a resumption of mining under this system will be as injurious to valley interests in the future as it has been in the past. But so far as the Federal Courts are concerned, Judge Gilbert believes in their efficiency, and it was for the purpose of gathering accurate information by surveys and cross-sectioning that a visit was made Friday and Saturday of last week by the officers of the Association and civil engineers. Mining has not yet commenced at the North Bloomfield, but they expect to resume mining under Judge Gilbert's decree in the spring.

Shasta.

IGO ITEMS.—*Courier*, Dec. 17: The South Fork Mining Co. is doing some work, but just when they will start up I cannot say. E. L. Ballou is pushing his reduction works to completion, and all hope they will prove a success. Robinson and Son are doing some work on their mines, and W. D. Bull is taking out some very fine ore. The Bully Choop mine has shut down for the winter on account of snow.

Siskiyou.

RIVER CLAIMS.—Yreka *Journal*, Dec. 17: All the claims along the Klamath river, except the Phil Mott and McConnell & Quinne, are still being worked with very good success. In the Centennial a rich pay streak has been found at bedrock of last cut, from which a good supply of dust is realized. The Chinese claim, below Honolulu, pays exceedingly well at one derrick, but the other does not pay very much, hence the Chinese company is not doing quite as well this year as during last season, but the prospects ahead are excellent for big strikes. The Boyle & Co. and Spencer quartz mines on Humbug creek, have been closed down on account of snow, which is about three feet deep on the mountain at present. A couple of men will be kept at each mine to clear the snow from the buildings during snowfalls. Another very rich ledge was discovered accidentally last week by Hunt & Co., while digging a tunnel to drain the shaft at the old ledge, which promises to prove a bonanza in value and extent. This location is owned by a San Francisco company and is under the management of Mr. Hunt, who put up a mill last summer. Louis Scheld has a force of men at work drifting in his placer claim at Greenhorn gulch on Yreka Flats, so as to have a good supply of pay gravel on hand when water is plenty, which seems certain from the large amount of snow on the Humbug range, to be melted when warm rains occur or after the present cold spell is over. Cartwright & Co. have sunk down about 640 feet on their quartz ledge, the Mountain Belle, at North Fork of Humbug, and find high-grade quartz paying from $40 to $60 and over per ton, with the ledge varying from six inches to four feet in width. They are on the sunny side of the mountain, where the snow melts rapidly under the heat of the sun, which permits working at all times, there being less than 18 inches on the ground around their claim at present.

Tuolumne.

STRIKE.—Tuolumne *Independent*, Dec. 17: A rich strike has been made in the Gloster Cook and Ryan mine, on Spring Gulch. A. W. Moulton, who has the mine bonded, while prospecting up above where he has been working the vein—some 400 feet above the tunnel—struck a prospect, and in opening it up, uncovered some of the richest rock ever found in the mine. It will average in free gold $100 per ton and the sulphurets will go over $400.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA. — Virginia *Chronicle*, Dec. 17: All ore extraction has been suspended for the last five days of this week. At a late hour on Saturday night, Dec. 10th, fire broke out near the south end of the mine under the 1650 level old stopes. From near the point where the fire was seen there is an upraise connection with our 1500 level stopes. The gas and smoke escaped up through this opening and caused our men on that level to make a hasty retreat north through our drift openings to the Ophir shaft. The Con. California & Virginia old shaft is upcast, or outlet for air. The C. & C. shaft is downcast, or inlet for air. Therefore, to control our fire troubles as speedily as possible, it was necessary to bulkhead our 1650 level, southwest drift and the openings leading to the 1750 and 1800 levels. Temporarily we are entirely shut out by brick and cement bulkheads from the two last-named levels. Our 1650 level northwest drift leading to our 1600 level, thence to our 1500, is in good order; the air for ventilation is good and free from gas. We have a limited number of men working through all these last-named openings, and expect to resume the extraction of ore from them in a very short time. The gas escaping through the Con. Cal. & Va. shaft is gradually decreasing. Have extracted from the mine during the week 227 tons of ore, which was shipped to the Morgan mill, together with 646 810-2000 tons of ore taken from the ore-bins, the average assay value of which, per car samples, was $23.47 per ton. The average assay value of all the ore worked at that mill during the week, 936 tons, was $21.43 per ton per battery assay. Bullion on hand in our assay office, which will be shipped to the Carson Mint to-morrow night, assay value, $18,-134.73.

OPHIR.—1465 level—The upraise started on the sill floor, on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, has been carried up 8 feet; total height, 38 feet, continuing in porphyry showing lines of quartz.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 22 feet; total length, 395 feet; continuing in a porphyry formation with lines of quartz.

UNION CON.—900 level: The joint Union Con. and Sierra Nevada west drift, has been extended during the week 20 feet; total length west from the joint shaft, 2728 feet. Have passed through a fissure two and one-half feet wide, which was filled with clay and quartz, from which there is a strong flow of water. The face is now in porphyry.

UTAH.—340 level—West crosscut No. 3, from the north drift from west crosscut No. 2, at a point 195 feet in from its mouth, has been extended 17 feet; total length 23 feet. The face of this crosscut is in a porphyry, clay and quartzite formation, showing some water.

SIERRA NEVADA.—West crosscut No. 2, from Kenosha tunnel, started from north drift, 800 feet in, has been advanced 27 feet; total length, 454 feet; face in hard porphyry. The joint Sierra Nevada and Union west drift, 900 level, was advanced 20 feet; total distance west of shaft, 2728 feet. Have passed through a fissure, 2½ feet wide, which was filled with clay and quartz, from which there is a strong flow of water. The face is now in porphyry.

BULLION—West crosscut, 160 feet north of top of upraise, 320 feet south of north line, 1800 level, is out 26 feet; face in soft porphyry. West crosscut, 390 feet south of north line from Ward shaft, 1800 level, is out 90 feet; face in clay and porphyry.

CHOLLAR.—Are repairing north drifts on the 450 and 550 levels, and the main shaft between the 850 and 930 levels. The north drift from the east crosscut, 160 feet south of north line, 930 level, was not advanced any on account of retimbering the east crosscut.

ALPHA.—The joint Alpha and Exchequer east crosscut on north line of Alpha is out 130 feet; face in porphyry.

EXCHEQUER.—The joint Alpha and Exchequer east crosscut on north line of Alpha is out 130 feet; face in porphyry.

WAAN SHAFT.—Joint Alpha and Exchequer east crosscut, on the north line of Alpha, is out 130 feet; face in porphyry. The west crosscut, 300 feet south of north line of Bullion from Ward shaft, 1800 level, is out 90 feet; face in clay and porphyry. During the week, have been grading the connection from the northwest drift on the Ward shaft, 1800 level, with Potosi winze.

POTOSI.—The raise from No. 1 crosscut, 1100 level, is up 90 feet; the south end showing from two to two and one-half feet of ore of good grade. Part of the roof is now in clay and porphyry, which is cutting out the ore. The east drift from Potosi winze station, 1000 level, is out 82 feet; face in soft porphyry and streaks of quartz. During the week have been grading the connection from the northwest drift on the Ward shaft, 1800 level, with Potosi winze. Extracted and sent to the mill the past week 354 tons and 750 pounds of ore from the 550, 930 and 1150 levels; milled during the week, 353 tons; on hand at mill, 70 tons 1900 pounds. Average battery assays, $24.85. Average car sample assays, $29.10. Shipped to Carson Mint, 343¾ pounds of crude bullion.

SILVER HILL.—The north drift on the 160 level has been advanced 9 feet through quartz, the car samples of which average to about $17 in gold. Completed upraise in the south drift from the Justice shaft, 622 level, to the Silver Hill north line, and started a drift from there in a southwesterly direction; formation, hard porphyry.

GOULD & CURRY.—200 level: West crosscut No. 5, started 432 feet from main west drift, has been advanced 17 feet through hard porphyry; total length 177 feet, West crosscut No. 6 from main north drift has been extended seven feet; total length 36 feet; face in porphyry, clay and quartz. On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 20 feet through hard porphyry; total length, 744 feet.

BEST & BELCHER.—200 level—During the past week the northwest drift has been advanced 19 feet; total length, 86 feet; face in porphyry and stringers of quartz. 900 level—Have resumed work in west crosscut No. 2 and advanced same 18 feet through porphyry: total length, 94 feet.

OCCIDENTAL.—The upraise from south drift, 750 level, is up 36 feet; top in low-grade ore. The north drift, 750 level, has been extended 18 feet; face in low-grade ore. Crosscut No. 2 in Zadig drift, Sutro tunnel level, is in 71 feet, and has entered the vein; the material in the face is porphyry with streaks of quartz.

ANDES.—On 420 level north drift from east crosscut No. 1, north, advanced 6 feet; total, 19 feet. This drift is all in quartz.

HALE & NORCROSS.—We continue retimbering main shaft at the 700 level. Main incline—Are

making the necessary repeirs, and ere retimbering a portion of incline between the 1700 and 1800 levels. 1800 level—Advanced No. 1 west crosscut 25 feet; totel lengtb, 239 feet; fece in porphyry with streeks of quertz. West crosscut No. 3 was advanced 22 feet; total length, 175 feet; fece in porphyry and streaks of quartz. Advanced No. 4 west crosscnt 18 feet; total length 28 feet; face in quartz and porphyry.

East Best & Belcher and Noath Gould & Curay.—Started work last Monday, both mines being worked from the Eest Best & Belcher shaft, new hoisting works and new patent windlass.

Tuscarora District.

Navajo.—*Times-Review*, Dec. 16: The stopes above the 350-foot level are looking abont the same.

Belle Isle.—Have started to extend second stope above the 250-foot level southward, where some good ore is showing. No change to report elsewhere.

North Belle Isle.—The stopes above the 400-foot level are yielding a little very good ore. No material change in the stopes from the 300-foot level.

Elko Con.—North drift from the incline shaft extended 10 feet.

ARIZONA.

The Bucyrus Machine.— Prescott *Courier*, Dec. 17: At Stanton, Mr. Rybon visited the pl..cer camp, where he saw the Brobdignegian Bucyrus steam shovel at work, and describes it a most perfect piece of machinery, which works from a regular car which advances on the track as the great shovel clears the way, lifting 2700 pounds of earth and rock at each shovelful and throwing three a minute, handling as much earth as 30 men would each minute. Nothing seems to obstruct the shovel as it attacks the previonsly untouched hillsides and scoops up immense boulders with no hitch or check in the machinery. That these shovels will work wonders in onr placer gold-fields is now settled beyond question. The work now being done is to clear ont a channel for the erection of the amalgamator, and the dirt now being turned over will he the only dirt that the company expects to handle twice. Mr. Fuller, the superintendent, has now about 15 men at work. It has beeu estimated, from very careful prospecting, that this ground will average 35 cents in gold to the cubic yard.

The Oao Bella Mine.— Prescott *Courier*, Dec. 17: The Oro Bella Company will soon erect et the Oro Bella mine, Tiger mining district, near Prescott, one of the newly introduced Crawford quartz mills for the reduction of sulphnret ore to hullion. These mills have been successfully introduced near Hillsborongh, N. M., where they ere now running on sulphuret ores and saving 97 per cent of the gold. The inventor of this mill, Mr. Crawford, styles it "the Crawford mill for the mechanical reduction of gold ores," the priciple of treatment being placed npon mechanical reduction instead of the complicated process now so much written about and so seldom successful. This mill grinds the ore into extremely fine particles, the pulverized mass dropping into a quicksilver bath beneath. "Will reduce daily 100 tons of metalized stone to a 120 mesh at a cost of $100, which incldnes labor, wear and tear and renewals." This means that the ore is crushed to a sufficient fineness to pass through a silk handkerchief, and if there is any gold in it, it must be released from its rebel coating and be within reacb of the quicksilver. This mill, it is claimed, will run with from "500 to 1500 gallons per ton of ore crushed, whereas the ordinary stampmill reqnires not less thau 2000 to 8000 gallons of water per ton." The introduction of this mill by the Oro Bella Co. will be watched with great interest by mining men of this section, and should it prove what is claimed for it, men without gold in their pockets will be very scarce in this section, and a population will rapidly increese to meet the demand of the mill-owners for ore, and mine-owners for men to take the ore ont. There will he no lack of ore.

Hillside.—Prescott *Courier*, Dec. 16: Reports from the Hillside are that the Seven Stars Mining Co. is making preparations for working those splendid properties on a great scale, and costly and substantial improvements are steadily in progress; 2000 cords of wood are piled up near the mine and a lerge force of woodmen is employed adding to it.

Lackawanna.—Arizona *Journal-Miner*, Dec. 14: Phœnix papers announce that A. B. Ellit, an acconnt of whose dream in regard to a mine was published recently in this paper, has gone to the Bradshaw mountains to work the claim of wbich he dreamed. A quantity of ore taken from the claim assayed $642 in gold and $38 in eilver. Relying on his dream, Mr. Ellit is confident that his present visit to the mine will develop ore of a richness nnheard of among the mining men of the the territory. Geo. H. Curry ceme in yesterday from Tonto Besin to secure some additional parts for the machinery which he is erecting on the Lackawauna mine. He seys he expects to have the mill running within 15 days, the recent storm having furnished them with an ahundance of water. The mine is looking splendid, and great hopes are entertained for a successful and profitable run of the mill, every indication at present pointing to that end.

Mammoth.— Florence *Tribune*, Dec. 14: Work on the Mammoth mine, Cesa Grande district, is being pushed forward vigorously. The mine is owned hy Johnson & Hadley, who are extensive mine-owners in Colorado. Mining is their bnsiness, and, being practical men, they usually meke a success of the mines they take hold of. Mr. Carey is superintendent of the mine. The proprietors have made all arrangements for the erection of a 20-stamp mill as soon as water is ohtained, sinking for which will commence soon. Another producing mine will thus soon be pleced to the credit of Pime county.

Bonded.—Tombstone *Epitaph*, Dec. 19: The Casey mines at Dos Cabezes were bonded yesterdey to a New Mexico syndicate for $95,000. B. S. Coffman of this city, and a mining men named Moore, negotiated the deal. Tbe terms of the bond are not known, but it can be positively stated that the mines will be worked from the start.

BRITISH COLUMBIA.

Will Ship a Caaloan of Oae.— Nelson *Miner*, Dec. 14: The owners of the Mile Point claim. in Ainsworth district, will ship a carload of ore to Great Falls next week. Tbe tunnel is in about 50 feet, 25 feet of the distance in ore, the vein now being fully five feet wide. The ore tbat will be shipped samples 150 onnces to the ton. No mine in the whole lake conntry is so favorably situated for shipping ore, a Siwash and a wheelbarrow easily landing a carload in a few hours at a point where it can be loaded on steamboats.

Smelters Now Pay the Duty.—Formerly the dnty on ores shipped from tbis section to smelters in the United States was paid by the mineowner, the valne being ascertained by the collector of customs at Bonner's Ferry or at Little Dalles. This often caused vexatious delays. Now the smelters give bonds tbat they will make correct returns of the value of all dutiable ores smelted by them, and they pay the duty, charging tbe amount to the shipper of the ore.

IDAHO.

Finds on a Reseavation.— Nelson *Miner*, Dec. 17: Wbite men, who have been secretly prospecting in tbe Lemhi Valley Indian Reservation, in Lemhi connty, Idaho, have discovered some wonderfully fine gold and copper ledges which they are trying to hold until tbe reservation is thrown open for settlement. The redskins, however, are fully cognizant of tbe value of tbe great deposits of mineral, end tbreaten to burn the white men at tbe stake if they do not leave tbe Indian lands. The gold ledges, which both the reds and the whites are so determined to possess, are well defined, the formation being decomposed quartz, the ore being free milling and unusually rich. The copper ledges are said to be very large and valuable, it being claimed that they are in the great mineral belt in which Marcus Daly's famous Anacouda mine is located. The reservation will probahly next year he thrown open to settlement after the Indians have been allotted their share of the land, bnt it is feared that there will be considerable trouhle experienced before the ownership of the stores of mineral wealth is finally settled. It has long been known that the gulches of the Lemhi Indian lands were full of gold, the redskins having frequently displayed very large nuggets and many specimens of gold qnartz, that, in richness, equaled the picked ore taken from the Nelson ledge in Angel's Camp, Calaveras conuty, California.

Indian Creek and Neal.—Elmore *Bulletin*, Dec. 16: Judge John Andrawatha came in Wednesday from near Mayfield. He says the Indian creek section is on the eve of a gennine boom, and that even now all is bnstle and activity at the reservoir camp and in Neal mining district. Tuesday, Mr. Clark, manager of the Indian Creek Dam Company, had at least 100 men and 40 teams employed excavating for a dam across Indian creek, which is to be completed by the first of Februery. They have fonnd bedrock at a depth of abont 15 feet, upon whicb will be laid a cemented stone foundation, which will secure a good supply of water heretofore running to waste heneath the lava rock in the bed of the channel, and which they are now compelled to use pumps to keep down. Judge Andrawatha says that Plowman's quartz mill is running steadily and turning ont bricks of gold at regular intervals. The ore not only gives good returns in free gold, hut produces concentrates that assay $200 per ton. Mr. Plowman is highly pleased at his venture in Neal district. Other mines outside those of Mr. Plowman are producing good ore, and another mill, for custom work, will be erected there early next spring.

LOWER CALIFORNIA.

Alamo.—*Lower Californian*, Dec. 14: A friend writes from Alamo: "Tell your friends that Alamo is not dead yet. The Moctezuma mine took out lately 20 tons of ore which represents a value of $20,000. Also on the Tarantula they found ore which ran up to $75 a ton. Joe Peterson is getting things ready at the Aurora to commence work again. The placer workers are getting out a good deal of gold, one husiness honse alone buying in one dey more than $200. The weather is fine and there is plenty of water for washing gold. A good deal of prospecting is heing done also."

MONTANA.

Closing Down.—Butte *Miner*, Dec. 16: The Anaconda properties are closing dowu two at a time, the last to suspend being the Green Mountain and Weke-Up-Jim belonging to the syndicate. These mines ceased their production with the expiration of the work of the day shift on Saturday evening, and will not he started up again until the "hlue dust" at the smelters is worked up, which will require from a month to three months' time. Of the Anaconda mines only two are now producing, and it is said within the next three days they, too, will be shnt down to await the consumption of "blue dust." The two are the Anaconda and St. Lewrence, which adjoin each other. The four mines now closed are the Mountain Consolidated, Higb Ore, Wake-Up-Jim and Green Mountein, the shafts of all of which are being deepened. The numher of meu tbus far thrown out of work hy the Superior aggregates at least 500, many of whom have already left the city and the smoke. Those remaining have a few thousend dollars in their possession, and wonld jnst as soon take a rest as keep on working. At Aneconda only one smelter is in operetion, the other having closed dowu several weeks ago.

Boston and Montana.—With the closing down of the upper smelter, this company hes commenced to phalanx its miners, the first draft being made on Saturday evening, when 16 were laid off at tbe Mountain View. The reason for this is apparent. By the closing down of the works the demand for ore is not so great by 250 tons per day, and there is therefore no room in tbe mines for the large number of men the company has been employing. As to the rumor that all the men working in the lower levels of tbe Butte end Boston properties were to be laid off, those in position to know characterize it as absurd, and wonder where it originated. Tbe Butte & Boston is moving along in the even tenor of its way, and will continue to extract ore enough to keep the smelter turning out its full measure of copper and silver.

The Toledo of Manison.—P. J. McLeary, manager of the Toledo mine in Madison county, was in the city last week and spoke very well of the property. The orebody is from five to six feet in width and carries from 15 to 20 per cent lead, $15 to $20 in gold, and from 30 to 250 onnces silver per ton. Mr. McLeary has a lease and bond on the property and is working 10 or 12 men. Operations are being pushed in the crosscut from the 300-foot station, which is being driven to strike the large ledge. The Toledo is owned principally by Butte men, and has always been considered good.

NEW MEXICO.

Bullion.— Silver City *Enterprise*, Dec. 16: The Maud S. is now working 33 men. A winze will soon be started in tbe lower level. Tbe miners are kept busy supplying the mill with ore. The Maud S. shipped another brick yesterday, wbich makes the 25tb since October 22, 1892. The average weight of each brick has been 82 pounds. As the planchas are one-third gold, tbe value of bullion shipped from the Maud S.—now the Colonial Mining Company—can easily be estimated. The Chance has shipped three bars of bullion since November 18th, weighing respectively 85, 84 and 85½ pounds. Considering that the mill has run only about three weeks the showing is not so poor. The Chance is working smoothly. Twelve feet of ore has been encountered in the winze, which is said to he worth $40. The Kingston smelter is running a good part of the time. One dey last week it treated 32 tons of ore in six hours, which is pretty good, considering that its capacity is rated at 32 tons in 24 hours. The Pacific Company has purchased the vanners in the Deep Down mill and as soon as the weather will permit will remove tbem to the Pacific mill in this city, after which the Pacific mill will drop 20 stamps on ore from the Pacific mine. The company will continue to run the Key mill, making in all 35 stamps.

Organ Distaict.— Rio Grande *Republican*, Dec. 17: In the Bennett-Stephenson property development is constantly showing increased bodies of ore. There are now 4000 to 5000 tons of concentrating ores on the dumps of the Bennett and nearly half that amount on the Stephenson. The concentrator, which is constructed just helow the mouth of the tunnel, is approaching completion but will not be in shape to treat ore hefore the new year. It is a well-eqnipped and complete plant with a capacity of about 50 tons per day. Tramways have been constrncted so that ore can be landed in the concentrator at a minimnm cost. A hoist for working below the tunnel level is already on the ground. It was the intentiou to pnt in an engine uear where the hoist will be located, at the point where the tunnel intersecte the Bennett vein, but Col. Thornton has about concluded to use compressed air as the motive power and furnish it from the concentrator. Tbe outlook for the property appears very hright.

OREGON.

Coppea.—Rogue River *Courier*, Dec. 16: Capt. L. Burbridge returned from the Waldo copper fields last week after investigating the probable extent of ore out there. He thinks well of that country and will so report to the capitalists who sent him. He will take steps to have extensive prospecting done, and if the resnlt is satiefactory, smelting works will be set up out there. He is in the employ of the Pyritic Smelting Co. The Captain went to San Francisco Monday.

The St. Lawrence Ledge.—J. C. Hoar and S. P. Donglas have purchased the St. Lewrence mine of L. Higgins. This valuable ledge is three miles from Wolf creek and rich ore cen be traced the entire length of the claim—1500 feet. The lode avereges four feet in tbickness and the ore assays $40 to $400 to the ton.

SOUTH DAKOTA.

The Iron Hill and Seabury.—Deadwood *Pioneer*, Dec. 16: If the many valuable mining properties of the Hills which are at present heing operated at the minimum, for leck of railroad outlets, could only have proper railroad connection, how this conntry of hills and gulches and wealth of mineral would boom. The thought is brought out hy a brief cbat with Robert Cooper, of the Iron Hill property, uear Cerbonate camp. This miue, since coming into the hands of its present owners, has heen systematically developed and exposes at present fully 20,000 tons of low grade silver ore, good for from 20 to 30 ounces of silver to the ton and carrying from $2.50 to $4.00 of gold. There is the same trouble, however, that bas confronted the company for some time—a sbortage of lead, although recent developments show that condition as slightly improved. The work has been carried on for some months with a force of niue men, and within the present fiscal yeer, up to November, about 500 tons of ore was shipped to the D. & D. smelter, on which the return was as above indicated. The Iron Hill people have their own reduction plant, of 60 tons capacity, hut their ore does not carry snfficient lead to warrant operating the mill, and the distance for wagon transportetion—six miles to the F. E. & M. V. railway—brings any but pretty high grade ore below the line of profit. The condition which confronts the Iron Hill people also obtains in the Seabnry property, adjoining. Both companies have done extensive development work with about the same degree of encouragement, and which is considered very satisfactory for the progress made. The Seabury has shipped a good deal of ore to the D. & D. smelter, but not so mnch as has the Iron Hill. The return was about the same. The Seabury people hope to solve the problem by means of their diamond drill, which will extend their investigations to a depth of 1100 feet. Owing however to an error in shipment of a portion of the machinery, the drill cannot be gotten into operation much before January. Of course a good lead-bearing ore would be a grand thing for these mines to tep, hut what is really needed is a railroad outlet. If the lead dificulty could be overcome, the Iron Hill reduction mill would be started at once, and with its own and contiguous mines, would probably have all it could do; but in any event a railroad outlet is greatly to be desired, and it is gratifying to know tbat the prospects for the building of a line from the F. E. & M. V. to the mill are considered favorable. The route, over a comparatively easy grade, wes surveyed about a year ago, and since that time the Iron Hill and Seabury people have tried hard to secure the construction of the line, the advantage of wbich would undoubtedly be mutual on the part of the railroad and mining people.

UTAH.

A Tunnel.—Park *Record*, Dec. 17: From time to time during the past five years there has been talk of a grand consolidation of the many groups of mining claims on Treasure hill, the object being to drive a long tunnel from "Nigger Hollow" tbat would prospect the entire hill. The *Record* has spoken of the enterprise a number of times and called attention to the importance of such an undertaking and urged its consumation. It now seems that the enterprise is an assured fact and that early next summer will see operations commenced. The tunnel will be rnn from "Nigger Hollow" to the Silver King shaft, a distance of about 4000 feet, and will prospect the Kentucky, Mayflower, and Silver King ground thoroughly, and will undoubtedly expose several large bodies of ore. The tunnel will be equipped with an engine, air compressor and power drills from the Woodside, and once started, the work will he prosecuted vigorously. This enterprise and the Crescent tunnel will make matters lively in that section next summer.

Cyanide Process.—Park *Record*, Dec. 17: H. F. Geer, of the Columbia Mining and Milling Compauy, who are putting in a cyanide plent to work the tailings of the old Shoebridge mill in Tintic valley, is in town. He informs us that everything will be ready to commence on the tailings by Monday. The tauk has a capacity of 120 tons, and about 30 tons will be treated daily. The tailings contain from $10 to $12 in silver and gold, end they expect to extract 60 per cent of the silver and 90 per cent of the gold. It is estimated that there are 10,000 tons of the tailings. Papers were drawn in this city yesterday hy wbich Geo. C. Ross secnres a bond and lease on the Mammoth, a property lying between Copper and Spring gulches, Tintic district. By the terms of the contract, Ross is to do at leest 20 days' work on the gronnd each month, and pay a certain per cent of all ores shipped as royelty. The bond is for $50,000. The lease and bond expires Dec. 5th, 1893. Frank H. Clifton, A. M Wook and Rena Keate, of this city, are owners of the property. The Buckeye Mining Company, whose property is situated at the foot of Rising Sun mountein, south of Silver City, is in a very prosperous condition, and for a company very recently organized is making quite a record. Three shipments have already been made this fall, the last one of 13 tons arriving yesterday. The product is an iron ore, and the present shipment averages over 50 ounces silver and 1½ ounces in gold. The high per cent of iron it conteins makes it a very desirable fluxing ore. The company is at present operating with a windlass, hut has purchesed a steam hoist and will have it in operation soon, after which the shipments will be more frequent. Onr readers will notice with pleasure that the Centennial Eureka Mining Company has resumed the payment of dividends, and that on the 20th of this month $15,000 will be divided among its stockholders. Since its suspension of dividends last spring the Centennial Eureka has put up a magnificent hoist. There are large reserves of ore in the mine, some of it of very high grade, and the financial condition of the company is in excellent shape; all of which reflects great credit on the management of the affairs of the company, which has always been satisfactory to the sharebolders at large.

WASHINGTON.

The Oln Dominion Soln.—Spokene *Chronicle*, Dec. 14: The Old Dominion mine, near Colville, has been sold to Ferdinand Peck of Chicago for $100,000. Mr. Peck has been in Spokane for some time past, the gnest of Messrs. Dennis and Bradley, hut it was only known by a few of h s most intimate friends that he had the pnrchase of the Old Dominion under consideration. It is said the mine will now he worked on an extensive ecale, and that operations will be commenced at once. The bnsiness of the mine will be done throngh a corporation, of wbich G. B. Dennis, Cyrus Bradley and George Forster are the principal Spokane parties.

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Dec. 22, 1892.

SILVER—The same deplorable conditions surround silver that have been reported in these columns from time to time. The recess of the International Conference has distroyed all hope of relief directly from that source, though much is hoped indirecly from the discussion and general agitation of the quest on by the Conference In other words, its educational feature has been of value. Silver men now fear that the price may go even lower, though it does seem that the bottom has been reached.

QUICKSILVER—Market steady at quotations.

ANTIMONY—There is very little change to note. Sales are small and the market easy.

BORAX—The market is firm.

PIG LEAD—For two weeks there has been no notable change. Quotations are, however, a trifle higher, advancing a fractioo.

TIN—Nothiog new to report.

COPPER—Henry R. Merton & Co. report the stock of copper in Eogland and France and afloat thereto from Australia and Chili on the 1st December as follows:

	Price.	Tons
1890	£45 7s 6d	65,410
1891	41 2 6	57,620
1892	47 17 8	53,498

The quantity in sight on the 1st of each month in the past year has not varied much, the extremes being 59,738 tons August 1st to 53 498 tons December 1st. It is worthy of note that the price on the 1st of this month is higher than at the opening of any previous month this year and is £3 better than when the stock was the largest. James Lewis & Sons of Liverpool, sales of 20,000 tons in November at £45 8s 9d to £47 7s 4d. Since the 1st instant have eased off some in the Liverpool market. The quotation in that market on the 13th was £47 7s 6d. The situation is considered strong both in this country and in Europe. There have been large sales of Lake copper in Boston and New York in the past few weeks at 12c to 12½c. There is no doubt a speculative element present in these movements, though the legitimate demand is considered to be quite large and active. The promised decrease in the product of the Montana mines is also an element of strength in sustaining prices. The local market in San Francisco has a firmer tendency, in sympathy with better prices in the East.

COAL.—There was some talk of an advance by dealers to jobbers, but apparently it has not yet taken effect in the general market. Prices are low and likely to remain so for some time, unless there is a forced restriction of the output in the northern mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitore for Pacific Coast.

FOR THE WEEK ENDING DEC 13, 1892.

487,978.—CULTIVATOR—James Birch, North Ontario, Cal

488,066.—ROLLER BRAKE—H C. Finkler, S. F.

487,731.—SNATCH BLOCK—Geo. Harvey, S. F.

488 120.—CAR-COUPLING—Haub & Hashn, S. F.

488,076.—SWINGING CRANE—J. W. Kinsman, S. F.

487,753.—TRICYCLE—C. Koening, Stockton, Cal.

488,077.—HORSESHOEING APPARATUS—James Lamb, San Jose, Cal.

487 759.—INK ROLLER—R. W. Murphy, Seattle, Wash.

487,961.—AUTOMATIC WATER-GATE—G W. Norton, Yuma, A. T.

R 11,295.—REPEATING GUN—W. H. Ostrander, Merced, Cal.

488,085.—CLIP FOR WIRE ROPEWAYS—B. McIntire, S. F.

487,937.—PHOTO-PRINTING APPARATUS—U. S. Rush, Tacoma, Wash.

487,805.—TRANSMITTING POWER—W. E. Walsh, S. F.

The following brief list by telegraph, for Dec. 20, will appear more complete on receipt of mail advices:

San Francisco—John B. Houston, piston-rod packing; Robert D. Hume, can-body forming machine; Auscn L. Munson, antifouling paint; John W. Raymond, gas engine; Maud Wyman, slate attachment. California—John H. Gregory, loue, wrench; James McDonald assignor of one-half to M. McDonald, Los Angeles, feed water-heater and purifier; Orrlugs Lard Los Gatos, animal trap. Washington—Sidney A. Lake, Lakeview, nut lock; William H. Norris, Spokane, non-beat-conducting covering.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

There is little of interest in the mining share market, prices continuing low. The fifty cent assessment on Cons. California and Virginia has given stocks a worse setback than anything that has happened for some time. The assessment is due to the condition of affairs in the mine, which, through the breaking out of the gas in the lower levels, has been almost entirely shut down. The company is also in debt to the amount of $41,000. The Con. Cal. & Va. has been a wonderful piece of mining property. Prior to consolidation 13 assessments were levied on the California, aggregating $1,104,000. On Con. Virginia 20 assessments were levied, amounting to $1,155,900. Since the consolidation in 1885 two assessments were levied on the joint stock, aggregating $108,000—making the entire amount collected in assessments on the property $2,368,900.

The old Con. Virginia before consolidation with the California disbursed in 53 dividends to stockholders $42,930,000. The 34 dividends disbursed by the California aggregated $31,320,000. Since the mines have been consolidated $3,628,000 has been disbursed in dividends, making a grand total of $77,878,000 paid out.

A special meeting of the stockholders of the Pacific Coast Borax Company has been called for February 18, 1893, to consider a proposition to increase the capital stock from $1,500,000, divided into 1500 shares of $100 each, to $2,000,000, divided into 2000 shares of $100 each.

The Mayflower Gravel Mining Company paid a dividend of 25 cents per share on the 15th. The company has a large surplus. Hereafter monthly dividends of 10 cents per share will be paid, and extra dividends will occasionally be declared out of the surplus.

The Great Western Quicksilver Mining Company has declared a dividend of 25 cents per share, payable immediately.

The Champion Mining Company of Nevada county has declared a dividend of 10 cents per share, payable December 19th.

At the regular annual meeting of the stockholders of the Ophir Mining Company 88,200 shares were represented and the following officers elected for the ensuing year: Charles H. Fish, president; Nat T. Messer, vice-president, and A. W. Havens, George R. Wells, William S. Lyle, Herman Zadig and C. O'Connor, directors. E. B. Holmes was re-elected secretary and D. B. Lyman superintendent. The secretary's financial statement showed an overdraft of $4032 16. The superintemdent's annual report shows that there has been extracted during the year from all parts of the mine, 698 tons of ore. This quantity, added to the 247 tons which remained in the orehouse at the date of the last annual report, makes a total of 945 tons, all of which was milled, part at the Eureka mill and part at the Mexican mill. From all this ore there has been produced bullion of the assay value of $15,609.89, which shows an average yield of $16.51 per ton. The bullion carried $6600 41 in gold and $9009.48 in silver.

At the annual meeting of the stockholders of the Kentuck Mining Company $60,229 shares were represented and the following officers elected for the ensuing year: R. E. Kelly, president; H. Zadig, vice-president; and W. H. H. Hart. Sol Jacobsand A. Waterman, directors. A. Waterman was elected secretary, vice J. W. Pew, and J. H. Kinkead superintendent. The financial statement showed a credit of $2854.66.

At the annual meeting of the Gould & Curry Mining Company 85,151 shares were represented, and the following officers elected: H. B. Havens, president; Charles H. Fish, vice-president, and Herman Zadig, Thomas H. Fish, J. N. Souther, Thomas Anderson and Robert Sherwood, directors. A. K. Dunbrow was reelected secretary, and P. Kirwin, superintendent. The secretary's financial statement showed an indebtedness of $9055.79. During the year there was milled at the Occidental mill 500 tons of ore, 287 tons of which were extracted from the old stopes on the 200 and 400 levels, the balance being on hand in the orehouse from the previous year. The assay value of the bullion obtained from this ore was $5935.28. Average battery assay, $18.78; percentage of the battery assay obtained, 63 2-10 per cent.

At the annual meeting of the Andes Mining Company 96,144 shares were represented, and the following officers elected: Nat T. Messer, president; L. C. Fraser, vice-president; William S. Lyle, C. O'Connor and H. Zadig, directors. J. W. Twiggs was reelected secretary and Joseph R. Ryan, superintendent. The secretary's financial statement showed a credit of $3978.86.

At the annual meeting of the stockholders of the Mount Diablo Mining Company 32,746 shares were represented, and the following officers elected: J. M. Shotwell, president; J. N. Knowles, vice-president, and G. W. Grayson, Louis Teese Jr. and R. W. Heath, directors. R. W. Heath was reelected secretary and his financial statement showed a credit of $5192.62.

At a special meeting of the Union Con., C. C. Harvey was elected secretary, vice A. W. Barrows, deceased.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROLLER BRAKE.—Henry C. Finkler, S. F. No. 488,066. Dated Dec. 13, 1892. It consists of a roller adapted to rotate with or upon a shaft, and having adjustable frictional endplates by which the pressure upon the roller may be regulated and the amount of friction upon the contacting surface increased or diminished. The object of the invention is to provide a braking device in which the wearing friction is removed from the contacting surfaces which are less liable to damage or constant wear and which are easily removed at any time, and it is especially applicable for use upon brakes which are applied to surfaces easily injured, as in the case of rubber bicycle tires, wire cables, ropes and other similar surfaces.

HORSESHOEING APPARATUS.—James Lamb, San Jose. No. 488,077. Dated Dec. 13, 1892. This invention relates to that class of apparatus designed to receive, hold and support a horse during the operation of shoeing. The object of the invention is to provide an apparatus of this class adapted to easily receive the horse and hold him firmly, at the same time supporting him thoroughly with comfort to himself and safety to the operator.

SWINGING CRANE.—James W. Kinsman, S. F. No. 488,076. Dated Dec. 13, 1892. This is a swinging crane for loading and unloading vessels and other carriers, and for removing and depositing material. The crane is easily operated and so simply constructed that there is not liable to be confusion or complication in its use.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3 Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

BY P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow or Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco, Cal.

The Explorers' and Assayers' Companion.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

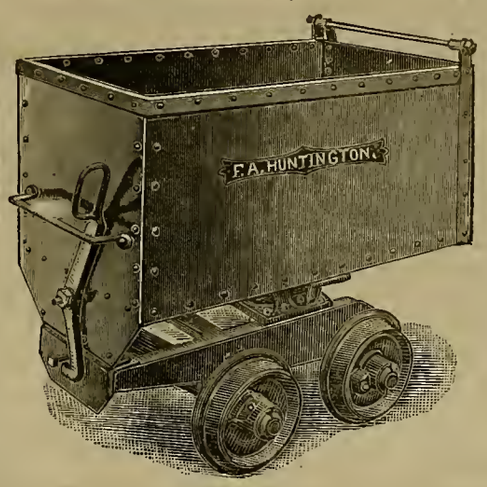
Reduction of Ferric Sulphate in Volumetric Analysis.

The difficulties attending the reduction of ferric sulphate in the determination of metallic iron by the method of Marguerite are often serious, and affect time, patience and accuracy. They depend upon the condition and purity of the zinc used, the state of saturation of the solution, acidity and temperature. There is a preference for the Marguerite method in determining metallic iron for several reasons. Only facilitate the reduction of the ferric sulphate and it is the most valuable of all methods, combining the utmost rapidity with the highest accuracy attainable. There is no difficulty in obtaining iron as ferric sulphate; but the reduction of this to the ferrous state has hindered the precision of the permanganate method. Discrepancies are all to be set down to the errors introduced in the reduction with zinc.

Mr. Clemens Jones, of Hokendaqua, Pa., wrote for the American Institute of Mining Engineers some time since, a paper on "A Rapid Method for the Reduction of Ferric Sulphate in Volumetric Analysis," in which he showed that a solution of ferric sulphate is instantaneously and completely reduced by filtering through pulverized zinc. The apparatus designed by him for the rapid reduction of ferric solutions is shown in a cut on this page.

It consists of two cups, A and B, of about 300 c.c. capacity, the outlets of which connect alternately, by means of a 3-way cock C, into the joint-tube D. This tube is provided with a packing space *d*, which is filled with an asbestos roll, kept in place by a ring of cork. The tube moves up and down freely. At its lower end *e*, it is ground to fit the detachable tube E. This is for the pulverized zinc, and at its lower end has a stopper *f*, ground to fit the titrating flask F, of about 700 c.c. capacity. The stop-cock G connects with the vacuum pump. The tube E is disconnected by pushing it up, grasping the neck of the flask with one hand, removing with the other the round block which supports the flask, and then detaching the flask F. The tube E now rests on the little shelf shown in the cut. This is drawn out, and frees the tube at its ground joint *e*.

A wad of fine glass wool, sufficiently thick to make a good filter, is inserted in the tube, and the pulverized zinc is filled over this, for four-fifths the length of the tube. This holds about 300 grammes, which is enough for 60 filtrations. The tube is then replaced by reversing the manner of removal, connection is made with the filter-pump, and the apparatus is ready for use. It is first necessary to wash the column of zinc with dilute sulphuric acid. This acid is made up of one part of acid of 1.84 sp. gr. to two parts of distilled water, and is used throughout in all work upon iron determinations. Of this about 30 c.c. is taken, transferred to the cup A and diluted to 50 c.c. The stop-cock G is opened for suction and then the 3-way cock C is turned to discharge the cup A. A vacuum of five to six pounds, or more, gauge indication, must be used, since the large volume of disengaged hydrogen retards the filtration. The cup and column of zinc are then washed free from acid by fine rinsings. This operation is repeated four times and is then finished for this tubeful of zinc. The same procedure is adopted to reduce a ferric sulphate solution, except to use both cups, A and B. After the first is emptied it is washed five times. This incidentally cools the column of zinc and retards unnecessary solution. The other cup is then connected by turning the 3-way cock C, and washed in like manner. In each case this suffices to free the apparatus from all traces of iron or sulphuric acid. G is then closed, the 3-way cock is turned again to relieve the pressure, and the flask is removed. Time for reduction, two minutes.



THE HUNTINGTON IMPROVED ORE CAR.

(*See page* 427.)

FIG. 1.

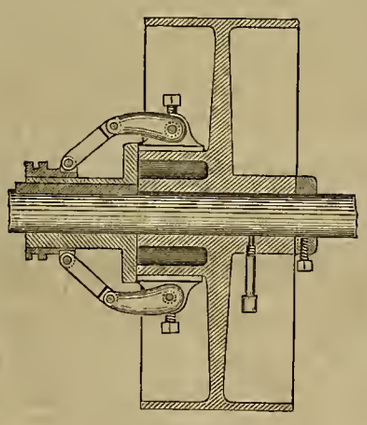


FIG. 2.

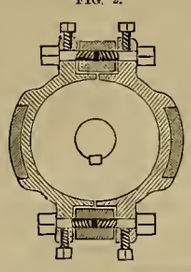
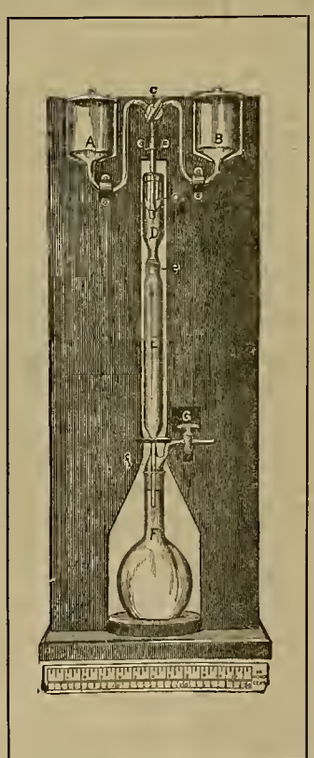


THE BARNES SCREW LEVER FRICTION PULLEY.



APPARATUS FOR REDUCTION OF IRON SOLUTIONS.

Barnes Friction Clutch Pulleys.

The accompanying cuts represent the principles of one of the latest improvements in the line of friction clutch pulleys and cut-off couplings manufactured by the J. H. & D. Lake Company, of Hornellsville, N. Y. Fig. 1 affords a sectional side view of the Barnes screw lever friction pulley in released position, showing the driving hub keyed to the shaft.

Fig. 2 is a sectional end view describing the friction hub encircled by friction-ring, the former of which is cast in one solid piece with the pulleys. Projecting lugs on opposite sides of the driving hub of the ring drop into lugs, or lug cavities, of the friction-ring, and when the clutch is on these lugs take all the driving power. This is an improvement over the old bolt fastening system, the bolts of which are more liable to be affected by the twisting strain upon the hub from the friction of the clutch. At the extreme top and bottom of Fig. 2 is shown a view of a simple device which evades the use of much complicated machinery, and more than substitutes the corresponding complex parts of some previous inventions. It is a lever nut on each side of the friction-ring, one-half of the nut being cut with a right thread and the other half with a left thread. Sufficient space between opposite sections of the ring is given for contraction or clutch, which is affected by means of right and left thread screw-bolts entering the lever nut from opposite sides, secured by set-screws. Duplex levers are attached to these nuts at their upper section and to the hub at their lower section. When the shipper sleeve is thrown against the flange by the operating lever, the duplex lever turns the nut sufficiently to produce a friction that was never known to lose its grip, nor has a thread of these screw-bolts ever been known to break. The screw-bolts are adjustable to any desired pressure, however, in case the clutch should ever become lax. They give the pulley a positive grip and absolute release from the hub by each opposite shift of the operating lever, without the use of springs. The Barnes screw lever friction clutch pulleys and cut-off couplings are adapted to both heavy and light work.

A CORRESPONDENT of an Eastern exchange asserts that the possibilities for a considerable advance in copper were never greater than at the present time. This may be fairly inferred from the fact that copper is now exported at even higher figures than rule in this country, and the tendency of the foreign market is still upward. One of the most important factors in the consumption of copper is the electric railroad business, which, should the developments expected during the ensuing year materialize, has a brilliant prospect before it, such as will be unprecedented in the history of electric railway building.

IN MONTANA the copper ore is combined with sulphur, antimony and arsenic, and it requires a long series of smelting operations to secure pure copper, so that ten per cent ore there is no more profitable than four per cent ore at Lake Superior. The Montana mines have, however, an advantage in the fact that one-third of an ounce of silver goes with every per cent of copper,

Comment.

An example of cheap mining work is shown by what was exemplified in the month of November at the Seven Stars mine, Hillside, Arizona. No. 2 level, north, was extended 40 feet by one man at $2 50 per foot; total distance 334 feet. No. 3 level, north, extended 32 feet by one man at $2.50 per foot; total distance 624 feet. No. 1 level, south, extended 51½ feet by one man at $2 50 per foot; total distance 531 feet. No. 2 level, south, extended 61 feet by two men at $2.75 per foot; total distance 1158 feet. No. 4 level, south, extended 52 feet by two men at $2.75 per foot; total distance 153 feet. The seven men averaged for the month, 34 feet. The maximum wages are $3.50 per day, though the contractors expect to make $4 per day. Mr. T. A. Rickard, the manager, informs us that the lode is a nearly vertical vein, cutting through a nearly horizontal talc schist. The layers of quartz are two to six inches thick, and separated by thin seams of talc. The ground drills fairly hard, but breaks very readily. In the other mining work the rises cost about $2 per foot; winzes $3 to $3.50 per foot, and crosscuts $2 to $3.50 per foot. All this is remarkably cheap work in mining operations.

While numbers of parties have gone to the diamond fields (?) in Idaho, it is pretty certain that the whole excitement about the gems was on a false basis. It is even believed by some that the ground has been salted. The surface of the basin is bestrewn with shiny pebbles and quartz gravel, and several ignorant men have eagerly gathered up large quantities of the worthless stones. Even if diamonds were to be found in the basin, water for washing them out could not be obtained unless brought from Snake river at a cost of at least $4,000,000. Nearly all the basin land has been located, and claims have been staked out more than three miles from the basin. The land is located as placer ground, each claim being 15 acres in extent. None of the men know anything about diamond mines, and the experts (?) only spent an hour or so at the basin. They then had work stopped at the "ledges," and went off to Chicago to organize a stock company. All this sounds rather fishy. If Mr. Kunz is the expert he is reported to be, he would scarcely talk about "diamond ledges" in that off-hand way, because they do not get diamonds in ledges. Moreover, it does not look very well for him to make an agreement not to do any more work on the "diamond ledge" until he returns from Chicago, where he has gone to organize a stock company. If as rich as reported, no stock company is needed to open the fields. It should be borne in mind that this Mr. Kunz is not George Frederick Kunz, the gem expert of Tiffany's, New York, and the author of a standard work on Gems and Precious Stones. If any stock company is formed, our advice would be for people not to buy any stock for the present. We had a little experience of this kind in California once, which ended disastrously to all except the stock promoters. Mr. Kunz may know something of cut diamonds, and nothing of diamond-mining. A jeweler is not apt to know so much about how they mine precious metals and gems as about preparing them for sale. Stopping work in the ground and rushing off to start a stock company is not going to create any great confidence in the new-discovered fields.

The Caminetti hill will come up in the Senate shortly after the holidays. Ex-Representative C. P. Berry is already in Washington in the interest of the anti-debris people trying to get a penal clause attached to the hill. As the bill only permits hydraulic mining under certain conditions, and the present sections provide penalties, it is not clear what additional measures he needs. It is clear, however, that the miners must again send a delegation to Washington to look out for their interests. The miners only want what is fair; that is, permission to run their mines if they can do it without injury to other interests. The miners of this State must put their hands in their pockets and send some more money to the Executive Committee of the State Miners' Association to permit them to send one or more persons to Washington to look after this hill. It will not do to neglect this. The Caminetti hill has already passed the House and Senator Felton will help it through the Senate; but *personal* assistance from the Miners' Association is necessary and should be given at once.

THE current volume of the MINING AND SCIENTIFIC PRESS closes with this number. The index on the last page indicates the wide scope of the subjects treated during the last half-year, and should be an assurance to those engaged in mining or other industrial pursuits on this coast, that all their interests have received due attention. The miners on the Pacific Coast should not only aid the editors and publishers by their subscriptions, but also by sending notes of such matters as may be of interest and value to fellow-craftsmen. All will be mutually benefited by such a course. The information published in the last six months has been of the greatest value to the miners and millmen who take the PRESS. The iron workers and electricians, and all others engaged in industrial enterprises of any kind have not had their interests neglected since we have endeavored to give their departments full attention. It is desired to still further improve the PRESS, for which purpose the hearty co-operation of its readers is needed. The editors are always pleased to receive communications which may be of general interest, and during the coming year it is hoped many of them will come to hand.

Building Government Vessels East and West.

It would seem as if some arrangement should be made by which the Navy department could award the contract for one of the new vessels to the shipbuilders of the Pacific Coast. It is true that the Cramps of Philadelphia put in the lowest bids on both of the proposed vessels, and that the bid of the Union Iron Works of this city was too high. The difference was very small, however, and efforts are being made to get Secretary Tracy to divide the work, and have one ship built on the Atlantic and the other on the Pacific Coast. The contracts will not be awarded for a week or so, and it is understood that the Secretary of the Navy has asked the opinion of the Attorney-General as to his right to award the contract to any but the lowest bidder. Mr. Irving M. Scott, of the Union Iron Works, is in Washington, and is still hopeful he will get one of the vessels to build. The Government should make a difference between the East and West in shipbuilding contracts on such a basis as will give the builders on this Coast a chance for the work. Coal, iron and labor are cheaper there, and transportation rates westward are high.

It should be the policy of the Government to encourage extensive shipyards on the Pacific shores. It ought to be glad to have an institution maintained by private individuals ready to build or repair its ships on any scale. An immense establishment equipped with expensive tools and appliances is ket in working order at no expense to the Government. Skilled mechanics make their homes here ready to undertake the Government's work. There should be some percentage established which would permit shipbuilders on the Pacific to bid against Atlantic builders without loss and with some hope of success. It is a trip of many thousand miles around Cape Horn, and Government vessels must be kept here as well as East. If the difference in cost of building here, and bringing a ship around the Horn, could be deducted from the bids, there would be more chance for our local builders. But even with the smaller vessels of the Coast Survey, Lighthouse or Revenue Service, all must bid on the same basis. The result is most of the work goes to the East, even if the vessel is for use here; but by the time she gets on her station she costs $10,000 or $15,000 more than the local builders bid to construct her.

The Mare Island Navy Yard is not fully equipped for building large vessels for cruisers or fighters; yet the Union Iron Works are. Still, if the Government offers no encouragement to these works, they cannot be successfully maintained for building warships. The occasion may come at any time when a fine shipyard like this would be a vital necessity to our Government; yet to save ten or fifteen thousand dollars on a million-dollar contract, it gives all the work to one shipyard having already plenty to do, and leaves out in the cold another yard—the only one on the Pacific Coast of the United States. This state of affairs ought to be remedied, and at once. There must be some way by which justice can be done to both sides of the continent and the work distributed among the mechanics of both the Atlantic and Pacific Coast.

Foundry Notes.

The complaint of dull times is universal among the foundrymen. None of the shops are running full-handed at present and orders are comparatively few. With the advent of spring, however, better business is looked for.

The Joshua Hendy Machine Works have received of late a number of letters from the Australian colonies asking for detailed information and figures concerning the hydraulic gravel elevators in use in California. The Hendy Co. own the patents on this device, and are the only manufacturers. There are numerous places in Australia where gravel elevators will be especially useful, mainly, of course, in such claims as have insufficient fall where the ground is low.

Albert H. Stahl, who has been stationed at the Union Iron Works for some time past, has received an order from Washington notifying him of his appointment as United States Naval Constructor, to oversee the completion of the Monterey, Olympia and Oregon, now under way at the Union Iron Works. Naval Constructor Stahl is one of the youngest, if not the junior, of the fourteen naval constructors in the service. In addition to that responsible office, he is inspector of cellulose, member of the board of inspection for the inspection of war vessels, and a member of the board to prepare plans for the construction of merchant vessels so as to fit them for acting as an auxiliary to the United States naval forces should an emergency arise that would require their aid. Mr. Stahl served for two years at Cramps, Philadelphia, and then, after a visit to Europe on naval business, came to this city as assistant naval constructor. He has for some time been acting as full U. S. naval constructor, but his official appointment to the position was only received this week.

A. P. Brayton, of the Pelton Water Wheel Co., went to New York this week on a business trip.

Mr. Lacy, of the Parke & Lacy Co., has returned from Australia, where he has been for the past eight months. The firm has a branch house in Sydney, where a large business is done in mining machinery.

The Pacific Coast Steamship Co.'s steamer State of California has been on the dry-dock at the Union Iron Works nearly a month having new plates put in her bottom and undergoing a thorough overhauling. She came off the dock this week. The U. S. Coast Survey steamer Patterson has also been undergoing her annual overhauling at the Union Works.

A. P. Brayton has just returned from Colorado, having passed most of his time at Aspen, where Pelton wheels have been put at work operating the dynamos for a large electric power plant.

The Risdon Iron Works are building two four-foot sectional Bryan mills for the Candelara mine in Mexico. This mine already has four of these mills. These works are also figuring on an installation of four Bryan mills and another of seven, These will be equal to plants of 60 tons and 100 tons respectively. A five-foot Bryan mill has just been sent to the Phœnix mine in Butte county.

Wm. Lakin, as administrator of the estate of James M. Thompson, has brought suit against Ira P. Rankin and his former partner, A. P. Brayton (Pacific Iron Works) for an accounting of the profits of a business conducted under a contract between Thompson and John Howell on the one side and the firm of Rankin, Brayton & Co. on the other. The contract was executed in 1865, and under its provisions the defendants agreed to manufacture certain patented rotary furnaces, the patent for which was owned by Thompson and Howell. Lakin alleges that Rankin and Brayton violated the terms of the contract, Lakin has demanded an accounting, but has not been able to secure one. He says the books are in the possession of Rankin,

hut in such a mixed and uncertain state that Rankin was unsble to extract from them any definite informstion. Lakin believes that under a full accounting he will be entitled to a judgment against the defendsnts for about $15,000. Anyhody who knew James M. Thompson will wonder thst he died leaving any uncollected accounts or that anyhody would get tbe hest of him in money matters. Tbe Pacific Iron Works huilt many of these furnsces and Thompson was paid hy the pound, the furnaces averaging about the same weight. On one occasiou he found one to weigh differently from tbe average, and on this hased tbe claim on which this suit is started. Mr. Brayton sold out of the Pacific Iron Works some years sgo, and the works have since closed out altogether; but in dissolviog tbe partnership Mr. Rankin assumed all the responsibilities, so that Mr. Brayton himself is not interested in the resu't of this suit.

The unofficial tests of the coast-defense vessel Monterey have heen continued this week. On the trial of Tuesdsy the speed was gradually increased until the maximum of 157 revolutions wss resched and a speed of 14 knots an hour attained. On the last trial prior to this one the revolutions of the propeller resched 130 and the speed 12¾ knots (estimated), but even at the incressed speed the engines and machinery seemed to sct with as much smoothness, and with even greater effectiveness, than ever before. The results thus far lead the builders to expect a good honus for the horse power developed over the requirements. The pitch of the propeller blades is to be chaoged, hut this can be done very easily from the manoer in which the wheel is constructed. After another test with the new pitch of tbe screws the final trial will be made. The Wsrd tuhular boilers in use on this vessel hsve proven very successful.

The Huntington Ore Car.

As mining cars are usually made, the frsme and axles are rigid. There is seldom more than three wheels taking weight at the same time; in fact, two wheels must tske nearly all the weight at all times, unless the track is ahsolutely level, which is seldom the case. A small rock or other obstruction is lisble to lift a wheel on the opposite side clear ahove the track, often causing accidents. The Huntington ore car, illustrated on page 425, is constructed with one rocking axle, so that, like an ordinary wagon, the load is at all times equally distrihuted on all the wheels, thus avoiding derailment, making the csr move easier, and saving the frame from great strain.

This car hss just heen patented hy Mr. F. A. Huntington, of this city, inventor and maoufacturer of the well-known Huntington roller mill. The car will stand or travel on all its wheels irrespective of the unevenness of the track due to obstacles thereon or other causes. The hody of the car is mounted on tbe frame and is adanted to be manipula'ed in the usual maoner. One axle is secured to the frame in the ordinary way. The other axle is connected with the frame by a pivotal joint arrang•d in sucb a msnner that it can rock or tilt in the direction of its length. Tbe result is that no matter how uneven the surface may he on which the car is standing or traveling it will rest or travel squarely on four wheels and can he easily moved, and the load will always be equalized.

It is tbe opinion of Dr. Edward Peters, the copper expert, who went to Australia on the last steamer, that all the accessible copper mines in the Uoited States have probably heen found. A copper deposit cannot keep itself concealed unless it happens to lie at a great depth. Ordinarily it is traced by the stain it leaves on the surroundiog country. The thoroughness with which the United States has been traversed hy mining men and metallurgists leaves little scientific doubt that all existing copper mines lying anywhere near the surface of the ground have been opened up. With due deference to Dr. Peters' opinion, however, it should he horne in mind that there are great areas of the mountainous region of the West which have scarcely heen prospected. There are hundreds of places where copper stains and indications have been noted, hut which have never heen prospected simply because they are too distant from railroads, etc., to make it worth while to bother with them for the present.

MINERAL EXHIBIT. — Secretary Thompson of the World's Fair Commissin has received notification that the allotment of space has heen made for the California mineral exhibit. The space is on the ground floor and occupies a desirshle position, fronting the central aisle, and is 60x37 feet, thus aggregating 2220 feet. Many gentlemen interested in mining have promised to loan their cahinets, and the State Mining Bureau will contrihute largely to the display.

CRIPPLE CREEK, Colo., is strictly a gold camp. The district is about six hy twelve miles and mining and prospecting is going on all over the district. The lesds range from three to twenty feet in width, and the general average of the ore is from $16 to $20. There are five or six mills in operation, and a number of others are being put up. Two railroads will he completed to the camp hy March. The camp is located eight miles from Pike's Peak, and ia best reached from Colorado Springa.

Mining Briefs.

ACTIVE work has been resumed on the famous Keystone mine, Amador county.

FIVE HUNDRED AND NINETY-TWO delegates attended the El Paso Silver Convention, representing 24 States and Territories.

OUR exchanges contain numerous accounts of good strikes beirg made in doing assessment work on claims this winter. That's the way to make strikes on clsims; do some work on them.

THE Nevada county *Transcript* says that the mines of that district are looking well at present. In three of them the ledges are larger and richer than ever known before, and this month's shipment of gold from them will exceed any previous month.

DIAMONDS are supposed to he among the other valushle products of Inyo county, and it is whispered that a prospecting party will soon make a thorough investigation. Tbey are found in several parts of California, but so small as to he of no commercial value.

THE stockholders of the Idaho Quartz Mining Compaoy, of Grass Valley, have held their annual meeting and re-elected the Bosrd of Directors, as follows: Edward Coleman, John C. Coleman, Eugene C. Oreller, George W. Hill and Myles P. O'Connor. The Board organized hy electing Edward Coleman, President; E. C. Creller, Vice-President; George W. Hill, Secretary; J. C. Colemsn, Treasurer. Edward Coleman wss elected superintendent.

MR. GUY H. REYNOLDS, superintendent of the Cave Creek onyx mines, Arizona, stopped work on the mines until April, professing to believe that the incoming administration will reduce the tariff on onyx and thus close its mines permanently. Perhaps a hetter reason for closing down was tbe severe winter weather in the Cave Creek region. It will he time enough to quit mining for onyx when tbe foreign material crowds out the home product, or is placed in a position to do so.

THERE is little doubt that the finds in the gold fields in southern Utah have been exaggerated. Some California miners who were smong the first to go on have returned to Albuquerque. They think there is gold there and that it will eventually become a good camp, hut all those who are now rushing in expecting to gather up gold by hsndfuls will be seriously disappointed, and very hard times are in store for them. There are at least 1000 men already in the new camp and practicslly nothing is heing done except hy tbe Arizona and Utsh Mining Company, which has located all the best ground. The westher is cold, provisions are enormously high, and, although a color can he found anywhere in the sand, a msn cannot pan out half enough to pay his hosrd. Hundreds of people now there are anxious to work for the company, doing the most disagreeable kind of labor at very low wages to get enough to take them home. There has already been a fight over claims in the district, during which several men were killed. George Ferguson, an old prospector, and James Cody, known as "Blind Jim," one of the hest known chsracters in Arizona and New Mexico mining camps, were among the slain. Numbers of men are still going into the new fields.

Coast Industrial Notes.

THE had weather has interfered considerably with the construction of the Alameda electric railway, hut the projectors say they expect to have the Santa Clara avenue and Park street lines running by electricity as early as April 1, 1893.

THE last seven of 265 cases of machinery for the new jute mill at San Quentin, which arrived on the British ship Formosa on December 1st from Liverpool, were shipped across the bay last week. The value of the machinery is $25,000.

THE San Francisco Ship Caulkers' Association has elected tbe following officers for the ensuing term: President, James E. Connolly; Vice-President, John Comyns; Secretary, Thomas F. Mangan; Treasurer, Lawrence Comyns; Sergeant-at-Arms, John Roherts; Trustees—Rohert T. Delano, Henry P. Sexton and Stanford M. Taylor.

WILLIAM L. MERRY, A. B. Field, C. H. Haswell, Jr., J. J. Moore. H. Bendel, William Thomas and Frank Datton are named as directors of the North American Navigation Company, for which articles of incorporation were filed on the 22d inst. The object of the corporation is to carry on the business of common carriers hetween San Francisco and Panama and elsewhere. The amount of capital stock is $3,000,000, divided into 30,000 shares.

THE Street Committee of the Board of Supervisors has agreed to report in favor of the final passage of the Le Roy railroad franchise for a road on Montgomery avenue, from Kearny to Powell streets; Mason street, from Bay to Jefferson and Powell; Bryant street, from Twenty-sixth to Precita avenue; Twenty-sixth street, from Folsom to Howard; San Bruno road to the county line; Post street, from Broderick to First avenue; Broderick street, from Ellis to First avenue, etc.

A MEETING of about 50 sub-contractors and material men was held in the rooms of the Builders' Association this week to decide upon an amendment to the mechanics' lien law whereby an employee or sub-contractor may be protected against loss. After much discussion it was decided to suggest an amendment to the law at the coming session of the Legislature recommending that contractors furnish bonds for half of the value of contracts they take. By this means it is believed employees will be assured of receiving wages due them.

A FEW miles up Ventura avenue, from this place, says the *Ventura News*, is said to exist a fine deposit, or several of them, of pottery clay. A clay so fine and so pure as to he equal to the hest of that article, used in making earthenware, crockery, and kindred nther articles sn much in use. It is so plentiful that the wonder has been expressed that some one of enterprise has not taken it in hand long before this, and turned it to account. A great industry could be started here that would give employment to many men and draw much capital to this place.

THE Chamber of Commerce of Phoenix, A. T., will hold a meeting at an early day to confer with a committee of 100 appointed by the Chamber of Commerce of San Diego relative to a proposed railroad between the two points. It is proposed that the new road cross the Colorado at Yuma, and come by the Harqua Hala gold mines of Arizona. By the existing law of Arizona the road would be exempt from taxation for twenty years, and as soon as the Territory is admitted it is proposed to bring a pressure to bear on the Legislature for a honus. Prominent Denver men are interested.

THE California Sash, Door and Blind Company, the largest establishment of the kind on the Coast, is located at West Oakland. It has an office and salesroom in Oakland as well as in San Francisco. Its warehouse is at the factory, from which stock is distributed. A side track runs to the rear of the factory. A second story is being added to the brick warehouse, which is to be 222 by 56 feet. The site at West Oakland was selected from many offered as best suited for the purposes of manufacture and the facilities for receiving material and the distrihution of the articles manufactured.

ARTICLES of incorporation have been filed with the Secretary of State for an electric railroad to run between Pacific Grove, Monterey und the Hotel Del Monte, a distance of ahout five miles. The name of the corporation is the Pacific Grove, Monterey and Del Monte Electric Railroad Company. This company has bought up the rights and privileges of the old Monterey and Pacific Grove Horse Car Company, owned by one Juan Malearin and purchased of him for $75,000. The members of the present corporation own the Electric Light and Power Company and consist of J. T. Macrossan, secretary and treasurer of the Atlas Iron Works; H N. Bryant, manager of the Bank of Pacific Grove; A Barnard, connected with the Title Abstract and Trust Company; Montford W. Bell, secretary of the Carnall-Hopkins Company; William H. Chapman, an attorney of this city; and George W. Hopkins and Nathan C. Carnall, of the above-mentioned real-estate firm. The president is J. T. Macrossan, William H. Chapman secretary, and George W. Hopkins treasurer. Ten per cent ($50,000) of the capital stock has been actually paid in. The promoters intend to have this line running in about three months.

THERE is a steady increase of the freight shipments at the Sixteenth street station in Oakland. That city is now a terminal point on a par with San Francisco in the shipping of freight. Goods are coosigned direct and delivered to Sixteenth street in car-load lots or by special arrangement heavy freight is landed at Market street by the broad gauge and the narrow gauge freight is delivered at Fourteenth and Webster streets. To and from San Francisco freight is principally transferred by the creek boat from the Broadway and city wharves and by the narrow gauge ferry. The business at Sixteenth street has necessitated an enlargement of the freight depot within a few years and an increase in the clerical force. There is a considerable amount of car-load freight consigned to Oakland merchants, also frequent shipments from the city in quantity. The facilities for the local transfer of freight are first-class and capable of still further improvement as demanded. The railroad tracks skirt the city on the west hay shore, along both sides of the estuary on the south and with the narrow guage to the heart of the city and the Livermore branch by East Oakland with the Y to Alameda from Fruitvale it is possible to put freight down at almost any part from Berkeley to Fruitvale. The tracks out upon the old Long wharf bring the freight train alongside ot the ocean-going ship, and it is only a matter of time when other piers will project into the hay from the west front of the city. The wharves along the estuary accommodate the hay and coasting commerce, and the Government improvement will eventually give a depth of water sufficient to accommodate clipper ships and other ocean carriers.

Personal.

JAMES L. FLOOD, the Comstock mining magnate, has gone to New York for a brief visit.

W. H. WELDIN has resigned as superintendent of King Solomon's Mines, Grass Valley, and Charles Brookington has been elected to fill the position.

WM. P. HODSON of Shasta county, who has been some weeks in San Francisco arranging about the mineral exhibit to Chicago, has returned to his home at Redding.

CHAS. M. CLARK, World's Fair commissioner for Yavapai county, Arizona, is urgent in his appeal to the miners of that locality to make a creditable exhibit of ores and minerals.

DOUGLAS L. V. BROWNE resigned as general manager of the Rico-Aspen Consolidated Company of Rico, Col., but has been appointed consulting engineer of the company with headquarters in Denver.

WM. A. HANLEY takes the place of superintendent of the Brunswick mine, Grass Valley, vice Manager Fitzgerald, resigned. The Brunswick belongs to a New York company. Mr. Hanley is an accomplished millman.

JACOB Z. DAVIS, trustee of the State Mining Bureau, returned on Tuesday evening from a two months' eastern trip. During his absence Mr. Davis secured a number of exhibits for the bureau which will he placed on display within a few days.

ALF TREGIDGO is stirring up the Nevada county miners to make an exhibit at the World's Fair. He guarantees that each and every exhibit will be properly cared for, and at the close of the Fair returned to its owner or owners. Transportation for the ores will be furnished gratis, and there will be no cost whatever to the contrihutor.

National Forestry.

LAMANDA PARK, LOS ANGELES CO.

TO THE EDITOR:—National forestry is based upon two grounds—first, the advantage of maintaining forest production by the cootrol of forests by an undying corporation like the State. Uoder this head come the prevention of waste, the prevention of fire, the regulation of ripe timber-cutting and provision for the reproduction of the most useful forest growths. A forest management with this object alone would also have to arrange for the exploitation of all the resources of forest lands, other than forest products themselves. These interests would comprise water developments, reservoirs, mines, quarries, game, fish, travelers for health or pleasure, and, in places, pasture.

The object of regulating these last uses of forest lands would not be to curtail or vex them, but to prevent useless waste and destruction of the forests by carelessness and fire.

The reason that national forest management is advantageous to secure a continued supply of lumber and other forest products, is that private or even State management cannot give a uniform system or a uniform protection, nor consider the forests from any better point than a narrow and purely individual or local one.

Thus, in individual or State ownership, a good system adjoining ao indifferent or a bad one would be constantly subjected to the dangers ot trespass, depredatlon and fire growing out ol the bad one. So, also, a system in regard to some particular forest product, like tar, might be good policy, give returns and maintain product, if uniform and general, while it might, and probably would, be both costly and useless if individual or local.

Besides this, a national system would necessarily consider the forest from a wide and general view as to locality, product and time.

As to locality, a national system would consider, for instance, the interests of Dakota, Nebraska, Missouri and all the States upon the water system heading in Dakota. An individual system would not consider such interests at all. A Dakota system would only consider Dakota and pay no heed to the other States.

As to product, an individual system could only consider individual interest; a State system could only consider State interest. In neither case could national and general interests be provided for.

As to time: The most important forest product, lumber, requires a very long period of time to come to its highest economic value. One, two and often three or more generations must be born and die before a forest comes to maturity. This fact makes it plain that no individual system can ever adequately provide for the reproduction of forests. To secure the reprodnction of the most valuable timber requires scientific management covering many years of intelligent and watchful care.

That this care pays handsomely we know from the returns of national forest management in Europe, but individual interests, especially in this country, even if capable of a uniform and broad policy, can never be expected to expend care and money for rewards to be enjoyed only by generations yet unborn.

While the first ground for a national forest management is important, the second is essential.

The second ground for a national forest system is based on the demonstrated necessity for the maintenance of a certain forest area to secure the highest agricultural product from any given territory, and, second, on the demonstrated necessity for a certain forest covering on watersheds. The first base is due to the influence of forests on winds, frosts, climatic extremes, and on their probable effect on the character and distribution, if not on the quantity, of the rainfall. The second base is due to the influence of forests on the delivery of rainfall into springs and streams. As any watershed is forested, so is the delivery of its rainfall affected. If it be adequately forested, the rainfall will be detained and seep into the ground to appear in the springs and streams in a perennial and even delivery. If it be denuded and bare, the delivery of the rainfall will be short in time and floodlike in character. The watercourses in such districts always are of torrential character. The rainfall tends to become diluvial in character and its delivery is so in fact. The water delivery is alternately dangerous in its excess, in its detritus-carrying and detritus-dnmping, and in its erosive power, while the sudden flood flow of the rains precludes the possibility of a perennial supply. The water is gone and the stream bed is now a raging torrent, and now a dry and arid waste. Irrigation, domestic water and the value of streams for navigation are all diminished or destroyed by an undue denudation of the watersheds.

Iteratioo has worn through the shell of prejudice and indifference, and, reenforced by actual recent and recurring experience, has made California a community demanding immediate forest protectioo for its watersheds.

We favor the Paddock forest bill. At the same time we would have preferred our own bill introduced long years ago, which provided for the withdrawal of all Government lands in forest and for a system of management of the same. The Paddock bill is probably a more practicable measure. It provides for the management and care of forest reservations made and to be made. It consequently looks to a policy of initiative and growth and avoids the difficulty of creating suddenly a large forest force and changing all at once the entire neglect of, and freedom for depredation and waste in, the Government forest laods. On the other hand, every day that passes reduces the Government forest holdings and increases the waste due to carelessness and fire. The situation reminds one of the Roman legend of the Sibylline books.

Whatever defects the Paddock bill may have, it is good—doubtless the best we can now expect—and should be heartily supported. ABBOT KINNEY.

The Grain in Fireclay.

Clay, notably fireclay, in every respect resembles very closely the fundamental and natural principles of oxides and ores of metals, and maintains the same characteristics with remarkable relations all the way through its formation after manufacture. But the closest of all metals of which it assumes similarity is iron.

For example, says the *American Gas Light Journal*, iroo ore ground and smelted and cast loto pig metal is short or brittle, not having any particular grain, except slightly lengthwise the way the metal flows in casting. If this same pig metal is reheated into a workable or pliable condition, and put under rollers and for a number of times rolled in the same direction, then by the compression the crystals, which, in dimensions almost equal in every direction, and joining only at geometrical points, are first flattened and theo drawn or pressed oblong. The process of cooling again acts upon them to slightly separate the crystals, but leaving them in groups closely adhered to each other, and wherever these breaks or contraction cavities occur there will take place a sliding of the particles upon each other in the process of rolling.

The effect of this is that the construction of the original pig metal, which appears very much like compressed salt, becomes a series of fibrous formed material, overlapping each other like brick masonry, excepting that the longitudinal sections are probably hundreds of thousands of times smaller in diameter.

In many instances the formation of rolled iron may be compared with oak timber in its formation of grains or fibers which has at the same time throughout its longitudinal structure a large amount of cross fibers.

Comparing the same with the continuous workiog of the clay into one direction produces the same effect of forming a fibrous grain, as can be seen in a bar of rolled iron. For instance, take a sewer pipe when it first comes from the press; it would be difficult to tear it sideways, while it can be torn into small shreds lengthwise the course it passed through the die. The same with a brick being made on a spiral or plunger brick machine. If the brick is an end cut, it will be almost impossible to break it evenly crossways, while there would be but little trouble to split it lengthwise into any number of parts. Therefore, in bricks which are expected to carry much transverse strain, the lengthwise grain is much preferable over all others.

In the forming of grain in clay, water plays a very important part. As the wedging of the clay goes forward, the molecules of clay become closer attached to the moving particles, and the water and air find their way into the horizontal layers, forming the lubricator between the stratas.

This is easily witnessed by a simple practical experiment. If a block of plastic clay of about 25 pounds be taken and rolled for several times in one direction, forming the grain in length, then the block set on end, and slabs cut from it about one inch thick, will make tiles about 9 inches by 9 inches by 1 inch in size. If these are put to dry, the probability is that about 90 out of 100 will crack through the middle, the same as if a slab be cut off the end of a log crosswise, which would be sure to go to pieces before it became dry.

On the other hand, if the clay slabs or tiles were cut from the side of the former mentioned blocks, the effect of rapid drying would simply be warping, the same as a green board would turn up if placed in the sun.

To produce the best effects or results we must comply with certain natural laws, suitable to the material we want to manipulate. Many clay workers worry themselves, and do not understand why their bricks or materials crack all to pieces. We would say, study the geological and chemical formation of the raw material first, then the technical working, and the result will be satisfactory.

EX-SUPERINTENDENT RUTHERFORD of the Berkeley system of street railroads states that the Southern Pacific Company is making arrangements to build a cross-town electric road. According to Mr. Rutherford the plan is to build an electric road from Twenty-third avenue along Twelfth street to East Oakland. The company would then move the Sixteenth street station to the terminus of its own electric road, and thus shut out the two electric roads which now have their termini there. Then the company intends to extend its local steam system to Fitchburg, where it has been buying property lately. A local service will be kept up from that point to compete with the Haywards electric road; which has been cutting into the travel of the Southern Pacific recently. The loop system proposed at Fitchburg will probably not be carried out. The trains will be run there on straight tracks. The Southern Pacific owns the horse-car line from Twelfth street and Broadway along Twelfth street to Thirteenth avenue in East Oakland. The line is a short one and is paralleled on both sides by electric roads. The horse-car line is therefore practically useless, and at the present time hardly enoogh money is taken in to pay for the feed and keeping of the horses. The franchise, however, is a good one. If an electric road is to be built, as stated by Mr. Rutherford, the corporation will have to secure a franchise from Thirteenth avenue to Twenty-third avenue, and from Broadway to West Oakland. The company would then be in direct competitlon with the Haywards line for the local patronage. Others now hold a franchise for a street railway from Broadway along Twelfth street to West Oakland, but no steps have yet been taken to build the road. This new electric road relieves, to a considerable extent, the pressure of travel on the Seventh-street system. It is intended, so it is stated, to sell commutation tickets on the Twelfth-street road that will take the passenger to San Francisco by way of the Sixteenth-street station.

THE modern passenger locomotive for high-speed trains is capable of developing at least 1200 horsepower, and costs abcut $10,000.

The Study of Living Protoplasm.

In biology the study of life in its simplest manifestations continues to attract the attention of many investigators, and important progress is being made. Dr. W. Flemming of Kiel has a short paper in the *Anatomischer Anzeiger*, In which he combats the idea upheld by some authors, that the well-known network observed in the nucleus of certain cells is a false appearance due to accidental and secondary changes in the material during preparation. Dr. E. G. Balbiani has studied the nucleus from another point of view, namely, in reference to its influence on the growth and reproduction of the cell. Dr. E. B. Wilson has been experimenting on the developing egg of *Amphioxus*, tearing asunder the segments at various stages in the subdivision, and trying the effect of allowing these parts tn continue their development separately.

Dr. Balbiani's investigatlons were conducted by cutting up the protozoan *Stentor cœruleus*, and observing the process of regeneration in the various pieces. He finds that wounds are soon obliterated, and that each fragment becomes a new *Stentor* whether or not a trace of the nucleus happens to be preserved. The merest trace of a nucleus accelerates repair, but, at the same time, the effect of its total abseoce is not appreciable until this repair is tolerably advanced. Even when present, indeed, the reconstitution of the nucleus is the last act in the process of regeneration. For the complete restoratioo of all the parts, hnwever, Dr. Balbiani finds that the constant presence of a nucleus is essential, and he has often observed the death of incomplete specimens, marked by the spongy character of the protoplasm with water forming numerous small vacuoles. He has also sometimes noticed a curious tendency, during regeneration, to a multiplication of the organism by division, and he believes that the nucleoli are exclusively concerned io sexual reproduction.

Dr. Wilson's results are very curious. If an egg of *Amphioxus* that has just segmented into four parts be taken and subdivided into its components, each will usually continue to develop, and will eventually give rise to an oval, free-swimming larva one-fourth the normal size, but otherwise quite ordinary in appearance. If this four-celled stage be allowed to fall into two pieces, each half not infrequently develops successfully and gives rise to an embryo of half the normal size. Experiments, however, seem to show that if the egg be split into pieces at its eight-celled stage, none of these segments do more than acquire cilia, and swim about actively in their simple state; while, sooner or later, all of them die. The same phenomenon has been observed by Dr. Driesch in Echinoderms.—Natural Science.

STEEL PAVING IN CHICAGO.—An ordinance for paving Dearborn street, Chicago, between Monroe and Madison streets, has recently been passed, that provides for the laying of wooden blocks on a steel base. Above a thick stratum of sand there are laid solid steel plates. They reach from curb to street-car track and are a half-inch thick, perhaps thicker. Rising from this solid plate to the height of two inches are steel tongues an inch thick, securely bolted to an underlying plate, and running from curb to street-car tracks. Grooves are sawed in the bottoms of the blocks, and they are fitted snugly on over those tongues. Every block is thus securely fastened in place. As they are oblong blocks with sharp corners and fit closely together, being held by these tongues firmly at the bottom and supporting each other, being fitted in closely, it looks as if it would form a durable pavement. The blocks are of wood, eight inches long by four wide and six deep. It would form perfectly level paving, and wonld be noiseless. The inventors of this new style of pavement have great confidence in it, and have offered to put it down for experimental use, and only in the event of a two-years test proving satisfactory are they to be paid.

THE Leach flume, Butte county, was badly damaged by the recent storm, and the citizens of Honcut, to prevent the busioess going from there, intend to rebuild. The flume runs from Wilsons Creek to the mill at Honcut. The cost of labor on that portinn of the flume was estimated at $2000, and a guarantee for $1200 worth of labor has already been given. This flume has been a great benefit to the residents of Honcut, as it gives employment to about fifty men, supplies many with water, and enhances the value of property. The flume is owned by the Leach Lumber company, and is being run in the interest of the Honcut Lumber company. The engineer's estimate of the cost of repairing the damage to the entire flume has been $7500. The labor to be performed by the citizens will amount to $2000, and the company will complete the balance of the work. They will have to put in about 368 boxes, but will be able to use some of the old timber to advantage. The lumber company does not feel justified in standing the full burden of the expeose attached to the repairing of the flume, and for that reason the residents of Honcut have determined to repair the flume at the lower end.

AT Butte, Montana, on the day before Christmas, the Anaconda Mining Company laid off 600 meo, the entire force that had been working in the Anaconda and St. Lawrence mines. All work was suspended in the Chambers syndicate mines three weeks ago so that this action practically shuts down every mine operated by the Anaconda company. No more ore will be shipped to the smelters for about thirty days. The smelters will continue to run on the ore reserve in the bins. Manager Daly gave it out that the suspension was for the purpose of retimbering the shafts, and that the copper market or copper combine had nothing to do with it.

A MONOLITH weighing 600 tons has been detached from its bed in the quarry at Houghton, Mich. Fifty workmen drove their wooden wedges simultaneously until a crevice appeared in the base of the stone.

Squares and Square Roots.

TO THE EDITOR:—This method may or may not be new; it is not commonly known, and the principle has its merits, especially in certain cases. The fundamental equatinn is, $a^2 - b^2 = (a+b)(a-b)$; that is, the sum of two numbers, multiplied by their difference, equals the differeuce of the squares of the numbers.

Let us find the square root of.....11, 90, 25

30	900	
Sum × dif.	256	to add.
340	115600	
Sum × dif.	3425	to add.
345^2 =	119025	

What is the square root of.... 20

40	1600	
Sum × dif.	336	
440	193600	
Sum × dif.	6209	
4470	19980900	
Sum × dif.	35776	
4474	20016676	
Sum × dif.	8947	subtract.
4473	20007729	
Sum × dif.	8945	subtract.
4472	19998784	

We see that 4.474 is too large, and 4.473 is also too high, while 4.472 is a little too low, but near enough for most purposes, and a closer approximation could be got by carrying the work to another decimal place.

The method admits of working either up to a higher number or down to a lower one for the root, as shown in the last example, and it will be seen that, when the roots change by 1, the difference of the squares changes by 2; hence, in working by changes of 1 in the root, having done that once, we need not take the trouble to add the roots together in order to find the amount to add to, or subtract from the last found square, but simply to copy the last previous difference, plus or minus 2, as the case may be. In like manner, if the numbers (ronts) differ by 10, the difference of the squares increases or decreases by 200, and so on; this has its use as follows:

For any series of numbers increasing in arithmetical progression, the difference of the squares increases by the amount of twice the square of the increase of the number: $(a+2x)^2 - (a+x)^2 = (a+x)^2 - a^2 + 2x^2$.

Find the squares of 274 and of each of the three numbers next above and below it.

$274 \times 274 =$	75076	
		dif. 547.
273^2 $274^2 - (274+273) =$	74529	
		dif. 545.
$272^2 = 273^2 - (547-2)$	73974	
		dif. 543.
$271^2 =$	73431	

$274^2 = 75076$

dif. $= 549 = 274^2 - 273^2 + 2$.

$275^2 = 75625$

dif. 551.

$276^2 = 76167$

dif. 553.

$277^2 = 76729$

Conversely, if we have a series of numbers of which the differences uniformly increase or decrease by 2, 200 or 20,000, we need only to extract one root and we obtain the others by adding or subtracting 1, 10 or 100, as the case may be.

Another fact which is of some slight use is, that the right-hand figure of a perfect square always corresponds to one of two figures at the right hand of the root, except 5, which is at the right of both, thus:

Number ends with	Square ends with
1 or 9	1
2 or 8	4
3 or 7	9
4 or 6	6
5	5

In the first example, having found 3 and 4 as root figures, we know that the last figure must be 5, if the number is a perfect square; hence we try 5, and, if it does not fit, we know that the number is a surd, and we must work to decimals, if closer approximation to the root is desired.

To extract the square root of a number:

RULE.—Mark the number off in periods, as usual. Select a number in one, two or more figures, as a trial root. The number may be too large or too small; square it and set the square down toward the right. If it is less than the given square, set a larger trial root under the first, add the two together and multiply their sum by their difference; add the product to the square of the first trial root. The sum is the square of the second trial root.

If the figure added to the trial root is in the next term, affix one cipher to the root and two ciphers to its square, as shown in the first example given.

If the square of the trial root is too great, set a smaller trial root under the first, add and multiply as before, but subtract the result from the first square, as seen in the second example, where both of these resources are applied. C. H. A.

Progress of Fuel Oil.

The character of the petroleum found in California makes it specially useful as a fuel oil, and only in a few instances have "green" or lubricating oils been found. In the southern portion of the State, where most of the oil is produced, it is largely used as fuel. As coal is expensive here, California producing very little, the oil is destined to come into even more general use for fuel than at present. It is interesting to note the increasing use of oil as fuel in Pennsylvania, the greatest producer of both coal and oil of any State in the Union. The *American Manufacturer*, of Pittsburg, says: "Industry after industry, plant after plant, is introducing oil as fuel, and this is not restricted to localities where coal is expensive and oil is cheap, but the Pittsburg district, where coal is so plentiful and oil has to be piped some distance is in nowise behind in the adoption of fuel oil. An interview with Mr. William T. Eyer, of New York City, representing the fuel-oil branch of the Standard Oil Company's business, shows the increasing popularity of the new field. Mr. Ayer said that it must be understood by manufacturers that oil must be used properly in order that it may be used economically. By properly is meant with the appliances that have been invented for its use after great study, and which ample experience has proven to be successful. Oil can be used in such a way as to occasion an extravagant waste, and then again, with the proper appliances, may be used in such a way as to get the maximum heat from the minimum supply of fuel. This is the fundamental necessity. Without any fuel-saving appliances and devices, and there are a great number of them of more or less efficiency, oil will of course be wasted and its use as fuel be made less economical.

Oil is being used at present, and has been used for several years, in a large number of the largest manufacturing institutions in the United States, embracing almost every branch of industry. The Chambers & McKee Glass Company, at Jeannette, Pa., using a 900-ton furnace, has used oil successfully, and prefer it to any other fuel in flattening. The company claims that the heat is better adapted to securing a superior product. The United States Glass Company's factory at Greensburg, and one of the same company's factories at Pittsburg, are using oil successfully, and it is very probable that it will use oil in its two factories at Findlay, O., the Columbia and the Bellaire goblet works.

New Jersey factories also are using oil. Whitall, Tatum & Co., at Millville, the largest bottle works in the world, are using oil in many of their departments, and they are making some extensive additions based upon the success of oil as a fuel. Oil costs them $1.15 per barrel. The Cohansey Glass Company, of Bridgeport, N. J., the Whitney Glass Company, at Glassboro, and the Woodbury Glass Company, at Woodbury, all use oil exclusively.

The Moore Bros., at Clayton, have put it in their melting furnaces and all through their works. The Riverside Glass Company, at Wellsburg, W. Va., is meeting with the best of results from the use of oil, after testing it for two years. The Illinois Steel Company, although owning and operating its own coal lands, uses 5000 barrels per day for 300 fires. In Pittsburg, oil is selling at 70 cents per barrel, and in New Jersey at about $1.15 per barrel. Oil in Findlay is selling at 50 cents, and is therefore cheaper than at any other place in the world, excepting in the immediate producing district. In the Northwest, one of the large factories using oil is the Cream City Glass Company.

The Libby factory at the World's Fair will use oil as well as the entire power plant in the grounds. The advantages claimed for oil as a fuel are, regularity in the heat, a perfect control of the fire at all times, absence of expense in handling, and economy in all features of fuel consumption. In the iron furnaces, it is claimed that the heat is less harsh and more mellow, which insures a better product. The Chicago Hydraulic Press Brick Works use it in preference to gas. Getting at a ratio between coal and oil is a difficult matter. The quality of coal differs in every section, and of course varies accordingly in the heat-producing power. As near as it can be figured, however, under boilers a ton of coal is equal to three barrels of oil, and under furnaces to less than two barrels. But with the use of oil, the output of a plant can be very materially increased without any additional outlay for boilers, etc. This largely decreases the ratio.

MECHANICS FAIR.—There is much activity being displayed by the management of the Mechanics' Fair and "dress parade" of World's Fair exhibits to be held next month at the Pavilion. Among the new exhibits which space has been asked for, is a complete mining plant on a small scale, showing the process of extracting precious metals from ore. An automatic ore-carrier and elevator, the invention of a young Californian, will be a feature of the machinery exhibit. The exhibits which are made at the Pavilion will be examined by the World's Fair State Commission, and those which are decided to be worthy will be sent to Chicago at the expense of the State. Intending exhibitors should bear in mind that the test of merit rests in the hands of the State Commission. The directors of the Institute have decided to place season tickets for the fair on sale only at the library rooms on Post street. Tickets may be secured by the public at the rates which have generally prevailed: $5 for double season tickets, $3 for single and $1.50 for children. Each purchaser of a double ticket, however, will be entitled to a three months' membership in the library, with all its privileges.

GOLD IN GERMANY.—Gold is obtained as a by-product at ten German smelting-works. Of pure gold there were produced: In 1886, 1065 kilos., worth 2,974.000 marks; 1887, 2257 kilos, worth 6,281,000 marks; 1888, 1793 kilos., worth 5,004,000 marks; 1889, 1958 kilos., worth 5,465,000 marks; 1890, 1855 kilos., worth 5,162,000 marks. A mine worked exclusively for gold does not exist in Germany.

Society of Naval Architects and Marine Engineers.

Some of the most prominent and influential men in the ship-building and shipping interests of the United States, says the *American Machinist*, have completed the preliminary organization of a professional society of high standing, to be called the "Society of Naval Architects and Marine Engineers," whose object will be the promotion of ship-building, commercial and naval; and in furtherance of this object, annual meetings will be held for the reading and discussion of appropriate papers and interchange of professional ideas, thus making it possible to combine the results of experience and research on the part of shipbuilders, marine engineers, naval officers, yachtsmen and those skilled in producing material from which ships are built and equipped.

A society of this character cannot fail to have a great influence on the advancement of ship-building in all its branches. Indeed, it is reasonable to form such a conclusion when we consider the great amount of good that has been done by similar societies existing in England, Scotland, France and other European countries. These foreign societies include among their officers and members the foremost shipbuilders, engineers, shipowners, naval officers, members of Parliament and other public men interested in shipping. Many laws promoting the greater security of life at sea, and general improvement in ocean carriers, were originated by these societies, and the present advanced state in naval architecture and marine engineering is directly traceable to their proceedings and investigations.

In this country, the influence of kindred societies, such as the American Society of Mechanical Engineers, Society of Civil Engineers, etc., has done much toward the advancement of knowledge and the successful solution of many knotty problems which have presented themselves in every-day practice in these particular branches.

Considering our vast seacoast and magnificent harbors, and the abundance of material from which ships are built, in connection with the increasing importance of our shipbuilding interests and the development of the navy, the organization of this society at this time must be regarded as opportune, and as one that will have a valuable and extended field of influence in technical subjects and public affairs, and it will undoubtedly stimulate actual growth by rousing popular as well as professional interest in a branch of industry which should be one of the most powerful factors in the development as a nation.

We append a list of gentlemen who have accepted offices in the preliminary organization, and who have expressed themselves in the most cordial terms as to the expediency and ultimate success of the undertaking: President, Clement A. Griscom, of Philadelphia, president International Navigation Co.; first vice-president, Theodore D. Wilson, of Washington, D. C., Chief Constructor United States Navy; vice-presidents, Charles H. Cramp, of Philadelphia, Pa., president Wm. Cramp & Sons' Ship and Engine Building Co.; Commodore W. Melville, of Washington, D. C., Engineer-in-Chief U. S. Navy; George W. Quintard, of New York, president Quintard Iron Works; Irving M. Scott, of San Francisco, vice-president and general manager Union Iron Works; Francis Walker, of Boston, Mass., president Massachusetts Institute of Technology; William H. Webb, of New York, naval architect. The list of members of council also contains names of many prominent men.

It is proposed to have a meeting of the council in January, 1893, at which time all details as to organization, constitution, incorporation, etc., will be definitely arranged, and the exact date of the first general meeting decided upon. It is probable that this meeting will take place in New York at the time of the naval review, in May, 1893.

We wish the society a complete success in its permanent organization and its future usefulness. All who are in sympathy with its objects, and who wish to give it a hearty support and become members, should send at an early date for particulars to W. L. Copps, Esq., secretary Society Naval Architects and Marine Engineers, 1710 F street, N. W., Washington, D. C.

LARGE DEPARTMENT STORES have ways of their own to force manufacturers of novelties into submission. For instance, if a manufacturer of any good-selling commodity refuses to sell to them with a big enough allowance to enable them to beat the regular retailers, they will buy and sell at regular prices all the rival goods in that line, and sell the goods of the stubborn manufacturer at below cost, giving as reason that the others are superior, and create thereby enough of prejudice to injure his goods. The manufacturer has no way of remedying this, and must come to terms, as the selling below cost of his goods spoils their sale at regular prices at the retailers, and the amount of sales lessens and he must yield.

THE ACADEMY OF SCIENCES.—At a meeting of the Academy of Sciences held Monday evening, the nominating committee submitted the names of the following gentlemen as the regular ticket at the forthcoming election of officers: Pres., Dr. H. W. Harkness; First Vice-Pres., H. H. Bauer; Second Vice-Pres., J. G. Cooper; Cor. Sec., T. S. Brandegee; Rec. Sec., J. R Scupham; Treas., L. H. Foote; Librarian, Carlos Troyer; Director of museum, J. G. Davis; Trustees, W. C. Barnett, C. F. Crocker, D. G. Hayes, E. G. Molera, G. C. Perkins, Adolph Sutro, John Dobr.

VITRIFIED brick paving was laid on 11 miles of streets in Philadelphia in 1891. Most of the brick was laid for light traffic. Lack of uniformity in hardness is the main trouble with the brick. The last report of Mr. Geo. A. Bullock, Chief of the Bureau of Highways, Philadelphia, states that brick pavement costs about 20 per cent less than Belgian block or asphalt, and always presents a non-slipping surface. Portland cement has been substituted for pitch in filling joints, as the pitch always ran over the bricks, making them slippery.

Mechanical Progress.

Pumping Plants.

An expensive blunder in the arrangement of pumping plants which appears to be not uncommon was discussed at the recent meeting of the American Society of Mechanical Engineers. It seems to be a common idea that a pump must not have its suction side under any considerable pressure. In a case cited, the water supply for the pumping station of a town waterworks was piped to the pumping station under a head of about 60 feet. Instead of utilizing this head to assist the pumps, the pipe was allowed to empty into a receiving well at the pump station, and pump suction was taken from this well. The engineer, who had the temerity to suggest that the supply main might be connected directly to the suction with a large decrease in the load on the pump, had a hard fight to get his plan carried into effect. Other cases were reported where large sums were expended to make sumps and reservoirs for pumps to draw from, and avoid placing any pressure on the suction side of the pump plunger. The only reason cited for this wasteful method of working is that the suction valves would not seat, were the suction under a head; but this is apparently pure theory. The real reason, probably, why a prejudice exists against pressure on the suction side of the pump is the water-hammer which is apt to accompany it. This is easily obviated by placing an air-chamber on the suction side, and, indeed, this is a benefit to any pump where the suction main is of any considerable length. The necessity of an air-chamber on the force main seems to be comprehended, but the advantages of a similar cushion on the suction main escape the attention of all but a very few. A large proportion of the troubles with water-hammer in pumps could be obviated by a proper arrangement of air-chambers. That placing an air cushion on the suction is far preferable in point of economy to the frequently practiced plan of snifting in air, or even forcing it in by an air compressor, will hardly be denied.—Engineering news.

Compound Locomotives.

The feeling in favor of the compound locomotive seems to be slowly but surely growing. The German Government has recently ordered four engines of this type and of a new design, namely, two four-axled and two five axled machines, the former to have four cylinders, two at the side and two under the boiler. On the other hand, it is to be noted that at the late international congress in St. Petersburg, MM. Parent and Concanargeres, of the State and Paris, Lyons, and Mediterranean railways respectively, said in substance that the advantages claimed for the compound system had not yet been demonstrated to the satisfaction of all engineers. It was true, however, they remarked, that those in favor of compound locomotives were more numerous than those who were opposed to them, and that the number of compound locomotives in use has augmented in less than three years from about 680 to 1858. The two-cylinder compound locomotives, they explained in detail, increased in number from 522 to 1371; the three-cylinder compounds from 99 to 108, and the four-cylinder engines from 59 to 379. These appreciable developments are to be ascribed largely to the higher steam pressures used. The two-cylinder compound locomotive has met with most favor; but, on the whole, the greatest improvements have been made with the four-cylinder engine. The results of some long-continued tests have practically shown that in countries where coal is cheap the changing of ordinary into compound locomotives, or the building, at the outset, of compound engines is not likely to lead to any advantage. But where fuel is dear, the building of new compound, and the rebuilding of old, single locomotives to work on the compound system, and the adoption of higher steam pressures are advisable. With the two-cylinder compounds, at least, the French engineers stated in conclusion, it has been found that there is no increase in cost for oil, maintenance, etc., as compared with ordinary engines.—Iron.

Objections to Firing with Lima Oil.

Some time ago the Engineers' Society of Western Pennsylvania appointed a special committee to consider the "smoke question at Pittsburgh," and their report was recently submitted. From it we take the following: Lima oil is at present used in various kinds of furnaces, being fed into the combustion chambers by means of air under considerable pressure. It makes an easily regulated, smokeless fire, but has not received much application in Pittsburgh owing to its cost being equal to or greater than coal. Its disagreeable odor is also an objectionable feature. Electricity is proposed for heating purposes, but at present it finds little or no application here. Every city has its peculiar needs and activities which must be recognized in attempting to apply to it general results applicable elsewhere. Of no city is this more true than of Pittsburgh, with its varied industries, its natural resources and enormous production. Hitherto smoke has been the black ensign of the ceaseless warfare carried on here with the forces and materials of nature.

It is estimated that before the introduction of natural gas Pittsburgh consumed about 10,000 tons of coal daily and that the present consumption is about 7000 tons. In Pittsburgh and Allegheny about 25,000 houses are still supplied with natural gas, amounting to several hundreds of millions of cubic feet daily, and probably representing more than half the present coal consumption. If, therefore, our skies are darkened now, what may we expect when the present almost smokeless natural gas fires become smoke producers? Our finest resident district, the East End, will especially suffer by the change. Already, owing to the peculiar topography of Pittsburgh, and in spite of the special smoke ordinance recently passed, the East End is often covered by clouds of smoke, mostly produced in the lower parts of the city. Of the 10,000 houses probably occupying the district, it is estimated that four-fifths use natural gas at present.—American Gas Light Journal.

The Nail Tests.

A short time since it was announced that a test of comparative merits of cut nails and wire nails would be made at the Watertown Arsenal, Mass. The first information relative to this test states that last week quite a number of gentlemen connected with the trade saw the test made. The nails used were selected from market stocks, those of the wire being of corresponding size with the cut nails, both in weight and length, and every detail of the contest was conducted by the committee so as to be recognized as authoritative and absolutely fair. Major Reilly, the commandant, selected these nails and assorted them in packages, each one being weighed and recorded. The size of cut nails ranged from 1¼-inch nails, 3d fine, 764, to 6 inch spike nails, 40d and 60d, 6 to 17 to the pound. The wire nails were secured to correspond as nearly as it was possible.

The packages were made up and sealed and were tested in the order of their sizes, beginning with the 6 cut and 6-inch wire. The tests were for the purpose of demonstrating beyond all argument the relative holding-power when used in ordinary building material. A spruce plank, well seasoned and free from knots, was selected and planed perfectly smooth. Into this the nails were driven, first a cut nail, then a wire nail, the depth being precisely four inches each for the six-inch sizes. Before being driven, they were weighed, and showed a difference of only two grammes, the wire weighing 214 grammes, the cut 212.

The first test upon the machine was with a wire nail, and it required 733 pounds to pull it out. Then the nippers were placed over the head of the cut nail, and on the beam of the indicator was registered 836 pounds. The second wire nail registered 673 pounds, and its equal in a cut nail 742. The third wire nail registered 675, and a cut nail of the same size 804.

The fourth nail tested was pulled out with a pressure of 594 pounds, but it required 964 pounds pressure to draw the cut nail, nearly 400 pounds more. The seventh, and by far the strongest holding nail tested, was drawn with 879 pressure, but the cut nail resisted until 1200 pounds was put to bear upon it. This enormous resistance was accounted for by the nails entering a knot on the inside of the plank.—American Manufacturer.

STEAM PIPES.—At a meeting of the Institute of Marine Engineers of Great Britain, Mr. W. J. Nowers Brett read a paper entitled "Steam Pipes—Their Material, Workmanship and Arrangement." Mr. Brett, in the course of his paper, said that the subject of steam pipes had during recent years assumed great importance in the engineering world, and looking at it in the light of some recent experience in explosions and fractures, he thought it well worth their earnest consideration and discussion. The higher pressures of the present development of the marine engine had caused a certain amount of suspicion to rest upon the brazed-worked copper pipe, and accidents, attended in some cases with lamentable loss of life and injury, seemed to confirm engineers in their opinions as to the uncertainty of the ability of these pipes to stand the more severe test now imposed upon them. In the old-fashioned two-cylinder compound engines the brazed copper pipe did its work very well, and there was no reason why it should not be used for very high pressures with perfect safety. Although brazed main steam pipes were looked upon with distrust, the seam of a good copper pipe properly made was as strong as the rest of the material, and for many reasons these pipes were almost exclusively used in marine practice. An important point in favor of copper as a material for steam pipes was that it could, from its nature, take up the greatest number of small, unknown strains that must occur in ranges of pipes, better than any other material, and thereby give less trouble with the joints.

Scientific Progress.

The Physiology of the Iris.

Some years ago, we are told by the *Lancet*, Dr. Brown-Sequard startled physiologists by stating that the iris responded to the direct action of light, and demonstrated the fact by dividing the eyes of eels and frogs into a posterior and anterior half, and directing a ray of light upon the iris. The contraction of the sphincter pupillæ under these circumstances showed that, at all events, the act was not of a reflex nature through the retina, but it was possible that glanglionic cells might be disturbed in the tissue of the iris, which might be sensitive to light and liberate motor impulses in obedience to that stimulus. Steinach has recently investigated the subject, and by a series of careful observations has arrived at the conclusion that the contraction, of the iris when detached from the retina is due to the direct action of light upon its structure. In frogs kept for some time in a dark cool room, and especially in the brown grass frog (*rana temporaria*), and also in other amphibia and in many fishes, the phenomena may be easily demonstrated even in the isolated isis. He found that no effect was produced by illuminating the peripheral zone of the iris (ciliary region); but it was necessary that the light should fall on the pupillary margin, of which, if only a segment be acted upon, contraction occurs. The contraction still happened when the nervous apparatus of the iris was excluded by the action of atropine. Steinach demonstrates that the contraction is not due to the influence of the chromatophores and entertains no doubt that it is really the muscular fibers of the sphincter that are acted on directly. He has made numerous examinations of these, and finds that in amphibia and fishes they are strongly pigmented. In eyes that have been exposed to the light they are short, thick, and not very well defined, while in animals that have been kept in the dark they are slender and sharply contoured. He regards the presence of pigment in these muscular fibers as the determining cause of their sensibility to light. The several rays of the spectrum are not all of equal power in causing contraction in the isolated iris. In a comment on this paper, Langendorff remarks that other muscle cells besides those of the sphincter pupillæ possess pigment granules in their interior—as, for example, those of the tensor choroideæ in mammala.

IRON-ORE SEPARATION.—Mr. Henry H. Eames, of Baltimore county, Maryland, has patented a process for the extraction of iron from gangues, ores, or sponges in which they exist. The apparatus for the purposes consists of an endless belt or band, which has along its surface a series of conducting strips, and, by means of a series of rollers above and below the band, it is made to assume an undulating, corrugated or serpentine form. This band is placed in an inclined position, so that the ores dropped upon it travel naturally upon an inclined corrugated plane. Means are also provided for imparting to the strips upon the band or passing through it an electric current. Upon this corrugated band the ores or gangues are dropped. The current passing through the conducting strips crossing the same causes the particles of iron on the band to attach themselves to the conducting strips. At the same time a stream of water is directed upon the band, which, being inclined, flows in the direction opposite to that in which the band is traveling, washing back the gold or copper or other metal composing the gangue or sponge, which do not adhere to the metal strips, which continue to flow back until washed off the lower end of the band into a receptacle placed there to catch them. The iron particles continue to adhere to the strips, and travel with them to the other end of the apparatus, when the circuit passing through the strips is broken, and the iron particles fall off upon the ground or into a receptacle at that end.

Oils as Lubricants.

Oil as a lubricant may be considered as being one of three kinds, irrespective of its origin. It may be, says the *Manufacturers' Record*, a solution which will harden into a varnish, like linseed oil; it may be a solution like a paraffine oil, which becomes a wax, or it may he oil continually and under all conditions like the fat oil of lard which hardens into a grease. The varnish oils are not good lubricants under any prolonged test, because they dry at all temperatures and leave the friction surfaces coated with an elastic integument.

Many animal oils are largely charged with a natural gelatine, so that they become hard when dry after a long exposure on a metallic surface, which is little better than varnish. Lard oils have this quality when they are carefully made in so low a temperature that this gum will largely remain back with the solid stearine. The wax olls are inferior to the fat oils, except it may be asserted that they are best where the temperature or the pressure is very great, and even then a long experience indicates that when their tough cohesion is overcome by heat, pressure or dilution, and thus becomes an inconsiderable factor, their value as separating media is probably inferior to the fats.

While the fat oils are eminently safe as separators of surfaces, they are eminently viscid, and develop an immense amount of resistance between their molecules, atoms, drops, or whatever kind of particles it may be that slip by each other when matter is in the fluid state. This viscidity is increased by pressure, cold and evaporation. It is obvious that all the resistance there may be noticed in any machine where the surfaces of the bearings are separated by lubricants which adhere to such surfaces with greater persistency than they cohere together internally is that due to the viscidity of the lubricant.

Sanitary Measures for New York Street Cars.

A report will be presented at the next meeting of the New York Board of Health, advising the discontinuance of textile fabrics as mats in surface and elevated cars. The medical department of the Board of Health has come to the conclusion that the danger of propagating disease in this way is by no means imaginary. By microscopic examination of the dust coming from these mats, it has been found that numberless disease germs are everywhere prevalent in them, and are transported by means of the clothing and dust from the shoes to the living rooms of passengers. In this way every patron is forced to risk his health because of the horrible habit of some person spitting on car mats.

Dr. Bryant of the health board proposes for the present to substitute wooden slats, frequently washed, in place of textile mats, as less likely to carry and retain the infection of tuberculosis, small-pox, diphtheria, scarlet fever, typhus fever and other diseases. It has been shown by Dr. Koch that the sputa of persons suffering from pulmonary tuberculosis was filled with minute organisms, capable, under favorable circumstances, of propagating the disease in persons previously in sound health. Examination of the dust in sitting rooms, has also shown that the microbes of consumption are apt to lodge in places not frequently dusted, such as backs of pictures hanging from the walls. It has been found that the ordinary mode of transference is through the dust brought in on the shoes and clothes of visitors or occupants.—St. R. R. Gazette.

MOST persons would say that the diameter of the largest steamer funnel is four to six feet, and would want to wager that it is not more than eight feet. How far from the actual size such guesses are, may be understood when it is stated that the funnel of the Cunard Liner Etruria measures a little over 18 feet in diameter. At even a short distance away, this can hardly be believed. It gives an idea of the enormous size of the big steamers.

CALCULATIONS based on the observation of the refraction of light have caused it to be supposed that the air becomes so rare at the height of about 60 miles that the distance may be regarded as the limit to its sensible extent, but other calculations, made during the present century, of the distance from the earth at which meteors ignite, indicate that the atmosphere extends to upward of a hundred miles.

LIEBER'S ASSAYER'S GUIDE.

A New, Revised and Enlarged Edition of a very popular book.

JUST READY.

Assayer's Guide; or Practical Directions to Assayers, Miners and Smelters, for the Tests and Assays, by Heat and by Wet Processes, of the Ores of all the principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber, Late Geologist to the State of Mississippi. A new, revised and enlarged edition. Illustrated by numerous engravings.

In one volume, 12mo, 283 pages, price $1.50 by mail, free of postage to any address in the world.

CONTENTS. Introduction. I. Description of the Implements and Utensils used in the Course of Assays by Heat. II. Re-agents used in Assaying. III. Assay of Silver Ores by Heat Cupellation. IV. A Table to Rectify the Loss Incurred during the Silver Assay. V. Gay-Lussac's Process for Assaying Silver Alloys. VI. Assay of Native Silver Ores. VII. Assay of Gold Ores by Heat. VIII. Assay of Gold Ores by Amalgamation. IX. Assay of Gold by Washing. X. Assay of Gold by Panning. XI. Assay of Gold by Combined Dry and Wet Methods. XII. Assay of Gold Ores by a Wet Process. XIII. Assay of Silver Coins, or Alloys of Silver and Copper. XIV. Assay of Gold Coins, or Alloys Containing Gold, Silver and Copper. XV. To find the Proportion of Gold in a Mixture of Gold and Quartz by Calculation. XVI. Assay of Platinum Ores. XVII. Assay of Copper Ores—German and Hungarian Methods. XVIII. Assay of Copper Ores—English Method. XIX. Wet Assay of Copper. XX. Electrolytic Determination of Copper. XXI. Assay of Lead Ores. XXII. Assay of Lead Ores by Heat. XXIII. Assay of Lead Ores by a Wet Process. XXIV. Gravimetric Analysis of Lead. XXV. Assay of Iron Ores by Heat. XXVI. Fuchs's Process for Iron Ores and Iron. XXVII. Swedish Assay of Iron Ores. XXVIII. Assay of Quicksilver Ores. XXIX. Dry Assay of Tin Ores. XXX. Assay of Sulphurets in Ores. XXXI. Mode of testing the Calorific Power of Coal and Other Fuels. Index.

Descriptive circular giving the full Table of Contents of the above book sent free to anyone who will furnish us with his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

NEW DISCOVERY.

Mines Revived and Miners Enriched

By the wonderful **MacArthur-Forrest Process**, Controlled by The Gold and Silver Extraction Mining and Milling Co. H. A. W. TABOR, Pres.; LEONARD GOW, V. Pres.; H. A. JONES, 2d V. Pres.; P. GEO. GOW, Technical M'g'r, and Ass't Treas.; T. L. WISWALL, Gen'l M'g'r. and Sec,v; PETER MCCOURT, Treas.; W. L. COOPER, Eng.

DENVER WORKS: Co the D. & R. G. R. R. near the Broadway Electric R. R. Depot.

TRADE MARK.

(MACARTHUR FORREST PROCESS)

GLASGOW WORKS: The Cassel Gold Extraction Co., Limited, Scotland. Also in Australia, South Africa, New Zealand, Queensland, Etc.

General Office of Company:
Rooms 8, 9 & 10, Tabor Grand Opera House Block, DENVER, COLORADO.

Also mills in operation as follows, viz: The Denver Mill, Denver, Colo.; The Livingstone Gold Mining Co., Boulder Co., Colo.; The Puzzler Gold Mining and Milling Co., Boulder Co, Colo.; The Cripple Creek Gold Extraction and Power Co., Colo.; Calumet Gold Mining Co., Middle Creek, Shasta Co, Cal.; The Shasta Gold Ex Co., Middle Creek, Shasta Co., Cal.; The Mercur Gold Mining Co., Fairfield, Utah; Champie's Mines, Humbug District, Yavapai County, Ariz.; The Crowned King and Last Chance Mine, Yavapai Co., Ariz.; The Union Mines, Maricopa Co., Ariz.; The Revenue Con. Gold Mining Co., Revenue via Norris, Mont.; and others in course of erection.

The object of this company is to introduce the Mac Arthur-Forrest process.

We have purchased from the Cassel Gold Extraction Co., of Glasgow, Scotland, the exclusive right for the United States to use patents covering this process.

If you desire an experimental test communicate with the secretary.

If the results of the tests are favorable, we will then make arrangements to treat a quantity of not less than five tons in Denver.

We are fully prepared to grant royalties to mine and mins owners, or rights covering districts and counties.

The process consists of pulverizing the ores to a fineness of about 50-mesh, and then subjecting the same to an action of a very diluted solution of cyanide. A few tubs especially constructed according to our diagrams, for triturating, settling and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls.

The total cost, as a rule, does not exceed from $2.50 to $5.00 per ton.

The most desirable class of ores for this process is the so-called refractory gold ores, pyritee, bematites, manganese and telturium. We have also treated successfully dry silver ores.

We will be pleased to answer any inquiries and furnish any desired information. Address,

T. L. WISWALL,
P. O. Box 926. Gen. Mgr and Secretary.

Useful Information.

Earthquakes and Building Constructions.

The late seismic disturbance in Japan has caused the Government of that country to appoint a commission to inquire into the best method of constructing buildings so as to render them the least liable to the effects of such convulsions of nature. As was to be expected, that commission has found it to be exceedingly difficult to formulate any hard and fast rule applicable to all cases. It had been anticipated that the commissioners would long ago have submitted their report, and that rules founded upon it would have been in force many months back. But, according to the latest intelligence received, no such report has yet been sent in. Every possible alternative measure had, no doubt, received full discussion, but to each and all of these there seems to have been some serious objection to be taken. The subject has already received wide outside discussion in the public press of Japan, but this does not appear to have aided the specialists deputed to consider it in arriving at any determination. It is well known, observes the *Engineer*, that in all countries liable to such visitations it has hitherto been held to be the chief desideratum to confine the erection of buildings to a single story only. By following this method the advantage is certainly secured of minimizing the disastrous results to an earthquake. But although this is the case, the method gives no assurance against either the destruction of property or loss of life, and it is mainly in the character to be given to the foundations of a building that must be sought the fullest possible immunity against such casualties. As our readers are doubtless aware, most of the dwelling houses in Japan—the country, perhaps, of all others most liable to these visitations—are merely wooden frameworks covered with a material analogous in character with what is known as papier maché. Yet even these light and relatively elastic structures give way by thousands when rudely shaken by the earth waves, and their inhabitants suffer from the dislodged timbers almost as much, if not more than would be the case if the walling of their dwellings had been of solid masonry. The fact would seem to point to the conclusion that the base of such erections must be practically continuous and rigid; that no single part of a building could be affected save in similar relation throughout the structure. Of course, if the base or foundation be of masonry, this, however well bonded, can afford no such guarantee. Theory would, therefore, point to the adoption of the principle of a trussed girder as a sort of base frame on which the walling might be constructed. If this were of metal, laid direct upon the ground, sufficient rigidity could be obtained throughout to insure that the failure of any portion of the earth below it would have no immediate local effect. Until the report of the commission referred to has been made public, it will be impossible to know if any suggestion of the nature we have made now or in the past has been under its consideration, but, although we admit that this might not be applicable to buildings of larger size or massive construction, it would seem to be well suited for insuring a large degree of safety to the majority of native houses, built, as these are, of the light materials we have named. The subject is undoubtedly one possessed of great interest, as also one calculated to exercise alike the utmost ingenuity of engineers and architects.

Pittsburg's Natural Gas Supply.

The cold snap of last week says the *American Manufacturer* demonstrated the fact that Pittsburg's natural gas supply is fully as good if not better than it was last winter. The different gas companies during the past summer have been doing a vast amount of developing, and many managers were found yesterday smiling in self-satisfaction. They report that the number of new consumers who have been added to their lists during the past fall has been fully twice as large as on any previous year since the introduction of the fuel into Pittsburg homes. There are at present not less than 25,000 families in Pittsburg and Allegheny who are using natural gas as a fuel. The cutting off of the many large mills by the different companies during the past year has also increased the supply for the use of the private consumers.

Much of the gas is piped from a long distance, the Beilvernon field, for example, requiring 25 miles of a 36 inch main. The Murraysville and Grapeville fields also require long transportation. There are about 400 wells in the different gas fields, all of which empty their product into the fires of Pittsburg, and there are at least 30 wells now under way which will be turned into the large mains before Christmas time. The Philadelphia Company has at the present writing 220 active gas wells in full blast, and has 15 more almost ready to turn into the main. The various companies are now drawing a good part of their gas from the West Elizabeth field, which seems to grow better as it is developed toward the south. The new Pinhook field has also contributed largely toward increasing the gas supply of Pittsburg for the coming winter, for though it is but six months old there are already about 20 producing wells in the new field. The latest discovery is reported from the new field at Newlinsburg, which is on a direct line between the Grapevllle and Murraysville field. The first gas was struck at that point less than two weeks ago by Duff Bros., who brought in a roaring gasser, situated several miles from the extreme limits of either of the other fields, and so far out as to render the chances of a great extension to the eastward very good. Within the past week half-a-dozen wells have been started in the vicinity of the Duff find, and the Philadelphia Company has already secured 2000 acres of territory and will begin to develop at once.

Spool Making in Maine.

Oxford county, Me., turns out nearly all of the spools on which the thread of this country is wound. The spools, says an exchange, are made from white birch timber, and they are produced by the million in Oxford county. There are many other points in Western Maine, also, where the industry is important. There are many sawmills in that part of the State which are kept busy the year round sawing white birch logs into strips four feet long and from one to two inches wide and of the same thickness. These strips are sent to the spool factories, where they are quickly worked into spools by most ingenious labor-saving machinery. The strips of white birch are fed into one machine, and they are not touched—in fact they are hardly seen again—until the spools, all finished for market, except polishing, drop out by the bushel from another machine several rods away from where the strip started in. The spools get their gloss by being rapidly revolved in barrels by machinery, the polish resulting from the contact of the spools in the barrel.

In the backwoods villages of Oxford county one sees scarcely any other industry but spool-making, and every one is in some way interested in the business. The factories have been eating into the Maine birch forests for years, but there seems to be enough left yet to feed them well for years to come. Hundreds of thousands of feet of logs are sawed into spool timber annually.

Shoe-peg factories are also an important branch of business once peculiar to Maine, although it has of late been followed to some extent in other Eastern States, and is spreading to the hard-wood forests of northern Pennsylvania. Maple is used largely in the manufacture of shoe-pegs, although white birch is used in some factories. Shoe-pegs are sold by the bushel, and are worth from three shillings to $1 a bushel, according to quality. More than $150,000 was received by Maine shoe-peg factories last year for goods.

A curious and profitable business has grown up in the Maine woods about the sawmills, in the utilizing of the immense quantities of sawdust by compression. Thousands of tons of sawdust are pressed into compact blocks and bales, and in this form is finding a ready market for kindling and fuel in the Eastern cities.

GLOBULES.—The taint of milk from sour or moldy ensilage is, it is said, removed by heating it to 130 degrees. The only way to get the turnip flavor out of milk is to heat the milk in a water bath to 135–140 degrees immediately after milking. This will completely eradicate the turnip flavor, and the milk will make good sweet butter. Milk is an animal secretion prepared in much the same way as are the tears, the bile, the gastric juice, the urine, the sweat, and the saliva. It is secreted in the mammary gland, or udder, by certain epithelial cells which manufacture it from the blood. It is well known that milk, especially as it is found in large cities, is usually swarming with living bacteria. Most of these are probably harmless vegetables; nevertheless they constitute a host of organisms entirely foreign to milk itself. The so-called "pure" milk ordinarily obtained in cities, even when it has not been tampered with, frequently contains in a tablespoonful millions of these microscopic vegetables, luxuriantly thriving in a soil most favorable for their development.—Farmer's Review.

People Who Ride.

There is no feature in the problem of rapid transit of such interest as that which relates to the average number of people in various cities who ride in streetcars. Accurate figures on this subject have been very difficult to obtain, owing to the fact that they could only be secured from the accounts of the different roads by special request, and these, as it is well known, are not kept with any idea of giving the statistician or engineer data for his calculations.

It is peculiar enough that the smaller the city or town the fewer are the rides which each inhabitant takes per annum. Doubtless this is owing to the fact that in such places the people are widely scattered and do not appreciate the economy of paying five cents to save five cents' worth of time.

Taking the average of nine towns, with populations varying from 4000 to 18,000, the number of rides per capita recorded for one year was 29, while in New York City the number of rides per capita was 144, or nearly five times as many.

The average for Chicago, Brooklyn and Philadelphia, three of the greatest street-railway cities in the world, by the census of 1890 was 169. As the cities grow nf less importance in point of population, the figures of passenger traffic also grow proportionately less. The average for four cities, with a population of 350,000 to 650,000, shows 143 per capita. Twenty cities, with population from 125,000 to 250,000, give 110. The average of five cities from 80,000 to 100,000 shows 95 rides per annum.

Some idea of the great amount of money that is each year spent for streetcar fares can be obtained with very little figuring. New York City, with a population of 1,700,000, at an average of 144 rides to each inhabitant, alone contributes no less than 216,000,000 nickels, or $10,600,000, into the treasury of the streetcar companies every year.

The elevated roads carried 215,000,000 passengers for the fiscal year ending September 30, 1892.—St. R. R. Gazette.

How Sponges are Gathered.

Arrived at what he fancied may prove a profitable ground, the captain of a sponging schooner sends out a boat to investigate, meantime standing off and on until a discovery is reported. Then all hands, save only the cook, or if she is a large vessel, the captain and cook, tumble into the small boats and the fishing—if fishing it can be called—is begun.

The vessel has towed astern just half as many boats as she has men in the crew, and now two men are assigned to each boat. One of them stands well aft and sculls with a long oar, while the other bends low over one of the gunwales in a most constrained position, and with head buried in a water-glass eagerly scans the bottom as he is moved slowly over it. The water-glass is simply a wooden bucket, having no bottom, that is held an inch or so below the ruffled surface, and these clear waters plainly reveal all submerged objects to a depth of 40 or 50 feet. As a further aid in overcoming ripples or moderate waves, each small boat is provided with a bottle of oil so hung over the bow as to slowly drip its contents into the water.

Through this magic glass the observer sees darting fish, richly-tinted seafans and feathers, branching coral, gorgeous anemones, bristling sea porcupines, and the myriad other curious tenants of these tropic waters. While seeing these he makes no sign, until a small, dark object that, to the untrained eye, differs in no respect from the loggerheads surrounding it, comes within his range of vision. Then, without removing his gaze, he reaches for the long-handled sponge-hook or rake lying behind him, and using it with one hand, quickly tears from the bottom a black, slimy mass that he triumphantly pronounces to be a sheep's wool or grass sponge of the first quality.—Scribner's Magazine.

IN transmitting electric-power from Lauffen to Frankfort, 108 miles, the actual loss of energy was 18 to 20 per cent in the triple process of transforming a current, of from 200 tn 300 HP., into a current of high intensity but small volume; transmitting this current over naked copper wires or ordinary telegraph poles, and finally transforming it again into a current of ordinary pressure. This is the result of an elaborate long-distance transmission test made last October by a committee of experts, headed by Professor Weber of Zurich. This report takes into account an initial loss of 8 to 10 per cent in the generating dynamos, which can be saved by more perfect construction.

Metallurgy and Ores.

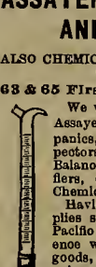
SELBY SMELTING and LEAD CO.,
416 Montgomery St., San Francisco

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

MANUFACTURERS OF
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.
ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,
ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.
63 & 65 First St., cor. Mission, San Francisco.



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

M.C.Co BATTERSEA

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the **Morgan Crucible Co.**, Battersea, England. Also for **E. G. Dennis-ton's** Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Copel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth, 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION — JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

California Inventors should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information.. No 220 Market St., San Francisco Cal.

Electricity.

Candle Power of Search Lights.

It doubtless often creates great surprise among those accustomed to dealing only with lights of from 16 to 2000 candles, to hear that the candle powers of search lights are in the millions and hundreds of millions, and statements to that effect are therefore often thought to be greatly exaggerated. While search lights may be somewhat overrated by the manufacturers, nevertheless their candle power is undoubtedly exceedingly great, and when the conditions are properly considered it is not so very wonderful that they should be so great. With ordinary lamps it must be remembered that the light is sent out in all directions, and that although an incandescent lamp, for instance, gives but 16 candles, it illuminates a large space all around it. If all this light could be collected, as it were, and passed out in one direction, the brightness wuuld increase very greatly. If, for instance, a lamp were inclosed in a hollow sphere one foot in diameter, having an opening in it of one square inch, and supposing it were possible to so reflect the light in the ioterior of the sphere that it would all pass out through this opening, then it can readily be shown that the candle power of the lamp *as seen through this opening* would be 452 times as great as it would be without this reflector. A 16-c.p. lamp would In that case give over 7000 candles. This is assuming theoretically perfect reflection and no absorption losses. If the sphere were two feet in diameter the increase would be over 1800 fold, or four times the former, as the beam of light now has only one-quarter the cross section. But in thus increasing the candle power 1800 times it must be remembered that the space around the lamp which is illuminated is now only one eighteen hundredth as great as it was before. In a well constructed search light by far the greater portion of all the light emitted from the arc is collected, as it were, and is sent out in the form of a parallel beam, and the fact that in the latter case it is so very much more powerful is therefore not surprising. It must furtbermore be remembered that such a beam of light, being composed of parallel rays, does not follow the usual law of decreasing inversely as the sqnare of the distance. If, therefore, such a search light were measured with a photometer at a great distance off, and its candle power calculated as usual, it is evident that the figure obtained would be that for a source which spread its light equally in all directions. It would, therefore, be much greater, perhaps hundreds of thousands times greater than the actual candle power of the lamp. Furthermore it would give a different result for different distances of the photometer from the lamp. While it is, therefore, quite correct to thus state the candle power of a search light, it must be remembered that the light is confined to a comparatively small beam, and that the actual candle power of the arc light by itself is very much smaller.—Electrical World.

Electrical Terms.

We have given in these columns several explanations and illustrations of the meaning of electrical terms by comparison. Mr. R. G. Davis, in the *Marine Review*, treats the subject in the following:

The whole question of electrical distribution may be properly illustrated by its analogy to bydraulics. The dynamo is essentially a rotary pump, but pumping electricity instead of water. If the discharge-pipe of a rotary pump be carried around through a given circuit and connected with a suction, both pump and pipes being full of water, the movement of the pump will obviously cause the water to flow in one direction, producing a continuous current of water. Substitute dynamo for pump, wire for pipe and electricity for water, and conception of electrical transmission by the continuous current is at once clear as to its elementary phenomena. We will bracket the analogous electrical terms; then we may say that a certain number of pounds [volts] of pressure is required to overcome the friction [resistance] of the pipe [wire] in order that the water [current] may flow at the rate of so many gallons [amperes] per minute. The larger the pipe [wire], the more water [current] can be carried and the less will be the friction [resistance]; or per contra, the smaller the pipe [wire], the less the quantity [amperes] per minute and the greater friction [resistance]. Manifestly, the pipe [wire] might be so small that the friction [resistance] would absorb a very large proportion of the power of the pump [dynamo], leaving but little remaining for useful effects; therefore the two horns of the dilemma are: If the pipe [wire] be too large, it will cost too much; if too small, the loss will be too great. The electrical appliances are also analogous to engineering appliances. The switches are valves, the reversible strips are the safety valves, the contacts are the pipe-fittings. If the contact is insufficient to carry the current, there will be a leak [drop] in the current. The volt meter is the pressure gauge; the ammeter is the same as the water or gas meter, the recorder of quantity consumed.

The "Tenderfoot" Engineer.

It is oot in the mining industry alone that the electrical engineer will meet with opposition from those who have gained experience, aided by mechanical devices of long standing. The most satisfactory electrical engineering has been done by men who have been trained mechanical engineers, seasoned with practical experience, who took up electrical work in its earlier stages, believing that such a combination would prove to be of tangible commercial value. That the number of these has been comparatively few, proves that we are creatures of prejudice, and there has been a disposition to scoff at the crude efforts of the young electrical engineer. This hilarity will be short-lived, however. No mechanic has ever passed through an apprenticeshlp without realizing that the path to success is encumbered with artificial as well as natural obstacles. No engineer or mechanic who is baffled by trifles has ever been born. He could not attain such a title unless he was gifted with ingenuity and perseverance, which enabled him to finally triumph. Persistence under difficulties has been a prominent characteristic of our greatest Inventors, and most of our young electrical engineers are by no means deficient in this important qualification. Whatever may be their standing today, they are winning respect, as their works speak for them, and many of them, beginning as electrical engineers, have acquired experience in mechanical engineering which is placing them well at the front as industrial experts. Ten years ago, all electrical engineers were "tenderfeet." With a good proportion, the period of probation has passed, and in a few years the profession will settle down to its permanent stage, in which the yearly increment of students will be but a small fraction of the whole. In that day the value of the experienced engineer will be relatively higher, while the neophyte will be compelled to prove in his subordinate capacity that he has not mistaken his calling. One of the most beautiful provisions of oature is that gradual process by which the perpetual rotation of the innocence of childhood, the vivacity of youth, the experience of manhood and the wisdom of old age unite in producing that variety of life which conduces to the most pleasing results. Modern industrial development is so rapid, however, that we are compelled to submit to the wasteful effects of crude appliances until experience has gradually led up to something better. The situation is hopeful, but we must be patient.

ELECTRICITY DEFINED.—The differeot opinions vary as the shades of colors of a rainbow. These also existed as to the *rationale* of electric agency, but modern science confidently asserts that the old idea of electricity as a "*fluid*" has been *exchanged* by the well grounded theory that It is a latent energy which may at any time be called into action by either cbemical or mechanical means, thus creating in the molecules of matter a modification of motion, which for simplicity has been appropriately termed an "electric current." The production of electrical phenomena may be brougbt about in three distinct forms: Static electricity, or *electricity in rest*, and producible by frictional excitation; galvanic electricity, or the *constant current*, generated by chemical, and possessing important chemical properties; faradic electricity, or *electricity induction* of secondary currents in an adjacent conducting body, by the actlon of the primary galvanic current or of powerful agents.—BLEYER.

STAMPING LETTERS. — An electrically controlled machine which will effectively stamp 30,000 letters in an hour is one of the interesting inventions that has been adopted in the postoffice department. The letters are placed upon their edges in a borizontal hopper, and an ingenious device carries one at a time between two feed-rolls. In this way the first separation is effected. A second set of feeding rolls performs another part of the work. In a simple way the inking rollers are reached, when the envelopes are stamped and passed on, one at a time, to the stacking table. A register shows the number of envelooes canceled. The date and hour in the die must be changed by hand. The various rollers are run by belts, passing over different-sized pulleys, which are in turn connected by gearing to the axle of the motor.

MARINE SET.—The Thomson-Houston Electric Company has designed and brought out a new marine incandescent dynamo, which is designated in electric nomenclature a "marine set," on account of there being a special steam engine built for driving the dynamo, the shaft of which is, so to speak, a continuation of the armature shaft of the dynamo, and vice versa. The dynamo is known at the Lynn factories as the "M. P. 32," being of the compound wound multipolar type, and regulating withio two per cent. An output of 35 amperes of current, at 100 volts potential, the armature rotating at 800 revolutions per minute, with the steam pressure at 100 pounds. The commutator sections are cross connected, so that only two sets of brushes are used. The rheostat, or resistance regulator, is incombustible, while the hearings on the engine and dynamo are self-oiling, with a few sight feed oil cups. The engine is manufactured especially for the dynamo by the Case Engine Company, of New Britain, Conn. The entire set weighs only 900 pounds, and both engine and dynamo occupy a floor space of only 40x20 feet.—Light, Heat and Power.

THE NEXT STEP.—An advance movement in electric-power distribution for which everything appears to be ready is electrical farming. With a power wire running along the turnpike and branches to the several farms or fields, it will be easy to draw the gang-plows and mowing machines, churn the butter and thresh the grain without the employment of the farm horse; and by the same means, with the addition of electric motors to the farm wagons, the produce can be carried to market. The advantages are so obvious, and the adaptability of electricity for the work so clear, that it is only the question of a short time before the thing will be accomplished.

AT Lowell, Mass., a new electric head light is being tried on the cars. It is placed near the top of the car in the center of each end and consists of an incandescent lamp surrounded by a powerful reflector. The light given is strong and strikes the ground 20 feet from the car. It may prove a great advance over the heavy lanterns now in use.

WASTE PRODUCTS.—Some striking facts in connection with the utilization of what used to be called "waste products" are cited in the *Pharmaceutical Journal*. As is well known, the ammoniacal liquor from gas works has been for many years the chief source of ammonia, the annual production of sulphate of ammooia from that material being upward of 100,000 tons. But more recently the llquors obtained in the distillation of shale have been turned to account as a source of ammonia, and more than 25,000 tons a year of sulphate of ammonia have thus been obtained for some years past. The products of combustion from iron furnaces have also been subjected to treatment, by which the ammonia contained in them has been obtained as sulphate of ammonia to the exteot of 6000 tons a year, together with a quantity of tar. To such an extent has this proceeding been carried that in some instaoces the capital expended in plant for that purpose exceeds that devoted to the smelting operations. It is estimated that in Scotland alone nearly half a million of money has been expended in this way at iron works.

WHITING, plaster of Paris, barytes, silica and white clay are the commonest paint adulterants. A recent lecturer showed a number of boards painted with three coats of these materials that had been ground in oil. In each case the grain of the wood could readily be seen, while the coat of white lead was sufficient to practically cover the grain.

IN France there is an unwritten but immutable law that a painting shall not be exhibited without the artists' consent, no matter what the wishes of the owner may be. Aod now a literary and artistic congress in session at Milan, Italy, has decided that the right of reproduction does not pass to the buyer of a oicture.

Complimentary Samples.

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vannere on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentratore and have alwaye found the FRUE in first place. When I built thie mill (20 stamps), I determined to put in six-foot Fruee in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHE. They are taking the pulp from 20 stamps, orushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. Tbey stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for tbe past six months has been too small tomention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and tbe tailings from nothing to 60 cts. per ton. I will conclude by eaying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frne Vanner..... $550, f. o. b.
" " " Improved Belt Frne Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frne Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circniare or teetimoniale, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR.
No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

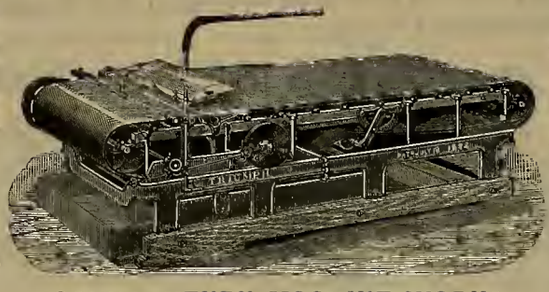
The competitive triale which have heen held between the Triumph" Ore Concentratore, the "Frne" Vannere and other forms of oonoentrating deviose, do not warrant the aeertion that the "Frue" Vanner ie the heet ore ooncentrator in the market. The faot that the "Fruee" have improved (corngated) helte does not militate againet the euperiority of tho "Triumphs;" for, when desired, they (the "Trinmphe") can he mounted with a superior helt known ae the " Blasdel " Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of tbe "Triumph" over tbe "Frue" or any other form of Concentrator, for coin if need be.
Circulare and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blaedel" (riffled Belt are protected hy inconteetable lettere patent, granted hy the Government of the United Statee.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph' Ore Concentratore, tbat four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and tbeir efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At tbe Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my obeervation of their practical workings, I am convinced that this form of Concentratore is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID MoKAY, Jr.,
Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Trlumph" Concentrators were purchased, and twenty-eight (28) are now in constant succeseful operation.

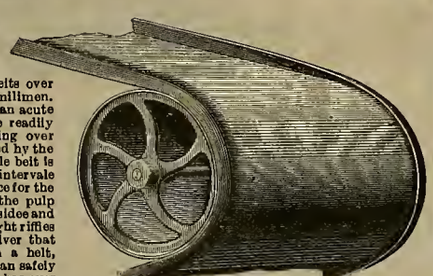
NEW YORK OFFICE, 145 BROADWAY. Cable Address, "UNION."

THE BLASDEL CONCENTRATING BELT COMPANY.

We are now having our new Improved Concentrating Belt manufactured in San Francisco. We keep alwaye on hand Belte euitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flangee or edges of our belt stand at an acute angle inclining toward the centar, and therefore readily conform to the change of direction while passing over the end rollere; tbus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled eurface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sidee and forming channele through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailinge from a belt, the eurface of which ie entirely emooth. We can safely say that it ie a better concentrator belt than has ever been manufactured. It will last much longer and will handle more pulp. We also manufacture smooth belts with same flanges when desired.



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Special attention given to the purchase of Mine and Mil supplied.

Stamp Cam.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

KEYSTONE.—Amador *Record*, Dec. 22: Superintendent Hale on last Monday resumed active operations at the Keystone mine by putting to work 20 miners. The ore house is being filled and the mill will be started up again as soon as some necessary supplies therefor can be received from the East. An additional force of men will be put on soon. With the exception of running five stamps and keeping the water out of the mine, work has been virtually suspended for a few weeks past. This mine is one of the old stand-bys for Amador City, and the people here are much pleased to see the work going on as usual. It is rumored that the Bunker Hill mine folks will pay off their indebtedness at the rate of 50 cents on the dollar within a very short time. As there is a considerable amount due here to old employes and others, the payment of the debts will add to the circulating medium and make a corresponding increase in business all around. There is no doubt, also, that the mine is to be worked again on the old-time scale. Altogether the mining outlook here is very encouraging. The South Spring Hill mine is going along at its usual pace under the able management of Superintendent Tregloan.

THE HARDENBURG.—Amador *Ledger*, Dec. 23: Messrs. Lane & Hayward, of the Utica mine at Angels, are negotiating with S. A. Howland for his bond on the Hardenburg. The prospects are very favorable for their securing the property, the only obstacle being a clause in the bond which the Angels people do not like. The interested parties went below last week to try to have the clause altered. Lane & Hayward propose to put a large force of men to work if they get the property, and make a thorough prospect. Since writing the above, we have ascertained that the Utica people have taken possession of the Hardenburg and are making arrangements to go to work immediately. Knight & Co., the foundrymen of Sutter Creek, have been awarded the contract to overhaul and repair the machinery forthwith. The new managers will sink 200 feet more, running levels, etc., and while the underground work is progressing, they will probably keep the ten-stamp mill running on exposed ore.

THE ALBANY.—The Albany gold mine, of which J. H. Tibbits of Sutter Creek is superintendent, is owned by a California corporation, whose property consists of five claims on the Mokelumne river, near Middle Bar. Mr. Tibbits has ten men at work there at present, and the prospects are very flattering for an increase of the force in the near future. The people at the back of this enterprise have had extended experience in quartz-mining in Amador county, and have great faith in the prospects of the Albany. That business-men of this town and of Sutter Creek have confidence in this enterprise, and in the ability of the able young superintendent, is readily evidenced by the fact that 20,000 shares of the stock have been taken and paid for in these towns.

NOTES.—S. G. Spagnoli, since leaving the clerk's office, has engaged in mining on some of his property near Clinton. He is at present getting ready for work by building reservoirs and ditches. The men on the night shift at the Clinton Consolidated became apprehensive as to their wages, which were due, and quit work Monday night. The day hands went to work as usual Tuesday morning. C. E. Gunn, secretary of the company, came up from San Francisco, Thursday, prepared to pay off the employes, which he will do to-day or to-morrow. Negotiations are pending for a bond on the Good Hope mine between D. Gutmann, capitalist, and Chas. Peters, the owner of the property. The Good Hope is located in Jackson. The Bratiania quartz mine, located at the mouth of Gwinn canyon on the Calaveras side of the Mokelumne, has been bonded to San Francisco parties, who will thoroughly prospect it as soon as the weather will permit. Supt. Chambers, of the Volunteer, expects in a short time to receive instructions from A. P. Minear to put a night crew at work in the mine.

Humboldt.

OIL.—*Western Watchman*, Dec. 24: Last advices from the oil well at Garberville report 1984 feet depth and everything working well; change in formation. Secretary O'Neil has received a map of the well which shows the operations very clearly.

Nevada.

ANOTHER INJUNCTION.—*Herald*, Dec. 23: A writ of injunction has been issued in the case of the County of Yuba *vs.* The Kate Hayes Mining Company, a corporation doing business in Nevada county. The plaintiff asks that a date be fixed for a hearing in the case and that the mine be perpetually closed. C. W. Cross, attorney for the company, has filed a demurrer to the complaint on the usual statutory grounds. The mine, which is located at French Corral and is better known as the Milton, has been working by the elevator process. N. C. Miller is superintendent, and quite a number of men are employed.

KING SOLOMON MINES.—Grass Valley *Telegraph*, Dec. 23: Last evening the directors of the King Solomon Mining Company held a meeting at the Citizens' Bank. Everything at the King Solomon is in good condition, and all machinery necessary for the profitable working of the mine is on the ground ready to be erected. The King Solomon is situated among a group of mines, including the Delhi, Enterprise, Live Oak and Grizzly, all of which are taking out ore and employing from three to 20 men. Under Superintendent Brockington's management we feel sure the King Solomon will come to the front rapidly.

THE BRUNSWICK MINE.—The prospects of this mine have improved very much in the last two months. A fine shoot of ore has been cut in the west drift, 600 level, and good ore also in the shaft and east drift. Sixty-five tons of good milling ore are in the bin and some on the dump. As the ore goes down to the level below, so far as can be seen, it looks like a good milling proposition. We are informed that Major Fitzgerald, the superintendent, resigned this month and a Grass Valley man takes his place. The major deserves great credit for his good, economical management of the property. It was a total wreck when he took charge, and when our reporter visited the Brunswick everything was in first-class order. We are sorry to have Major Fitzgerald sever his connection, as the chances are he would have made a paying mine of it. He intends to stay in the county, as he has interests in mining property here.

GRAVEL.—*Transcript*, Dec. 23: It is reported upon good authority that negotiations are now going on for the sale of three quartz and two gravel mines in the vicinity of Nevada City. A gentleman who is well posted upon what is going on told the *Transcript* reporter that he was confident that from four to six hundred men, in addition to those already employed, would be given work within six months from this time. He tells us that the Fountain Head and Cold Spring gravel mines will be consolidated and worked by San Francisco capitalists. The old Fortuna, Sneath & Clay, the Sharp, and two or three other mines upon which little or no work has been done during the past 15 or 20 years, will be in full blast. This certainly is very encouraging news.

THE NORTH BLOOMFIELD MINE.—The antidebris people are paying particular attention to the North Bloomfield gravel mine since Judge Gilbert of the U. S. Circuit Court, made an order so modifying the injunction that the company can continue hydraulic operations under certain restrictions. To show the condition of the mine and the restraining works that are being provided, the Anti-Debris Association gives the following in address to the people of the Sacramento valley: "The upper mine of the North Bloomfield Mining Co. is located one mile below the town of North Bloomfield, 18 miles north of Nevada City in Nevada county. The company has patent to about 600 acres of ground, the larger part of which will be washed down with the monitors if the company is permitted to work by this process. The banks at the face of the works at the upper end on each side of the Malakoff ravine are in depth from 200 to 250 feet, and as they work to the north and east will increase in dimensions. The serious question which the managers of the Anti-Debris Association are now considering is, what is to become of the vast amount of earth when the reservoirs and restraining works will not hold one-quarter of it with all the capacity they are able to get in the ravine below before reaching the water. To determine what part of this is held in the two settling reservoirs built by the company and how much escapes and finds its way into the river, the representatives of plaintiff Woodruff will have a survey made as heretofore stated to determine what amount is restrained. A brush dam is built across the excavation a little more than half way from the present face of the mine to the lower end, where they first commenced work. Below the dam the excavated space, which has been worked to the bedrock, covers an area of not far from 14 acres, and the average depth is probably from 60 to 75 feet. In the upper part of this lower reservoir, just below the brush dam, is located the crib work, and when this reservoir has been filled to the top of the crib the water will run out through it and is then carried by the flume to the ravine of Humbug creek, thence to the river below. There is another brush dam being built above this one, but it does not cover the entire width of the excavation, yet will, when completed, form a reservoir with capacity similar to the one below. The managers of the mine claim that these reservoirs will hold an immense amount of material, and that while they are at work will, by excavating a large surface, have room to build one or two more of the same kind. The mine, when at work with four large-sized monitors, three of them now being in place at the upper face of the mine, with the usual run of 3000 inches of water, will wash down an average of 10,000 cubic yards of earth in each 24 hours' run. Figuring on the capacity of the lower settler, and it will hold between 75,000 and 100,000 cubic yards of earth, and if we continue the calculation, it is a difficult thing to see where they are to store the accumulation of even one season's run. It is claimed that the first 100 feet from the top down will average from two to five cents per cubic yard, and the second 100 will average from five to ten cents, while the balance next to the bedrock will average from 50 cents to $1.50. A little more than half way down there is a strata of pipe-clay from 70 to 90 feet in thickness, and this is the material mentioned by Judge Gilbert in his decree as "flocculent" and carried in suspension with the flow of water. Alongside of the upper reservoir in the excavation there is a tunnel which is arranged so that the flow from the face of the mine can pass through it and out into the reservoir of Humbug creek and not pass through either of the settling reservoirs. The managers of the mine claim that they do not use this only on rare occasions when the works above get choked up so as to require relief by this source.

The managers of the Anti-Debris Association have doubt about this and say they wish to place a measurement on the works now and another after a run of three months, then they can determine if the mine is being run in good faith and to comply with the decree of Judge Gilbert, and at the same time give the restraining works full credit for what they do.

San Diego.

LITHOGRAPHIC STONE.—San Diego *Union*, Dec. 23: Two specimens of lithographic stone of different texture and color have been left at the Chamber of Commerce by John H. Bunton of Julian. The ledges, from which the specimens come, were discovered in the Julian mining district by Mr. Bunton, and he has sent samples of the stone to the State Mineralogist to determine if it is of the requisite quality for lithographic work. The report from the mineralogist has not yet been received. True lithographic stone is of peculiar textnre, and so far has not been found in the United States, unless the recent finds in Yavapai county, A. T., should prove of value. The world's supply is furnished from Bavaria and is said to be limited in size and quantity.

Shasta.

REID MINES CONSOLIDATED CO. — Redding *Free Press*, Dec. 24: Sam Hendy of the Joshua Hendy Machine Works was in town Sunday, and, along with Colonel Stevenson, visited the works of the above company at Old Diggings. He inspected the new hoisting works just erected, the sorting sheds, and went down the main shaft which is now being sunk on the Spanish claim belonging to the Reid company. Mr. Hendy was highly pleased with all he saw, and gave Mr. Russell, the superintendent, great credit for the workmanlike manner in which the work had been executed. Mr. Hendy and Mr. Stevenson had under consideration the erection of a 20-stamp mill on the Sacramento river, about half a mile distant, beside the Texas and Central mills, on ground which has been bonded by the Reid company. We learn that the directors of the Reid Mines Consolidated Co. propose to use the proceeds on all ore shipped in developments on their extensive properties, instead of declaring dividends at present, and they have accordingly let a contract to build a wagon road from the Spanish shaft to the Sampson tunnel, and have also contracted for completion of the Sampson tunnel to the main ledge of the mountain, which is expected to be reached in another 200-foot tunnel. The mill belonging to the Reid company on the other side of the mountain is being run on ore from two ledges on that side, with what result we have not yet learned. Every indication goes to show that this immense property will prove one of the most valuable in the State. From a recent assay made by Prof. Price of San Francisco on a piece of quartz, with sulphurets taken from 80 feet depth in the main shaft, the assay showed: Gold, $1385.01; silver, 115 ounces; total, $1500.01 per ton. The same kind of rock at 60 feet depth in the shaft gave by Falkman's assay $603 per ton, showing that the sulphurets are increasing in value with depth. These pieces of rock were half quartz and half sulphurets, so that the pure sulphurets would go double those amounts. The visible gold in the rock is becoming more pleotiful and coarser.

CROWN POINT MINE.—It has been some time since Mr. Parker of the Crown Point Mining Company started his crosscut to tap his ledge on Mule mountain, and he has been working under many difficulties. But early this week he encountered a well-defined ledge about 200 feet from the commencement of the tunnel, and about 156 feet from the surface of the ground. On December 17th he made the strike, encountering ore which assays all the way from $50 to $500 per ton. The rock shown us was certainly well mineralized, and Mr. Parker states that he is four feet into the ledge, and, from the indications, not half through yet. When he cuts the ledge entirely he proposes to drift north and south, and also run an upraise to connect with a shaft down some 80 feet, shipping the best ore to Linnton, Oregon. This crosscut was made to determine the richness and extensiveness of the ledge by the shortest possible tunnel. He expects soon to commence a tunnel on the ledge itself, which will tap it 500 feet from the surface. Mr. Parker has five men employed, who are well housed and comfortably provided for. He also has the ground prepared and the timbers out for the erection of concentrating works.

Sierra.

GOLD BLUFF MINE.—*Mt. Messenger*, Dec. 24: Work is satisfactorily progressing at this ledge. The mill is being rapidly erected. The lower steps frame is all up, and part of the building main timbers are in position. Three loads of machinery came in by Trainor last Sunday. Four loads are on the road between Camptonville and Downieville. The balance of machinery, except about a carload of piping, etc., is ready to be hauled from Nevada City, Trainor, with other teams, will have it all here within ten days. Lumber and timbers are nearly delivered. Last Sunday a number of Downieville people were up there to inspect the work, and seemed very much pleased with it. Supt Kraft is energetically laboring to get under cover before winter begins in earnest, and has 46 names on his payroll.

NEVADA.

Washoe District.

CON. CALIFORNIA AND VIRGINIA. — Virginia *Enterprise*, Dec. 25: On the 1500 level the south drift leading to the stopes has been closed. This drift has a winze connection at the south end of our mine openings with the 1650 level, and is near the point where the fire started on that level. The closing of the south drift was necessary, as the good air coming from the 1500 level, north drift, turned and went down the Con. Va. shaft to the 1650 level, then south to the point of the fire, and upward through the upraise to the 1500 level; thence through the south drift to the Combination shaft, and upward to the surface. The result of the turning of the air current was to give good air to the burning stope and increase the gas and smoke coming through the south drift to the shaft station on the 1500 level. The closing of the south drift has again turned the air, so that the combination shaft is upcast from the 1650 level to the surface. The 1500 level south drift is a level plane without any grade, and by building a three-foot dam across the drift at its mouth and turning in the water, it flows through the drift and down the upraise to the 1650 level. We feel certain this water will reach the fire and accomplish a great deal of good in a very short time. All our bulkhead work on the C. & C. side of the mine is in perfect order. The gas escaping through the Con. Virginia shaft has not increased, nor has it shown any decrease for the past three days. All ore extraction has been suspended during the week. Have shipped to the Morgan mill during the week from our ore bins 310 1270-2000 tons of ore, the average assay value of which, per car samples, was $28.11 per ton. The average assay value, per battery samples, of all the ore worked at that mill during the week (816 tons) was $29.15 per ton; 505 730-2000 tons of the ore worked was on hand at the mill, and, being of better quality than the ore shipped from the mine during the week, will account for the value of the battery samples being in excess of the car samples. Bullion shipped to Carson Mint, assay value, $18,134.73. Bullion on hand in our assay office, assay value about $30,000.

OPHIR.—1465 level—The upraise started on the sill floor, on the north side of the crosscut run east from the drift run south from the Mexican into the Ophir ground, 101 feet below the sill floor of this level, has been carried up 7 feet; total height, 45 feet, continuing in porphyry showing lines of quartz.

MEXICAN.—On the 1465 level the drift run north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south line of the mine, has been advanced 18 feet; total length, 413 feet; continuing in a porphyry formation with lines of quartz.

BEST & BELCHER.—200 level—On this level the northwest drift has been advanced 22 feet during the week; total length, 108 feet, through soft porphyry and quartz. 900 level—West crosscut No. 2 has been extended a distance of 105 feet and discontinued; face in porphyry. Started west crosscut No. 3 from top of raise No. 1, which was carried up from the 1000 level, and advanced same 12 feet; face in porphyry.

GOULD & CURRY.—200 level: West crosscut No. 5, 435 feet from main west drift, has been advanced 20 feet through porphyry and stringers of quartz; total length 197 feet. West crosscut No. 6 from main north drift has been extended 9 feet; total length, 45 feet; face in quartz. On the Sutro tunnel level, the joint north drift with Savage Co. has been advanced 15 feet during the past week; total length, 759 feet; face in very hard porphyry.

EAST BAST & BELCHER AND NORTH GOULD & COARY.—Are drifting from East Best & Belcher toward North Gould & Curry. Going through porphyry with favorable indications in the face.

OCCIDENTAL.—The upraise from south drift, 750 level, is up 51 feet; top in low-grade ore. The north drift, 750 level, has been extended 18 feet; face in hard quartz giving low assays. Crosscut No. 2 in Zadig drift, Sutro tunnel level, has been advanced 16 feet; total length, 87 feet. The face is in clay and porphyry.

HALE & NORCROSS.—We continue retimbering main shaft above the 700 level. Main Incline—Are making the necessary repairs, and are retimbering incline above the 1800 level. 1800—Advanced No. 1 west crosscut 16 feet; total length, 255 feet. The face at this distance reached the west wall and work was discontinued in this crosscut. West crosscut No. 3 was advanced 17 feet; total length, 192 feet; face in porphyry, showing some quartz. Advanced No. 4 west crosscut 16 feet; total length, 44 feet; face in quartz.

ANNAS.—On the 420 level no work has been done in face of north drift No. 1, north, during the week. Work has been confined to retimbering and repairing main north drift.

Willow Creek District.

A MILL AT WORK.—*Silver State*, Dec. 23: The merry rattle of a quartzmill will soon again be heard at Willow creek, north of Winnemucca, announcing the renewal of activity in mining operations in the old camp. The mill will be erected at the Caledonia mine, which is owned by a company of which Dr. Hanson, of this place, is one of the principal stockholders. A short time ago the company purchased the Silver Wave mill, which had not been run in years. The machinery, however, was in perfect order, and as good as new. The mill was situated about four miles from the Caledonia, and has been torn down and hauled to a site near that mine, where it will be reconstructed. J. L. O'Donnell, James Hill and Ed. Rinkel, experienced millwrights, are on the ground, and the work will be commenced immediately. It is a five-stamp mill, but more stamps will be added if returns from the ore justify it. There is hardly any doubt but what its capacity will be increased very soon, as the Caledonia is showing up well, the vein being wide and the ore rich. Shipments of gold bullion from Willow creek will soon be in order.

Alum Creek District.

NOTES.—Walker Lake *Bulletin*, Dec. 21: Johnny Dock, of Piute, is working the Nip and Tuck on a lease and is taking out pay ore. He took out 16 sacks last week of $40 ore. This mine is owned by Hatton & Box. Chas. Jump will begin work on the Johnny Dock mine next month. A lot of ore from this mine is now being worked at the arrastre. Frank Williams is doing assessment work on the Carbonate mine of Knapp & Millsaps. The prospects are

encoureging in this mine. The Red Cloud Co. (Hatton, Webber & Box) hes just completed a very comfortable cabin in Alum creek. Hacket & Hemmond are working in the Central mine. The vein in thie claim is very small, but the ore is of very high grade. The prospects are good.

ARIZONA.

YAVAPAI COUNTY PROPERTIES. — Chapparal Gulch Cor. Florence *Enterprise*, Dec. 23: Your correspondent has lately visited the different mines in this district, with the following resolt: At the Jessie, Frank L. Wright is taking out the nsuel amount of high-grade shipping ore, and is about ready to commence stoping, and expects to ship three or four carloads monthly hereafter. At the Jones mill, he found all the pipes frozen up and the mill shut down, the resnlt of the late cold snap. At the McCabe group, Mr. Packard, of Denver, and Hon. Ed. W. Wells, who purchesed McCabe's Sink to Rise mine lest week for $40,000, have 20 men at work building houses and taking out ore, of which they have shipped 60 tons since their purchase of the mine, and have about 50 tons on the dnmp waiting sacks. J. W. Cover and J. D. Helm are working McCehe's Gladstone mine under a lesse and hond, and have developed one of the greatest gold mines of the country. Their sheft is entirely in ore and they are leaving about 28 inches of ore elong the wall outside the boundaries of the shafr. This ore will sample $60 and $100 in gold per tou. A sale of this mine is on the tapis and will probably be consummated about the first of Jauuary. I also visited the Bonanza, owned by Judge J. R. Slack and Joe Mayer of Mayer station, and found they have sunk a shaft 37 feet, drifted about 25 feet and followed the drift with one stope, and have 60 tons of ore sacked for shipment and about 30 to 40 tons sorted for sacking, which all samples $165 per ton. They are now shipping the ssoked ore to Jones' mill for treatment. This mine, which they have named the Yankee Girl, is different from anything in tbe district, being entirely in a soft porphyry lime, with no walls yet in sight. The ore var es from two to four feet in width and is phenomenally rich. A grab-sample taken by myself from the dump and reduced in a pen showed approximately $100 in free gold. Another sample I estimated at $100, and a piece of herd ore, selected by Mr. Slack for me and prospected in a pan, was estimated at $500 in free gold per ton. Messrs. Slack and Meyer nndoubtedly have a very fine prospect, one of the richest it hes been my privilege to semple. A. L. Butler, formerly interested with F. L. Wingle in the Jessie lease, has taken a lease upon Henry Lang's Legel Tender mine, and has a force of men at work. Frank L. Wright has taken a lease upon the Chloride of Jack Owens. These two latter claims produced some very rich free gold ore lest seeson, and are expected to turn out veritable bonanzes shortly.

WHITE HILLS.—Kingman *Miner*, Dec. 23: The most fortunate miners in White Hills are those who are able to secure leases on some of the claims that secure rich ore. The quelity end the quantity of the ore may be estimated when it is stated that in some instances the 35 per cent royalty is paid and then from $6 to $10 is realized to the man. The White Hills Mining Co. now has on the cers, at Kingman depot, two friction hoisting works for transportation to the Hills, and as soon as these are in place there will be a show for more men to work. At present not over 40 or 50 are working for wages or contract. Most of the work done so far bas been by contract, and was all in the way of development work. Top wages have been reduced to $2.50 per day, which has caused some dissatisfaction among the miners. It is not likely that there will be any trouble over the reduction.

EUGENE CAMP.—Another coming rich camp is Eugene Camp on the opposite side of Sacramento valley. There the Horn Silver and Eugene mines rival the best mines in White Hills, the ore in its richness and general physical charecteristics bears a close resemblance to the Occident mine in White Hills. On the Horn Silver the main shaft is down 60 feet, and Messrs. Washington and Maloney heve a contract to sink it 100 feet for the ore they take out in sinking, and it is no mean prospect that better then contract wages can be made by sinking, and it costs $30 per ton, too, to get the ore hauled to Kingman. Eugene Camp has some 20 men, a new boarding-house and a good show to become as good a camp as there is in the Territory, notwithstanding that, like White Hills, water is scerce and high.

SILVER.—Jack Gibbons and Ed. Mervine are reported to have discovered a rich silver ledge in Aubrey district, about a mile and a half due west from Groom's Peak. The ledge is five feet wide, the ore of gray copper and runs 275 ozs. in silver per ton. It is said by old-timers that this was a lost ledge and that a number of prospectors have eearched for it off and on for the past 20 years. Parties who have seen the ore say it will rivel eny strikes made in Indian secret district or anywhere else.

MINING AT PIONEER.—*Enterprise*, Dec. 23: John Newman, Esq., bought his partner's (A. Finlayson) interest in the Pioncer and other mines in this camp on the 28th of lest month, and is now sole owner of most of the mines in this cemp. John has several bodies of high-grade ore in sight, and hundreds of tons of low-grade that he will have worked in Globe, at Klein & Co.'s mill. Kelly & Reinhart have struck a fine body of very high-grade ore on the ground that they have leased and will soon have out a large shipment. Donivan & Bartlett shipped several tons of rich ore a few days ago and are still taking out plenty of the white metal. Miller, Payton & Co. will soon ship a carload of rich ore to El Paso. Gordon & Norton have made a rich strike on the North Howard. Geo. Bird & Co. are doing well on the Old Pioneer mine and will ship as eoon as silver comes up a little higher. There are several men making good wages assorting and screening the old dnmp that the company took out years ago. Newman expects to put in a pumping plant in the spring, so as to work ont the high-grade bodies of ore that are known to he below the water-level.

BRITISH COLUMBIA.

THE NEW CAMP OF LARDO.—Butte *Inter-Mountain*, Dec 23: Mr. F. E. Ward left the camp of Lardo two weeks since. According to Mr. Ward, it was only discovered last Septemher. It is about 200 miles north of Spokane. From Bonner's Ferry one can go hy eteamhoat and rail and steamhoat to Kalso, on Kootenai lake, thence across the lake 20 miles hy boat, and from the head of the lake to the Lardo region it is 60 miles, and not a sign of a trail or road. Over this 60 miles the proepector must walk and carry his blankets, gruh and tools along the Lardo river to the mines. Mr. Ward made the trip last September and has no cense to regret it. He was among the first to get in, and eucceeded in getting what he considers valuable property. The leads thus far discovered were found in a lime and slate contact. The lime dike tends northeest and sonthwest, is from 1500 to 2000 feet in width, and rises up nearly perpendicular to a height of 2000 to 3000 feet, and is nearly as white as snow. The slate is black. The surface ehowing, Mr. Ward says, is the greatest ever known. The Abbott claim, chief of the C. P. R. group, he says, has 40 feet of galena ore that has an averege value of 80 ounces of silver to the ton. All the ore, thongh galena in character, runs high in gold. There is an abundance of timher and plenty of water. The timher is described as very fine. The mountains are covered with cedar trees eight to ten feet thick at the butt, and towering 100 feet withont a limb. From Lardo to the Canadian Pacific it is 75 miles. There is not a sign of a trail or road, hut the Government is now building trails for peck animals, and within a year it is thought railroads and wagon-roads will be constructed. The Cenadian Pacific will probably huild down the Lardo river, and the people of that section are confident Jim Hill will construct a branch roed north from Bonner's Ferry. The trade is already very heavy, and there are not enough steamboats on Kootenai lake to transport the goods to Kaslo, and in the winter nearly all freight treffic is snspended, owing to the ice. More than 30 locations have been made on the great coutact vein of Lardo, each 1500 feet square.

COLORADO.

ASPEN SHIPMENTS.—Aspen *Times*, Dec. 24: The railroads report the shipment of 3113 tons of ore for the week, au increase of abont 1000 tons over the ureceding week. There is no reason why it should uot be double this amonnt unless it is the continued depression in the silver market. The bonanzes themselves ere all looking unprecedentedly well, and are probably, at the present time, cepable of furnishing a larger amount of ore to the market than at any period since they begau their career. The low price of silver and lead, however, has been a sonrce of embarressment that they conld not overcome, and the result is seen in the curtailed shipments. However, the shipments are very favorable, and Aspen can rest its reputation upon them.

IDAHO.

THE BEDROCK FLUME.—Cor. Idaho *Statesman*, Dec. 23: Benjamin Williams, who has been in the Basin for several weeks prospecting the placer ground in Grimes and Granite creeks to ascertain whether it will justify his company to put in a hedrock flume, will soon leave for Engla.d. As near as can be ascerteined the prospects were very satisfactory, and we ell hope and expect to see the work of putting in e flume commenced early next spring. The sand washed down from the hydraulic claims on the mountain sides all prospected much better than was expected, while the ground in the creek beds wes found to be good. This is one of the greatest enterprises sterted for the benefit of the country, as we all know that it will pay handsomely and bring capital for investment in other enterprises. The trustees of the Boise County Mining Company are making arrangements for the purchase of new machinery, so that when work is resumed in the shaft it can be continued without interruption until the granite bedrock is reached.

MEN LAID OFF.—Wood River *Times*, Dec. 21: About 25 men have been leid off at the Red Elephant group of mines. Only 50 or 52 men are therefore employed there now. They are all working in ore, however. The output of the property will, therefore, not be curtailed at present. Most of the men laid off were $4-a-day men. All of them were doing dead work. They were laid off for three or four months. Colonel Bryan, maneger of the [G. V. B.] Company and principel owner of the property, says the outlook for silver is so unsatisfactory and unpromising that he does uot feel that he can afford to pay at present for any work that is not indispensable. This will continue as long as the present low figures for lead and silver shall rule.

RICH ORE.—Last Saturday a strike was made in the Goffre claim which, had it been in almost any other region, would cause a great rush there. The men at work there ran into mineral that has the appearance of a blue, ehiny talc all covered with green. It is filled with bromides and becomes bright on rubbing. There is a width of eight inches of this which assays $4987.50 per ton. The discovery was made at a vertical depth from the surface of 227 feet. The ground ie ao soft and kindly that the men had run about 42 feet in three days. The ore showe up in the top and bottom of the drift, carries some zinc, and gives every indication of permanency. A crosscut is being run at a depth of 109 feet below the above drift. As soon as the proper place is reeched, a raise will connect the crosscut with the drift above and a more reliable opinion of the extent or size and valne of the ore body can then be formed. The Goffre cleim is located at the Bullion divide and in the very heart or center of the most productive section of this region. The Goffre is owued by the Pass Miniug Company of New York city of which H. K. Thurher, the well-known millionaire head of the Thurher–Whyland Co., is treasurer. Nathan Randall is the snperintendent, and has charge of operations at the mine.

THE CLIFF.—Idaho *Avalanche*, Dec. 23: This property, on the eastern slope of Florida mountain, is owned hy John Way, Fred Harris and Sheriff McCehe. They have three claims which adjoin the Miller & Walters mine and the Naked Truth. Something over 800 feet in tunneling has been done on the property, and a fine body of ore has recently heen opened. An assay made recently on an inferior sample run 604 ounces in silver and 10.20 ounces in gold, or $808 per ton. The rich streak is from 7 to 12 inches in width. Several tons are now on the dump and a mill-run will soon he made.

BLACK JACK.—A large force of miners is at work on this property, and the mill is running eteadily. The work in the mine consists of drifting south on the ledge and in stoping. The mill is doing excellent work. There is a report in town that John Feonr and Taylor Gearhert have struck a fine body of ore in their claim ou Florida mountain, where they have been working the past summer. The strike is said to be rich and in snfficient quantity to be valuable.

BLAINE.—The tunnel hes reeched a length of 2075 feet, and is being pushed as rapidly as possible hy three eight-hour shifts. The stope is looking fine and has abont 12 inches of $250 ore. The face of the drift is in fair quartz.

TRADE DOLLAR.—There are 26 men on the payroll. Stoping is being done in the uorth drift of the 100-foot level of Winze D and in tunnel No. 3, over the winze. The south drift of the 100-foot level is being driveu also. The mill made a cleanup this week and has shut down for want of ore. As nearly all of the milling ore has to be hoisted by hand, it is impossible to keep the mill running steadily. The mill will he started again about the first of January. Dunham has two teams hauling quertz from the Black Jack mine to the mill. Three teams are uow engeged in hanling ore from the Phillips & Sullivan mine.

NEW GOLD FIELDS.—Elmore *Bulletin*, Dec. 23: Dr. Sawyer has discovered good placer diggings on the head waters of the Bruneau, a stream that empties into Snake river about 20 miles south of Mountain Home. This is known to the prospector as the Bruneau country. The doctor spent all his time last summer in exploring this region to determine the value of the dirt in a plscer belt on which he had taken an option. He found the earth very rich turning out from two to 25 cents per pan of the precious metal, and it was not unusual to pick up nuggets worth $25. There is a large stream that empties into the Snake river which effords plenty of water, and a fall of 1000 feet can be had for hydraulics. There is a ten mile ditch and 2000 inches of water. Two men have been washing gold in the gulch for several years, taking out $750 in the couple of months that they can utilize the snow water. This they deemed an ample return for their wants, being few in the simple life they fol lowed, 50 miles away from civilization.

NEW MEXICO.

INCREASING OUTPUT.—Silver City *Sentinel*, Dec. 23: The output of the mines in the Hillsborough district is increasing, and the total output last week was over 400 tons of ore. The Staudard Company's mines are producing ore enough to keep two mills running steadily. The concentrator at the Stephenson-Bennett mines, in the Organ mountains, is nearly completed, and it will be started next month. There are about 6000 tons of ore out at the mines, and it will he treated at the rate of 50 tons a day. Pete McDermott shipped 30 tons of high-grade ore from his mine near Carlisle last week. The ore will average about $100 per ton, and has all been taken out in doing development work on the mine. He is still working in fine ore. The mines in the Tres Hermanas are producing ore in small quantities, and shipments of good ore in smell lots are being made from the camp at regular intervals. Most of the ore from that camp is being shipped to the Deming Sampling Works. The assay office of the Deming Sampling Works, which was burned recently, will be rebuilt at once. Development is being pushed on the Jim Crow mine in the Carlisle district, and the indications are good for a veluable body of ore. Wheu the development work, now coutemplated, is completed, the purchasers of the mine will have a pretty good idea of the extent and value of the ore depoeit. Developmeut work is going on at the Mangas Mining Company'e property, but a mill will not he erected until there is a hetter proepect for a higher price for silver. The company has a large body of ore in sight, hut there would be little profit in taking it out and reducing it at the present price of silver. W. S. Hopewell will put up a 15-ton Hontington mill near the Homestake mines, on the Animas river. The machinery for the mill has been shipped from Lake valley to its destination. The new mill will be just what the miners of the Animas Peak district have been wanting for a long time. The ore from the mines there can be treated in the new mill much cheaper than it can be shipped and treated elsewhere. Miners at Cook's Peak are considerably concerned on account of the low price of lead, and shipments from the camp are falling off. With lead at four cents a pound, the mines there can be worked at a handsome profit; but with lead at 3.70 to 3.75 and silver at 85 or lower, the ore produced from the mines there pays little or no profit. Cook's Peek is the largest lead-producing camp in New Mexico, and if the miners there have to close down, the lead miners of New Mexico will not he so lond in the praise of the McKinley hill as some of them have been this year. Bullion is coming in on the stegee from Silver creek regnlarly from the Maud S mill. The Maud S is by far the largest producer in the Silver Creek district, and the property is being handled at a handsome profit. The company has a larger force of men at work than has ever heen employed before on the property, and from present indications the mill can be kept running steadily during the coming year. The mill has a capacity of about 35 tons of ore daily. The Silver City Water Company has had a snfficient supply of water for several weeks to furnish the Pacific m ll here, and the mill will he started up as soon as the vanners, which were taken out of the mill and taken to Pinos Altos lest summer, can be replaced.

CLIFTON.—Silver City *Enterprise*, Dec. 23: J. W. Fleming, who is back from Clifton, reports that the Clifton Company is now turning ont, on an averege, 11 tons of copper per day. About 200 tons of ore per day is taken out of the mines. The Church Company will soon resume operations at Morenci. The town of Clifton seems quite prosperous.

CARLISLE.—*Western Liberal*, Dec. 23: Pete McDermott was down from Carlisle this week with a shipment of 30 tons of high-grade ore, which he calculates will run over $100 per ton. His mine is still in bonanze; the last 40 feet of sinking took out ore worth $100 per foot. He has not done any stoping, all the ore he has taken ont being in developmeot work.

SOUTH DAKOTA.

FORTUNE'S LYING IN WAIT.—Deadwood *Pioneer*, Dec. 24. The history of the mining industry of the eerly days around us shows that the hills adjacent to Deadwood eastward have not had the development required to prove their exact value. Free-milling ore was the kind sought, and the refractory being predominant, the small mills, crude and ignorantly worked, failed to produce the results sought, and new fields southward being rushed, the regions of Spruce, Two Bit, Little Two Bit, Strawberry and other now well-known gulches, were nearly abandoned, and Bald Mountain, Ruby Basin, the Homestake mines, and other rich districts became the lodestones to prospectors and miners. The Strawberry mines, the Oro Fino group seem to be leading now in all reports. Beld Mountain and Ruby Besin hold their most valuable repntation and continue to produce rich rock. The Homestake mills reduce by their 2000 stamps their usual low-grade ore. Bnt laurels are not made simply for one section. Sometimes the seemingly deserted are the most conspicuous because the more brilliant, and capture them. Frequently, for reesons, one section is passed by for the elevation of another, but which, biding its time, comes out of the gloom of retirement, shining and beckoning and alluring. This seems to be the cese with the Spruce and Two Bit districts, where it is stated richer ores are than have yet been found anywhere except at Strawberry. Gold, silver and lead are the ores of these sections, and they appear in vertical veins of great width, in 30-foot stratas and thick blanket seams. Thousands of tons of rich, free-milling rock and also of refractory ore are said to he in sight in single claims. The value of such bodies of ore are well appreciated by all acquainted with the actual value of mines.

CONCENTRATES.—The J. R. mill was again sterted for a winter run by steampower with plenty of rich ore in sight to make the company rich. The old stations on Spruce creek will prove of immense value. Great faces of free-milling rock are reported uncovered, which have a low average of eight dollars. The Two Bit mines are reported to be very rich from late developments. A scheme is on foot to prove their exact value, and to investigate the statements that bodies of very rich ores have been uncovered. Foreman Bishop of the Oro Fino mine was in town, and expressed himself as more than well pleased with what the mine is doing. A strike of unusually rich ore is said to have been made in the old workings of the Blossom (formerly Lookout) mine. At last accounts the ore body was 60 feet wide. The mill is closed down for the winter, the flume having frozen np. Concentrators will be added during the winter. The Oro Fino is away ahead of itself up to date, if all reports are true. It is stated that no ore has yet beeu found to reach the value of some produced from below at these mines within the past week or ten days. "It is out of sight" for richness in gold, silver, and lead. We hope to be permitted to give detailed reports with reference to this bonenza spot. J. S. Childs, superintendent of the Harney Peak compeny, was in the city and reports matters as entirely satisfactory at Harney. The work is progressing as nsual and arrangements are heing made to begin shipping concentrates next month to Aurora, Illinois, or to New Jersey, the destination not having been definitely determined. Foreman Rossiter accompanied Mr. Childs to the city.

UTAH.

THE SAN JUAN COUNTRY.—Two well-known parties have returned to Flagstaff, A. T., from the San Juan plecer mines. George P. Thornton, formerly connected with Park City, Utah, mines, thinks there is gold there, but says it is not a poor man's camp. He and his associates located about 20 claims in a place which he thought could be worked the most economically of any there, and he calculates it will cost them $2000 to commence operations. The story of fabulous sums having been already taken out is a myth. Wm Babbitt, of the well-known firm of Babbitt Bros., the other party returning, while he does not claim to be a practical miner, thinke the reports have heen greatly exaggerated. There are three camps aloug the

river. The first is 25 miles from its mouth, where a syndicate of Winslow capitalists and Atlantic and Pacific Railroad officials hold about 400 claims. At this point there are about 200 men working, putting in machinery and tunneling to turn the river preparatory to mining. Twenty-five miles farther up is another camp of about 20 prospectors, and 50 miles farther up still another camp of prospectors, the latter being only 15 miles from Bluff City, Utah, where lumber and supplies can be had comparatively cheap. So far as can be ascertained, no golddust has been brought in as yet. Flagstaff is the most convenient point from which to reach the main camp, as there are plenty of conveyances to be had and the route from there is well supplied with water. A correspondent of an Arizona paper says: "Pay dirt is taken from the top, and at no place along the river to a point 50 miles above but from 15 to 20 colors can be taken from a pan. The location is an isolated one, and no communication can be had only by special messenger. In the meantime, people are flocking to the placers."

Market Reports.

Financial and Commercial Review.

SAN FRANCISCO, Dec. 29, 1892.

SILVER—Refined silver sold in New York, Thursday, at 82¼c and in London at 38¾c. News comes from Utah that owing to the continued low prices of silver and lead the Niagara group of mines, at Bingham, on which over $50,000 is invested, have been shut down, and the managers of the Old Jordan group have notified their men that they will have to accept a reduction in wages on January 1st or find themselves out of employment. A general reduction of miners' wages throughout Utah is threatened. In other parts of the coast mines have had to shut down, and it is difficult to dispose of silver properties.

QUICKSILVER.—There is no change to note in the regular prices.

BORAX—Prices continued the same as for some time past.

ANTIMONY.—Nothing of interest has developed in connection with this metal and prices are unchanged.

LEAD—Is firm at the low price of $3.85 per hundred for domestic.

TIN—The market is quiet; price for Straits is $19.50.

COPPER—The market remains steady and Lake is quoted at $12.30. Captain Thomas Couch manager of the Boston and Montana Mining and Smelting Company, in an interview stated that a major portion of the reduction of the ores of the company would be done at the works in Great Falls, Mont., as it could be done cheaper than elsewhere. He also stated that the copper mills of the company would probably not shut down in spite of the copper combine.

Mining Share Market.

As usual, holiday time affected the stock market, which continues dull, with low prices. The fluctuations, such as they are, did not show any decided advance or decline until Thursday morning, when there was an advance under free purchases. At the 9:30 A. M session of the San Francisco Board, that day, the total sales were nearly 10,000 shares, the largest business of any session for quite a time past; and at the informal session which followed, the business continued large. During this revival, Consolidated California & Virginia and the neighboring north-end stocks were the most active features of speculation, but Potosi and the other middle stocks, and Belcher of the Gold Hill group, came in for a large share of attention. The market had a better tone than for several weeks.

Should the pumping association start active operations on the Comstock, and relieve the lower levels of water, there would doubtless be more interest in many stocks. There is a big hydraulic pump in the combination shaft of the Chollar, Potosi, Savage and Hale & Norcross Mining Companies, which, it is expected, will soon be in operation. The shaft in which this pump is located has a depth of 3300 feet, but it is filled to a depth of 1500 feet. Another large pump is located in the Union shaft belonging to the Sierra Nevada, Union and Mexican Companies. It is the object of the association to have the Fair, Sharon and Haywards factions pool their issues and relieve the mines of this vast body of water. There are excellent prospects in all the mines now under water, and particularly in the Belcher, Exchequer and Crown Point mines. Should this water be removed, and operations be begun, the stock market would decidedly improve.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 20, 1892.

488 431.—WRENCH—J. H. Gregory, Ione, Cal.

488,276.—STREET CAR FENDER—G. T. Hall, Monrovia, Cal.

488,434.—PISTON-ROD PACKING—J. B. Houston, S. F.

488,476—CAN-BODY-FORMING MACHINE—R. D. Hnne. S. F.

488,337.—NUT LOCK—S. A. Lake, Lakeview, Wasb.

488,524. — FEED-WATER HEATER — J. MacDonald, Los Angeles, Cal.

488,479.—PAINT—A. L. Munson, East Oakland, Cal.

488 248.—NON-HEAT-CONDUCTING COVERING—W. H. Norris, Spokane, Wasb.

488,483.—GAS ENGINE—J. W. Raymond, S. F.

488,232 — ANIMAL TRAP—O. S. Ward, Los Gatos, Cal.

488,411. — SLATE ATTACHMENT — Maud S. Wyman, S. F.

22,060.—DESIGN FOR SPOON—G. B. Stocking, Tacoma, Wash.

22 196.—TRADEMARK—M. E. Ogborn, S. F.

The following brief list by telegraph, for Dec. 27, will appear more complete on receipt of mail advices:

San Francisco—Caffran J. Hall, hydraulic elevator, Frank Lawrence, safety locks for gas cocks; Frank M. Ryan, car coupling; Allen E. Scott and J. W. Wright, billiard table; Josiah H. L. Tucker, Stockton, cable.

California—Dr. F. Oliver, Oakland lamp support; Edward Sempel, Alameda, batter cake mixture and depositor; Herbert L. Weitzel, Oakland, auxiliary steering gear.

Arizona—Joseph L. Giroux, Jerome, cable tramway.

Oregon—Samuel J. Galloway and G. P. Cramer, Plainview, car coupling; Clark Taber, Sumpter, water wheel.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CLIP FOR ROPEWAYS.—Bartlett McIntire, S. F., assignor to the Vulcan Iron Works. The invention is one of that class of clips designed for connecting load-carriers with endless traveling ropeways, in which the end of the body portion of the clip makes connection with the cable by entering between the strands. These ropeways are designed for the transportation of material from one point to another. The material is contained in suitable carriers or receptacles suspended by means of hangers from clips which are connected with the wire rope or cable of the way. These clips are made to connect with the cable in various ways. Some forms of clips were provided with flexible leaves connected with the body portion, and embracing and encircling the cable and clamped thereon. Other clips were made some to enter and some to pass through the cable between its strands. This new clip belongs, as before stated, to that class in which the end of the body portion of the clip enters between the strands of the cable; and it consists in a clip having the end of its body portion provided on its under surface with a groove, on its upper surface with a groove, both grooves being inclined or spirally directed, and its extremity beyond said grooves formed in a straight hook. The end of the clip enters the cable, its grooves partially embracing and conforming to the lay of adjacent strands, and its hook end partially embracing the soft core or heart of the cable. This clip can be readily and firmly connected with the cable of a wire ropeway.

CAN-BODY-FORMING MACHINE. — Robert D. Hnme, S. F, No. 488,476. Dated Dec. 20, 1892. This is an improvement in machines for forming sheet-metal can bodies. The object of the invention is to provide an improved means for closing lock seams which form the longitudinal junction of the meeting edges upon the side of a can-body. This mechanism may be applied to any can-body-forming machine in which a mandrel or horn is employed, around which the body is formed. The invention is designed simply to close the seam which is formed upon the can-body in any well-known machine already in use.

GAS ENGINE.—John W. Raymond, S. F. No. 488,483. Dated Dec. 20, 1892. The mechanism described in the patent enables the inventor to open the inlet and exhaust valves independently of each other by cams upon the single shaft in close proximity to the valve stems and the head of the ignition chamber, and adjustable springs will close the valves with a rapidity proportioned to their tension. This in the inlet valve may be made to act as a cut-off to regulate the amount of explosive gas admitted to the cylinder. By opening the inlet valve by direct pressure of a cam, the explosive gas is admitted freely and in larger quantity than when the valve is opened by the vacuum produced by the movement of the piston, and compression commences immediately when the piston begins its return stroke. The ignition chamber is shallow, and the inlet and outlet valves open directly into it, so that all the products of an explosion will be entirely expelled when the piston returns after the explosion has taken place.

ANTI-FOULING PAINT.—Anson L. Munson, East Oakland, assignor of one-half to Thos. G. McLeran, S. F. No. 488,479. Dated Dec. 20, 1892. This is one of that class of antifouling paints in which mercury is used. It is composed of a pigment, mercurous chloride and a vehicle consisting of coal tar, chloride of zinc and oil of turpentine in certain proportions.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco.

THE FRALEY ELECTRIC COMPANY. Capital stock, $1,000,000. Directors—J. P. Jackson, J. B. Fargo, J. Conch, Solon Pattee and George A. Bell.

MOKELUMNE RIVER MANUFACTURING COMPANY. Object, to manufacture lumber. Capital stock, $2,000,000. Directors—J. H. Logan, I. L. Thurber and F. L. French of Santa Cruz, and J. S. Storey and Frank Ashton of San Francisco.

THE EL DORADO LINSEED OIL COMPANY. Directors—Edward L. G. Steel of Oakland, John McKee, D. E. Colton, George A. Moore and Ed. Polhemus of San Francisco. Capital, $100,000.

THE WESTERN TRANSFER AND STORAGE COMPANY. Directors—S. R Church, F. H Belcher, George E. Maguire, Hallock Wright and Thos. Walters. Capital $1250, all subscribed.

THE LETHENT WATER AND LAND COMPANY. Directors—Wm. Strader of Coalenga, Fresno county, and George L. Brown, D. Gilbert Dexter, A. J. Robinson and G. B. Davidson of this city. Capital, $5,000,000.

Board Sales of Mining Stocks.

Unitarian Literature

Sent free by the CHANNING AUXILIARY of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address Miss S. A. Hobe, as above.

DIVIDEND NOTICE

GERMAN SAVINGS AND LOAN SOCIETY, 526 California Street. For the half year ending Dec. 31, 1892, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent per annum on Term Deposits, and four and one-quarter (4 1-4) per cent per annum on Ordinary Deposits, payable on and after Tuesday, Jan 3, 1893.

GEO. TOURNY, Secretary

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION, 532 CALIFORNIA Street, corner Webb; Branch, 1700 Market Street, corner Polk.—For the half year ending with Dec. 31, 1892, a dividend has been declared at the rate of five and one-tenth (5 1-10) per cent. per annum on Term Deposits and four and one-fourth (4¼) per cent. per annum on Ordinary Deposits free of taxes, payable on and after TUESDAY, Jan. 3, 1892. LOVELL WHITE, Cashier.

WADE & WADE,
Analytical Chemists and Assayers.

ESTABLISHED 1887 — 109½ COMMERCIAL ST., LOS Angeles, Cal. We have fitted up the best laboratory in Southern California and are prepared to make Assays and Analyses of all Metals, Minerals, Ores, Waters, Fertilizers, Etc. ASSAYING TAUGHT.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

☞ SEND FOR CIRCULAR.

E. P. HEALD, President.
C. S. HALEY, Secretary.

ACTUAL BUSINESS PRACTICE.

Established 1863 — **PACIFIC Business College, 320 POST ST. SAN FRANCISCO.** — No Vacations.

LIFE SCHOLARSHIPS, $75.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, Pres.

MINING AND SCIENTIFIC PRESS.

The Leading Mining Journal in America. Established 1860. Latest Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.
